There was a jolly gathering of yachtsmen at the town house of the Hull-Massachusetts Y. C. on the evening of Oct. 4. The Regatta Committee and the Board of Judges jointly invited the prize winners and their friends to be present at an informal dinner, at which the cups were given out. There were nine of them in all, and every one was a beauty. Six of these were raced for in the midsummer series. These were presented by Mr. Thomas W. Lawson. Three were for the champions of the 25ft. 21ft. and 18ft. knockabout classes, respectively. The cup for 25-footers was presented by Com. E. P. Boggs; that for 21-footers by Vice-Com. E. P. Boynton, and the cup for 18-footers by Mr. George H. Wightman. There was plenty of cheering as each successful yachtsman was presented with his cup, and a most pleasant evening was enjoyed. JOHN B. KILLEEN.

YACHT CLUB NOTES.

At the annual meeting of the Huntington Y. C., the following officers were elected: Com., Henry H. Gordon; Vice-Com., George Taylor; Rear-Com., J. W. Ailkin; Treas., H. H. Gordon; Sec'y, Daniel Wood; Trustees, August Hecksher and John P. Kane.

The Herreshoff Mfg. Co. is building for Mr. Morton T. Plant three new boats, all of which are of good size. The smallest is a cruising sloop 34ft. on the waterline; a steam yacht of 110ft. waterline, which is practically finished, and is to be launched in a few days. The third vessel is to be a schooner, and her frames will be set up as soon as the steam yacht gets out of the shop.

A New Cruising Schooner.

THE first order for a yacht of any size to be placed this fall with a builder in the vicinity of New York city, has been awarded to Mr. Robert Jacob, of City Island.

Last winter Mr. Jacob built a cruising schooner 63ft. on the waterline for Mr. Frank L. St. John. The yacht was so satisfactory that Mr. Henry C. Winteringham, who designed her, decided to give Mr. Jacob the order for the new schooner, which is to be some 5ft. longer on the waterline.

The new boat is for a gentleman who has been identified with yachting for a long time, and for a number of years past has owned a schooner of the old type, which he disposed of last year. Like the St. John schooner, the new yacht will be built entirely of wood, and she will have a centerboard which will house under the cabin floor, so that it will in no way interfere with the accommodations below decks. She is to be 98ft. over all, 68ft. on the waterline, 20ft. breadth and 9ft. draft with the board up. There will be about thirty tons of outside lead ballast. The new boat is essentially a ship in every particular, and will undoubtedly make a fine cruising boat. Her good breadth and powerful section insures great stability. The overhangs will be moderate in length and well proportioned. The freeboard is liberal, and the 14in. bulwark will give a sense of security to those on deck. The sail plan is not large, and reefing will hardly be necessary. The rig does not call for large spars, and the boom will not project much over the taffrail, nor will the bowsprit extend any great distance beyond the gammon iron. The sails will be probably made by an American firm. All the deck fittings to be used in connection with the rigging are to be of bronze.

The deck will be of selected white pine, and the rail, gratings, waterways, coamings, hatches, skylights and companionways will be of teak.

The cabin arrangement will be unusually good, and was laid out under the direction of the owner. Colonial lines will be followed in the woodwork and hangings. The woodwork, such as partitions, trim, etc., will be of white pine painted ivory white, while all doors, bureaus, dressers, tables, etc., are to be of San Domingo mahogany. The carpets on the floors of the saloon and staterooms will be of rich green, and the hangings at the doors and skylights are to be of green velour.

Coming down the companionway a good steerage will be found from which all the owner's and guests' quarters may be reached. The floor of the steerage will not be carpeted, but will be covered with some serviceable material, which will not be injured by getting wet if the companion should be left open in bad weather. Directly aft, extending the full width of the vessel, is the after cabin. The room will be unusually large, and well equipped. On each side are transoms, behind and above which are wide berths. On the after partition will be placed a roomy bureau, above which is a mirror. On each side forward of the berths there is to be a closet. The one on the starboard side is to be a hanging closet, while the one to port will be filled with skeleton drawers. On the forward partition to starboard a door will open into a bathroom, and on the port side a door will lead to the passage or steerage. The after cabin is to have a large flat-topped hatch overhead, with glass windows on all four sides.

On the port side of the passageway aft will be the chart room. In front there will be a transom and back of this will be drawers, large ones for the charts and smaller ones for navigating instruments. On top of the chest of drawers will be a large table, so that charts can be spread out and referred to continually if necessary. Forward of the chart room will be a guest room of good size. It will be fitted with a wide berth, transom, bureau, hanging closet and set wash basin. Opposite the chart room on the starboard side there is to be a bath room, which will be equipped with a porcelain tub, wash basin and patent closet. Forward of the bath room will be the owner's stateroom. The room will be very large and fitted up in the best possible manner. There are to be large closets, a five-foot bureau, set marble wash basin, lounge, etc. A skylight overhead will make this room very light. Forward of this will come the main saloon, which will run the full width of the boat. On each side will extend wide transoms, back of which are to be lockers for linen, silver, etc. On each side at the forward end will be a buffet for glassware, wines, etc. The cabin table will be placed on the port side aft. The piano will be secured to the after partition. Above there is to be a skylight 4ft. 6in. square. It is to be made square, so that it can be placed athwartships if desired and better ventilation secured below.

Next forward will come the galley, pantry and mess room, all in one. This apartment is to be very large and will be completely fitted. On the starboard side is to be the sailing master's room. In the port corner of the galley aft will be an inclosed water closet for the captain. Forward will be the forecastle, where the eight men that make up the crew will have very comfortable quarters. In the eyes there is to be a water closet for the crew. The chain locker will be under the forecastle floor. The lazaretto will be aft and will be reached from the deck by two hatches.

Three boats will be carried on the davits, a dinghy, a cutter and a large powerful launch, large enough to tow the yacht in case of calm weather.

The yacht will be turned over to her owner early next season, and when completed she will be one of the most complete and best-fitted cruising yachts of her size in American waters to-day.

BOATS SUCCESSFUL IN THE MASSACHUSETTS Y. R. A.—SEASON 1902.

Melody—A Successful South Bay Catboat.

THE catboat Melody was designed and built by Mr. Gilbert M. Smith at Patchogue, and launched in June, 1900. She was built for Mr. Harry Growtage, of East Moriches, L. I. The yacht has raced under the Moriches Y. C. colors. The photograph we publish of Melody in this issue shows her under reefed canvas. The following outline of her racing during the last three seasons is of interest:

Melody was beaten in match race early in June, and won the following Saturday by a close margin. Her next race was in the regular club regatta, beating the fleet by over a minute, and repeated her victory in the following race. Next week Melody tried her luck in foreign waters and raced at Shinnecock. Won first in class A, and the Queen of Bay plate for best corrected time in all classes, which plate she now holds. On Aug. 11, same year, she won the open regatta of her own club, defeating her rival Dodo 48s., and followed this up by winning the Gunning Point Challenge cup. In the handicap race for the McAleenan cup, this year, she was unsuccessful, as she had to allow all club boats from one to ten minutes.

Her second season did not start off so successfully, taking second place in club regatta, and the same position the second week at Westhampton, then a win the following week in special members' race. On Aug. 31 of this year at Westhampton, she again proved her weather abilities, defeating twenty-two boats in the open regatta, in a strong east wind, and Monday following won the McAleenan handicap cup for the first time.

1902 opened successfully, placing the Shinnecock Club race to her credit, beating the new "Gill" Smith creation Argo by 3m. 55s. Aug. 9 at Westhampton found her again leading the fleet, winning first prize in class A and the Challenge cup in this class also. Next week, at Moriches, again a winner, being across the line 1m. 21s. ahead. In the Members' Regatta, Aug. 20, for special cup presented by Com. Dr. William Carr, Melody won again, but at Shinnecock had to be content with second place. Aug. 27 in race for McAleenan cup, she won this trophy for the second time.

Probably the greatest victory in her racing career was won at the open regatta, Westhampton Country Club, winning her class prize handily by 2m. over second boat, and the Queen of the Bay cup, presented by the Commodore for best corrected time over the course in three classes of catboats.

Her last win on Labor Day at Moriches was a surprise. Always considered a light-weather boat, her chances were considered very slim in the howling gale from the S.W. A bad start handicapped the boat somewhat, as she poked her mast across the line just 1s. ahead of gun. The second time to windward under double-reefed sail, she passed her class and won by 31s.

Seventeen Days' Cruise on Long Island Sound.

BY THE CREW, THE SKIPPER AND THE OWNER.

(*Continued from page 295.*)

July 30.—This day was to be a day of cleaning ship, filling water tanks, polishing bright work, and doing the various little jobs that are always necessary aboard. The Owner decided to run into town (so he would not be in our way). As soon as he was gone the Skipper took her in to the float stage to fill her two 40-gallon tanks with fresh water. It is not doubted that some of the readers of this log have been in the same predicament as the Skipper was in, which was as follows: Wind, fresh, blowing right on to the float stage; tide running strong flood; the float stage, with the usual outfit of small boats on every side; the usual dozen or so of people chock full of advice, and last but not least, our big bowsprit. Very easily did we run in to within about 100ft. of the dock under our jib, when the Skipper shouted, "Take the jib off her." Down came the jib all right, but her headway

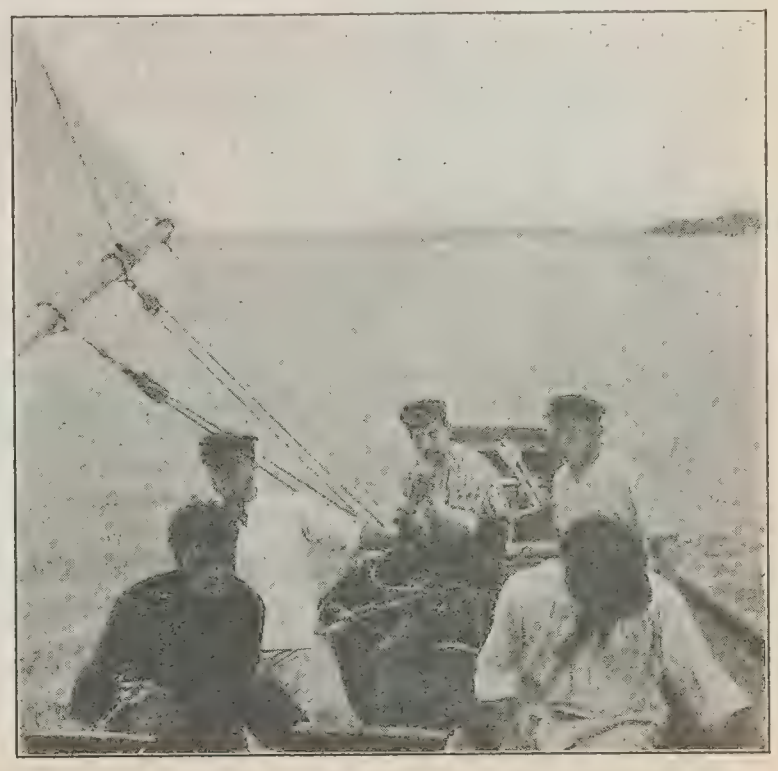
MELODY—DESIGNED AND BUILT BY GILBERT M. SMITH, PATCHOGUE, L. I., N. Y.

was not checked sufficiently to stop at the exact spot where the Skipper had been informed the hose was; consequently there was a lot of backing and hauling—and swearing—and advising, but the Crew with the assistance of the dockman, succeeded in getting her out far enough to drop the hook and let her drift back comfortably, and we then filled the tanks. This done, we had the same difficulty in getting away from the float. It would be too much bother raising the mainsail, and with the Crew and dockman towing we managed to get out far enough to ride at our anchor with comfort. The Crew had certainly worked with celerity and quick-wittedness, and he is all right in this respect; indeed, none better; and the few words of commendation from the Skipper seemed to make him more docile than usual. As the Skipper lighted a cigar and stretched himself in the cockpit, he mused how easy it would have been to pick his way through the rowboats, full speed astern, not having to gather way with a glass show case launch 20ft. on the port hand, and a wicked bunch of spiles on the other. Thus ruminating, the Skipper began to wonder what had become of the Owner. It had been the intention to sail for the Thimbles, as it was only a short run, and it would be an absolute crime not to lay in that picturesque spot for at least one day. Neither Skipper, Owner nor Crew had ever dropped hook in there, and the Skipper did not want to let the opportunity go by. So we patiently waited for the Owner's appearance. The wind was blowing about six and from the south'ard, and it seemed a pity to be chafing at anchor. The Crew suggested starting without him, but this the Skipper thought was hardly feasible. It was now seven bells and the tide was ebb, wind seemed lightening, and still no Owner. The Crew prepared some sandwiches, and we had a bottle of beer apiece. 'Twas then we heard the tiny whistle that the Owner was wont to carry with him to summons his ship's company on occasion. We had him aboard in a jiffy, and after a little hesitation on his part as to the feasibility of starting, in went a reef, up went the mainsail, then we broke out the hook, and started out of the breakwaters. It seemed that the wind was determined to give the Owner the haha for putting in that reef, for off the old white tower that was once a lighthouse the wind fell to a summer's zephyr. When by the breakwater, out went that reef, and then the wind obligingly freshened and a little summer squall was observed making up out of the southeast, but no reefs this time, and we bowled along, making our six knots by the log easily, and soon picked up Branford Beacon on the starboard hand, and Nigger Head red spar buoy on our port, and heading for the tower on Pot Island, following soundings and the chart, ran into what we considered a good harbor, inasmuch as there were some yachts and fishing boats anchored there. On inquiring, however, we found that the regular anchorage was about 300yds. more to the eastward, so we hailed a launch, which kindly towed us between Pot, Money and High islands. The Skipper loves blue water, but he was not slow to admit the beauty of these little verdure-clad islets. The sun dipping gradually in the west made a splendid background. It was a mingled picture of sea, land and sky which hardly seemed the work of nature so theatrically had she performed her task. No photograph could show the beauty of this miniature fairyland. We had dropped the hook and lay around the deck simply absorbing the beauty of the scene. The Skipper noticed the protection from wind and sea from almost any quarter. The Crew heaved the lead, made about four fathoms of water, and then we decided to go in swimming. The water was deliciously warm, and we worked up a ravenous appetite for supper. It was about this time that we formed the acquaintance of "Leo." In his peculiar drawl he inquired of nearly every yachtsman we knew, a great many we didn't know, and proved to be a living epitome of yachting and yachtsmen. He also informed us that he could furnish anything we wanted—ice, meats, etc.—and would take our mail to Stony Creek. We promptly decided that after supper we would go ashore and look his place over. After supper, which consisted of six courses, in honor of the occasion, we paid him a visit and drank some of his very good beer, ordered dinner for the next day, marveled at the scenery, and listened to Leo's reminiscences of yachtsmen, until from the afar we heard the tinkle of eight bells, and then it was we decided to turn in and explore the beauties—natural—of the Thimbles on the morrow.

July 31.—A dull gray morning, with rain clouds banked up thickly to the east'ard. Had breakfast, went ashore and hired a small catboat. After dinner at Leo's sailed over in cat to Sachem's Head, where we called in the yacht club there and were very nicely received. Beat back and got back at Leo's in the evening. Decide to start next morning for New London. The Skipper chafes at lying more than one day in port, and while the scenic beauty of the Thimbles is unsurpassed, the prospect of making Newport is enticing. Turn in at 12; sleep well.

Aug. 1.—Up early and get ship ready for trip to New London. Nice breeze from N.N.W. Stand well across Sound until Falkner's Island is abeam, then lay course for Cornfield Lightship. Pick up lightship at ten minutes past one. Breeze has freshened, and we will make New London easily by 4 o'clock. Carry away sister hooks of mainsheet block off Mantic. Wear ship, repair block. Time lost, twenty minutes. Lay course again for Bartlett's Reef Lightship. Pass it on port hand at 3:40. Stand in for New London. Tide very strong here. Innocent under good breeze smashes through them like a cork. She does not like these short, steep, broken seas as a rule, but we are logging fully seven and a half miles by the log, and they do not get much chance. To-day's run has been most glorious, a perfect sailing day, and as we pick the buoys up at the mouth of the harbor we wonder whether the god of fortune will attend us as well in our run to Newport to-morrow. We make the Harbor nicely and drop anchor in six fathoms of water at 4:20. After an early supper we go ashore, get shaved and send letters and telegrams home, explore New London a little. The Skipper generally wants to get out of a town as soon as he has walked through the main street. No exception. Try to get chart of Fisher's Island Sound, but found store closed. Return. Crew asleep as usual, and but for a friendly captain on a schooner whose name is forgotten, it would have been another long vigil. The Skipper hesitated about beating through Fisher's Island Sound without a chart, and to go on the outside through the Race would have made it too much of a run. The Owner and he agreed to sleep on it till the morning.

Aug. 2.—The Owner awake bright and early, tries to get Skipper up, but no go. The Skipper sleepily tells him to stick the flag in the rigging and get towed through, as there is hardly a breath of wind. At this point in getting ice, we are informed that we will have no trouble in getting through, as we have the tide in our favor, and the wind will spring up from the south'ard. We decide to cook breakfast under way, and have the sails on her in a jiffy and find we have just enough air to give us steerage way. We worked through gradually until we are past the Dumplings, when by Ram Island Lightship we are becalmed and have a hard job holding our own with the tide, which has turned. After two hours of this, in which we are entertained by a school, or rather schools, of



porpoises, we get a little breeze from the south'ard, and gradually pass the lightship. The breeze is now freshening, and we are commencing to log. We pass the lighthouse at Watch Hill, and then lay our easting. It may not have been wise to run down our lee shore the way we did, but we wanted to make Newport early, and the Skipper, giving the Innocent just enough offing to clear Point Judith, let her romp away. It was simply grand. Away on our starboard hand the distant shore of Block Island dimly stood out of the haze, while the white sand line of the Rhode Island shore seemed like a line of white fire. And as we tore along, smoking, with the Bartender splicing the main brace every once in a while, we agreed that old ocean in her kindly moods is unsurpassed. We passed Point Judith ten minutes of three. Passed Brenton Reef Lightship well on starboard hand at 4:30. It was, as I have said, a fine day, but how those swells did roll in from the Atlantic, big fellows, that would lift the Innocent up 8 or 10ft. and then—down hill again. We had been giving a large knockabout a great race of it from the point, and were holding our own nicely. We also picked up several cats, and under a breeze which was freshening, we simply tore by Butterball, and with jib sheets eased all we could and main boom out to the rigging, we tore into the harbor. The Skipper at once saw it was no time for monkeying. We had too much sail up for easy sailing, and the harbor was literally jammed with a flotilla of yachts of all kinds from the Lark to the Nourmahal. To the east in the Cove there was comparatively open space, and here the Skipper rounded to, doused jib and let go the hook, and with a smack and a bang got down the mainsail. Phew! it had been hot work for the last twenty minutes, but everything had held, and Newport, our Mecca, had been reached. We trimmed up ship and got supper quickly and were ashore in no time. After calling on some of the Owner's friends we turned in, in eager anticipation of the race to-morrow between Columbia and Independence.

Aug. ...—A mere record of laziness. With the exception of driving to Bateman's Point to witness the memorable race between the Columbia and the Independence, when the latter was beaten by 25 seconds, we made no journeys together, the Skipper preferring to loll about the deck and smoke a cigar, than "excursionizing," as he termed it. On Sunday we intended to go to Narragansett, but it rained, and we made no more attempts to travel in company, the Owner going to Providence, while the Skipper took a drive around the town. Newport is unique in one respect—the beauty of her drives and residences, and the narrowness and dinginess of her city streets, the negation of a modern township, a trillionaire's palace, a tradesman's shanty. While Newport is concededly the Mecca of the society grub, that fact is not oppressive, however. In Newport there are two classes—the intensely rich, and those who minister to their wants. From a yachting standpoint the harbor is perfection, and as that is the all-important question to the readers of this, we will not dwell on the social aspect.

We decided to start on Tuesday morning for Shelter Island, having loafed away three and a half days in Newport. The Skipper was getting impatient and the Crew lazier than ever, while the Owner was also sighing for fresh fields and harbors new. So, on Tuesday morning at 6, sail was made, and, with a favorable wind from the N. E., we gently ran out of the harbor. While the breeze was soft and favorable, it promised rain, and the Skipper got into his oilskins. Several yachts were standing out of the harbor, but, as usual, we more than

held our own, beating a magnificent black schooner out to the lightship. Here the wind grew puffy, and a long swell rolled in, which, to our surprise, just suited the Innocent. She made splendid weather in these big seas, and we rapidly left Point Judith astern. We lay our course to the outside of Fisher's Island, rapidly picking up Watch Hill Lighthouse on our port hand. The wind had freshened considerably, and we were tearing through the water, the log showing 8 miles. Off Race Rock Lighthouse the tide started to ebb, and meeting the fresh northeaster, we didn't do a thing; talk about tide rips; swirling about to port and starboard, each chop with a seemingly different destination, yet all carried along with a velocity of at least 4 knots, we had the wind nearly fair, blowing at least twenty miles, but it took us at least an hour and a half to draw away from the Race. It was here the wind seemed to increase, and it looked nasty and vicious all round. The Owner suggested reefing, but, with a lee short ahead of us, the Skipper hesitated; our true course for Shelter Island was now S. W., but the Owner said the best he could make was S. E., so perceiving a neck of land on our port bow, the Skipper decided to run behind it for shelter, drop anchor, reef and sail leisurely into Shelter Island. It was, we afterward found, blowing about twenty-five miles, and the seas were too big to think of heaving to; moreover, as we had but a short distance to run for shelter, the Skipper decided to keep her traveling. The Innocent, in spite of her large sail spread, was making good weather of it. She is a dry runner, and we hardly shipped a sea. The wildness of the surroundings, the absence of any sailing craft, the angry looking lee shore, the cannonading of the seas as the Innocent smashed and drove her chunky, powerful overhang through them—all this had evidently got on the Owner's nerves, and he informed the Skipper he would have the rig cut down as soon as we got back. The Crew, with supreme confidence in the Skipper's judgment, looked on with a smile, and the Skipper, he winked his eye. But the Skipper here began to be puzzled; we began picking up a number of yellow buoys; the Skipper surmised that they were private marks of some kind, and as they lay between black and red channel buoys, he thought it safe to run pretty close.

[TO BE CONCLUDED.]

YACHTING NEWS NOTES.

Members of the Red Bank Y. C. have commissioned Messrs. Herreshoff and Wells to design for them a one-design class. The boats will be of shallow draft and will be built under the supervision of the architects.

The catboat Win or Lose, owned by Mr. Charles A. Hatch, has been sold to Mr. Henry C. Southack.

The steam yacht Telka, owned by Mr. Gustav E. Kissel, has been sold through the agency of Messrs. Gardner & Cox to Mr. C. P. Rosemon.

Mr. L. R. Connett has sold his sloop Pickaninny to Mr. E. H. Low.

The steam yacht Speranza, in charge of Capt. M. Christofferson and three men, sank in the Raritan River on Sunday morning, Oct. 12, after burning to the water's edge. The boat was bound from Hoboken to Trenton, via the Raritan Canal. Capt. Christofferson anchored off Florida Grove to await morning and clear weather. The captain and crew were asleep, and were awakened by the smoke and flames. When the men reached the deck it was found that the fire was so far advanced that they had only time to save themselves. They took to one of the boats and lay to a short distance from the yacht for three hours, by that time she had burned to the water's edge and sunk. The men then rowed ashore. Speranza was designed and built by J. F. Mumm in Brooklyn in 1887. She was 100ft. over all, 78ft. 6in. waterline, 14ft. breadth and 6ft. draft. She was owned by Mr. O. S. Wilkinson, of Philadelphia, but was under charter to Mr. C. S. Mullen, of the same city.

Mr. Fred S. Nock, of West Mystic, Conn., has purchased the yard and railways formerly owned by George N. Saunders, of East Greenwich, R. I., where he will conduct a business of laying up and hauling boats for the winter and building new yachts. Mr. Nock has recently made the following sales: Schooner Viola, E. C. Baker, to W. W. Benson, Chicago; knockabout Arbeeka, Archibald McNeil, to J. B. Walker, New York city; yawl Anita, O. S. Anthony, to A. W. George, Mystic, Conn.; launch Blanche, to E. L. Nock, Providence.

Sir Thomas Lipton's third challenge for the America's Cup has been sent on the S. S. Oceanic, due in New York on Wednesday, Oct. 15. Com. Ledyard, of the New York Y. C., has ordered a special meeting of that club to be held on Thursday night to take action regarding the challenge.

Canoeing.

Cruising on the Delaware.

NEW YORK, Oct. 4.—*Editor Forest and Stream:* The "Delaware River Cruise," by Mr. Perry Frazer, appearing at a time when a party of us had just returned from the same waters, was of peculiar interest to us. I can picture the consternation of the natives along the river at the sight of the small canoe with the mother and child of a few months aboard. And while the residents ordinarily magnify the dangers of the river greatly, in this instance I feel their fears were not entirely groundless. As a matter of fact, there is no water along the Delaware between Hancock and Port Jervis—and this is considered the worst part of the river—that may not be safely run by any canoeist of ordinary experience. This statement applies to the Delaware at any reasonable level. In time of very high water nothing but a log raft has any business upon it.

As Mr. Frazer made the trip in almost a freshet, and as our cruise was, for the greater part, during a normal stage of water, when the conditions for canoeing and fishing are most favorable, I feel that a few observations may be of value to readers of FOREST AND STREAM. There were four of us, and Joe Bivins, the Narrowsburg guide, accompanied us and carried the duffle in a big skiff. We started in at Hancock Sept. 3 and brought up at Port Jervis Sept. 15. We drifted down to Lordville the first day. There was no bad water on this day's run, although it was necessary to wade a number of shallow drifts. The next day we made Hankins, ten miles below Lordville. There were several pretty stiff rifts along this water, one in particular, after leaving the ferry at Long Eddy. This is a long, swift stretch of water with a marked inclination and with numerous rocks. The channel is along the New York shore, turning sharply into the center of the stream at the foot of the rift and over a fall at the base of a small rock island. Mention should be made of Long Eddy as one of the best localities along the river for a fishing trip. The eddy itself and the rifts above and below it would afford a fine week's sport. Between Hankins and Callicoon—7 miles—there are some swift and rocky reaches, but nothing aside from shoals to cause trouble. What has been written of Long Eddy as a fishing spot may be repeated of Callicoon. It seemed wasteful to pass over such grand water without making more than a few casts. From Callicoon to Cochecton the warnings of the people became more numerous and urgent than before. Cochecton Falls are spoken of as the worst part of the river. This is hardly true. With the least care they are easily run. I have made the run three times and think less of it than of rifts and falls lower down the river. Mr. Frazer wrote of the natives having misinformed him when they directed him to hug the Pennsylvania shore. They were right, as this is the channel at any stage of the water. There are three drops here. The first is to be taken in the smooth water at the head of the falls, inclining closer to the Pennsylvania shore for the second fall and then out into the line of the breakers for the final pitch. We camped a day at the foot of the falls and fished with good success, securing both bass and pike. On Sept. 9 we dropped down over shallow rifts to Narrowsburg. After leaving the big eddy the rift below is to be run carefully. While there is not the least danger in it, it is very shoal, and being of some length, is apt to be a little hard to get through. The channel shifts from year to year. It was along the New York shore at the time we went through it. We camped that night at Hop Eddy, at the foot of this rift. It had rained heavily all day and that night the river rose a couple of feet and became very muddy. We had intended in leaving Hancock to make the Water Gap, but rather than pass over familiar waters without giving them a trial, we concluded to camp here until the water cleared, even though, by so doing, our cruise should be considerably shortened. Two days later we drifted down the river three miles to Rocky Rift. But the water still being muddy, we pitched camp here. The next day we resumed our trip with fair fishing. A mile below Rocky Rift Justin Bridge is sighted. After going over an old eel rack, which is usually too shallow for floating, but which was now covered a foot or more, we entered the Justin Rift. From here to Port Jervis is the worst part of the river, and this rift is particularly trying, being very swift and broken by numerous rocks. The channel runs somewhat obliquely from the New York toward the Pennsylvania shore, reaching for the line of the breakers when well out in the stream. From here, for a couple of miles, there is some quick and rocky water, but the rifts are short and easily managed. At Mast Hope Falls the channel is well toward the Pennsylvania side. Immediately below is Grassy Swamp Fall. In a low stage it is better to follow the line of the rough water; when the river is high one should keep on the right edge of it. After crossing an eddy Westcalong Rift is reached. This is long, swift and filled with rocks, but easily managed until the foot of it is approached. Here a bad reef requires crossing and the water is very swift. Keep pretty well toward the center of the stream and edge in toward the rough water at the foot of the rift, looking well ahead for the opening between the rocks. After crossing another eddy Wild Falls are heard. The highest breakers so far encountered will be found here. The way is straight ahead and clear, however, and the falls are easily run.

After paddling over a very long eddy the dam at Lackawaxen has to be crossed. In low water the boats will require to be led down over the dam close to the Pennsylvania side. At the time we arrived at the dam it was covered with a foot of water, and we went over it without difficulty. The water is pretty rough and becomes shallow at the foot of the rift. Some scraping of the bottoms of the boats will occur here. From this point to Pond Eddy there are several long, heavy rifts, but with a little ease they are safely made.

Below Pond Eddy, after going down over a number of fairly wild rifts and long eddies, we come to the point where the Mongaup River enters the Delaware. Just below the river contracts greatly and forms Mongaup Falls. This fall is not so long as that of Cochecton, but it is, in my opinion, the most formidable along the upper river. The breakers are extremely high and the rush of waters is calculated to "rattle" one somewhat. The Pennsylvania shore is to be hugged until the foot of the fall is reached, where a sharp turn into the line of the breakers is to be made to avoid a reef barely covered by water. Butler's Rift is the next place to be approached with caution. It will be known from its setting in along the old canal wall on the New York side and from its rough water. Keep on the right or Pennsylvania edge of the wild water and have a sharp lookout for rocks. By getting on the other side of the rift one would be swept against the canal wall with disastrous consequences. At the foot of this rift we observed the first rack along the river. The wings were not attached to it, so it was not in operation. But from this point to Port Jervis there were at least six other eel racks at work. The water was high enough to carry us over them without much scraping, however. From Butler's to the railroad bridge that crosses the river four miles out from Port Jervis, the Delaware runs through a deep eddy between high mountains. The scenery here and immediately below is the most beautiful along the upper river.

When the railroad bridge is sighted the roar of waters announces the approach of Saw Mill Rift. This is one of the spots most dreaded by the raftsman who runs down the Delaware in times of freshets, owing to the huge breakers and the setting of the current sharply against the base of the Pennsylvania mountains. The Pennsylvania shore is followed. The water was of sufficient depth and the rocks fairly far apart, and by keeping bow on to the breakers we experienced no difficulty in running through and on down to Port Jervis, the cruise ending here, owing to the cold nights.

The fishing was excellent until the river rose and became muddy. Even then after three days it was quite good. We caught plenty of bass and pike throughout the trip. Head winds and an eagerness to cover distance prevented careful fishing, but enough were caught to keep the river towns fairly well supplied with fresh fish. The bass averaged a fair size—about 1 pound. The largest caught was of 3½ pounds, and a pike of the same weight was landed. The bait used was chiefly salt pork rind on a white enameled spoon with single hook. We had frogs, catfish and lamprey eels, but preferred the pork. Some trolling was done, but casting was the method generally employed. The first day the bass rose well to the fly—Rube-Wood and royal-coachman—but thereafter fly-fishing brought poor results. I have never fished the Delaware earlier than September, and while I have used the fly faithfully and constantly during that month, the return has never been very encouraging. During July and August I believe it would be different. Below Lackawaxen still fishing is largely in vogue. This is rational, as the great depth of many of the eddies renders casting and surface trolling impracticable. With fair weather conditions the Delaware will yield better fishing next season than ever before in its history. Owing to high and roily water the past summer, not over 25 per cent. of the usual number of fish were caught. There is, therefore, a surplus of 75 per cent., in addition to the ordinary number left over for next season. These bass were seen by the hundred as we drifted down over the shallow rifts.

J. W. D.

Geological Survey Maps.

EXPERIENCE is a teacher who carries a good stout birch rod. A long time ago, in preparing for a canoeing trip on the Delaware River, I wrote to the Geological Survey Department at Washington, and inclosed payment for four sections of its maps of that part of the river it was intended to visit, hoping these excellent guides would aid me in locating various points of interest. A week elapsed, then a card came, saying maps of that portion of the river had not been published, but that other maps—of other portions—would be sent me. They were, and they arrived in five weeks, or one week after I had returned home. As maps they are superb, and no doubt accurate, but not one of them shows any part of the river visited by our party, while some of them deal with the backwoods sections of States not visited.

It seems to me this is a piece of gigantic stupidity. If I ask a shopkeeper for a rifle, and he says he has none, but will keep my money and send me a shotgun, would that be business-like, or the act of a sane man? Yet the Department stated that it could not return the money for the maps, but would send other maps. It did send them, but if they had dealt with the South Sea Islands, or some other equally distant land, they would at least have been interesting as curiosities, which these are not. The experience gained is worth the price, but the Department need not have waited all summer before informing me that it could not supply me. I would then have had time to purchase maps of some dealer in such useful things.

PERRY D. FRAZER.

Rifle Range and Gallery.

Iroquois Rifle Club.

PITTSBURG, Pa.—The fifteenth annual tournament of the Iroquois Rifle Club, of Pittsburg, Pa., was held Oct 6 to 9, inclusive. All shooting was off-hand at 75 feet distance, any .22cal. rim-fire being permitted. A Members' match was on the programme for the first day, each contestant firing 50 shots in five targets of 10 shots each on the twenty-five ¼in. ring target. The first prize, a gold medal, was won by L. P. Ittel, all other contestants receiving merchandise prizes. The shooting in this match was somewhat below the average. The scores follow:

L P Ittel	244	241	247	246	245—1223
R F Phillips	241	242	240	243	244—1210
C C Hofmeister	243	237	233	242	245—1200
O L Hertig	234	236	244	241	243—1198
W Riebling	236	241	243	235	238—1193
A J Huebner	239	235	238	237	237—1186
R Rahm	233	238	240	234	235—1180
A H Hofer	239	236	232	237	235—1179
H Sperling	233	233	228	239	231—1164
Geo Sperling	229	232	229	233	230—1153
J H Dimling	224	227	235	231	234—1151
J O Smith	228	231	227	233	229—1148
L J McCloskey	227	227	227	235	229—1145
J Kennard	236	217	227	227	221—1128
Geo Huebner	230	229	226	221	218—1124
H L Born	214	227	222	224	230—1117
U Altenburger	215	223	228	229	216—1111

The last three days of the tournament were devoted to the All-Comers' matches, with two events on the programme, the Continuous prize match and the Bullseye match. The conditions of the Continuous match were 3 shots per target, re-entries unlimited, the best 3 targets counting, ties being decided by the next best target. The twenty-five ring target, having ⅛in. rings, was used in this event. Thirty-four shooters took part in this match, and $100 in twenty cash prizes, ranging from $15 to $1, were distributed to the following contestants:

L P Ittel	75 74 74—223	H B Smith	71 70 67—208
R F Phillips	74 73 73—220	S W Hill	70 69 68—207
C C Hofmeister	73 72 72—217	J H Dimling	69 69 69—207
D L Black	74 71 70—215	W C Galbraith	70 70 67—207
A H Hofer	72 70 70—212	H R Fox	69 69 68—206
A J Huebner	71 70 70—211	W Riebling	71 67 66—204
R Rahm	71 71 69—211	A F Hofmeister	70 68 66—204
C C Freedman	73 73 65—211	P Paulsen	68 68 67—203
H B Pierce	71 70 69—210	H L Born	68 68 67—203
H Sperling	70 70 69—209	H Paulsen	68 67 67—202

In the Bullseye match the prize consisted of a handsome and

aluable silver tea service, and was won by C. C. Freedman. Each hooter fired 3 shots on a 4in. bullseye carton, the best single shot ounting. Thirty-two shooters took part in this contest, the following being the first twenty with the number of degrees each an's shot was away from the center: C. C. Freedman 9, J. Bergan 13½, H. B. Pierce 14, L. J. McCloskey 15, Geo. Sperling 18, I. L. Born 19, A. J. Huebner 22, U. Altenburger 22, R. Rahm 29, . O. Smith 29, K. W. Zoeller 31, S. W. Hill 31, M. Bedell 32, D. . Black 34½, A. H. Hofer 39, R. F. Phillips 39½, W. Riebling 48, . H. Dimling 53, C. C. Hofmeister 53, S. R. James 57.

This was the first tournament held in the club's new gallery ange at 1710 Jane street. A brief description of our new headquarters might interest the readers of FOREST AND STREAM. It is one-story with half basement brick building. The front is of lain but neat design. The shooting room, which is large and ommodious, is located in the basement. There are five shooting anges of 75ft. distance, each of which is equipped with a trolley or conveying the targets, a telescope for locating shots, and a leyns bullet receiver. The shooters face the targets through penings cut in a wood partition, on the interior side of which are rge smoke bells for carrying off the smoke from the rifles. Other onveniences add to the comfort of the shooters. On the upper loor is a large reception and meeting room. This contains the ockers for the rifles; also billiard and pool tables for the amusement of the members. In the rear of this is the refreshment room, here the wants of the inner man may be satisfied. The building as erected by the club a year ago, and we flatter ourselves on having a most excellently equipped indoor shooting range and club ouse. A cordial invitation is extended to all members of the rifle hooting fraternity who may have occasion to be in the Smoky ity at any time to pay us a visit, we can assure them of a hearty elcome.

C. C. HOFMEISTER, Sec'y.

Cincinnati Rifle Association.

THE annual prize shoot of the Cincinnati Rifle Association was eld on the 28th at Cincinnati, O., and was quite a success. There as a goodly atendance, and visiting riflemen from Lexington, Ky., and Richmond, Ind., were on hand to vie with the local lement for honors. A noticeable feature of the shoot was the umber of high scores made—more in evidence at this time than t any other. There were prizes for all, many of which were indly donated by the local merchants. The following is a list f the winners:

Off-hand, for the most points:			
ayne	1481	Roberts	1326
odge	1055		
Rest, for the most points:			
offman	907	Nestler	824
onscher	779		
Most flags:			
ayne	38	Nestler	48

On the regular prize targets the three best tickets counted for he first three prizes, the two best thereafter. All ties decided by he next best ticket.

Columbia Pistol and Rifle Club.

SAN FRANCISCO.—The Columbia Pistol and Rifle Club scores of Sept. 21, on Columbia target, 200yd. range, were as follows:

Rifle, 10 shots: Young 61, 61; Mannel 86.

Three-shot match: Ed Hovey 7, 15, 17, 23, 23, 24, 24, 25; Young 10, 10, 14; Mannel 12, 15, 16, 16, 17, 18, 22, 23, 23; Mrs. Mannel 29.

Military and repeating rifles Creedmoor count: H. Hinkel 43, 43; Korstman 42, 40, 39.

Pistol, 50yd. range: Brannagan 37, 48; Barley 38, 45, 51, 54; Young 38, 47, 50; Hinkel 48, 52, 55, 55; Mrs. Mannel 50, 58, 58, 65, 71, 79; R. Schneider 51; Twist 60, 80, 81; Hoffman 51, Allen 94.

Revolvers: Hinkel 40, 54; Brannagan 44, 46, 46, 51, 60.

.22 and .25cal. rifles: C. M. Daiss did best average work ever done here, with 16, 17, 18, 18, 19, 19, 21, 23, 23, 25; Pape 17, 19, 23; Kroeckel 18, 21, 22, 23; Twist 20, 24; Hoffman 24, 25, 26, 28; Hunsaker 34; Allen 40; Leach 58, 57, 73; Fuedner 25, 29, 29, 27, 31, 33, 36, 38; Magnin 73.

Oct. 5.—Two hundred yard range rifle match, 10 shots: Young 52, 55, 55, 57, 59; Hoffman 60; Cady 62; Mannel 14, 15, 17, 17, 22; Hoffman 15, 16, 21, 21.

Military and repeating rifles, Creedmoor count: Knostman 43, 42, 42, 41, 41, 40.

Pistol, 50yd. range: G. Barley 40, 52, 51; Young 48, 47; Brannagan 48, 52; Hunsaker 48, 53, 54, 55, 58, 65, 66; Twist 55, 59, 62, 61, 67; Mrs. Mannel 62, 63, 67, 74, 80, 85; Mannel 72, 69, 97; Gimmel 76, 82; Schneider 59, 60, 65, 69; L. Hinkel 54, 55; Knostman 91; Allen 90, 96; Mrs. Waltham 92.

Revolver: Brannagan 44, 46, 61.

.22 and .25cal. rifles: Daiss 19, 21, 22, 24, 27; Twist 21, 29; Hoffman 23, 26; Cady 26, 29; Mrs. Waltham 27, 30, 37; Hunsaker 32, 44, 45; Gimmel 37, 53; Leach 37, 39; Mrs. Leach 45, 45; Stevens 30, 42, 32; Allen 40; Magnin 72.

FRED. O. YOUNG, Sec'y.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Oct. 15.—Mt. Sterling, Ill.—Seventh annual target tournament of the Mt. Sterling Gun Club. J. Breidenbend, Sec'y.

Oct. 15.—Cleveland, O.—Fall tournament of the Cleveland Gun Club.

Oct. 15.—Charlotte, Mich.—Central Michigan Trapshooters' Association's fourth tournament. Hartel & Robinson, Mgrs.

Oct. 15-16.—Baltimore, Md.—Tenth annual fall tournament of the Baltimore Shooting Association; targets and live birds; $100 added money. Open to all. J. R. Malone, 2671 Pennsylvania avenue, Manager.

Oct. 15-16.—New London, Ia.—Sixth annual tournament of the New London Gun Club. Dr. C. E. Cook, Sec'y.

Oct. 15-16.—Springfield, O.—Springfield Gun Club's tournament. B. F. Downs, Capt.

Oct. 21-22.—Kenton, O.—Second annual fall tournament of the Kenton Gun Club; $75 or more added money. K. P. Johnson, Sec'y-Treas.

Oct. 21-22.—Sistersville, W. Va.—Sistersville Gun Club's target tournament. Ed. O. Bower, Sec'y.

Oct. 21-23.—Spirit Lake, Ia.—Klein & Burmeister's fall tournament.

Oct. 22-23.—Crawfordsville, Ind.—Crawfordsville Gun Club's tournament. M. Stillwell, Sec'y.

Oct. 24-26.—Bisbee, Ariz.—Tenth annual tournament of the Arizona State Sportsmen's Association. M. J. Cunningham, Sec'y.

Oct. 29-30.—Raleigh, N. C.—Two days' shoot of the Raleigh Gun Club; $100 added each day. R. T. Gowan, Sec'y.

Oct. 30-31.—Dalton, O.—Annual fall tournament of the Dalton Gun Club. Ernest F. Scott, Captain.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The programme of the tenth annual tournament of the Arizona Sportsmen's Association, Oct. 24-26, under the management of the Bisbee (Arizona) Gun Club, provides two days at targets and one, the third, at live birds. Beside the regular sweepstake events, there are various team, trophy and championship events, with liberal addition of moneys. Targets are thrown by a magautrap. Professionals may shoot along for targets or birds only. Medal winners must be residents of Arizona and members of Arizona gun clubs. Lunch will be served on the grounds free to participants. Targets, 3 cents; live birds, 25 cents. Banquet and business meeting, Oct. 26, at 3 P. M. Order all mail, telegrams, freight and express (prepaid) sent care of M. J. Cunningham, secretary. Excursion rates on railroads. Shooting commences at 8:30.

Mr. John S. Wright has arranged the programme of his live-bird shoot at the North Hudson Driving Park, New Jersey, Oct. 22, as follows: "Shooting commences at 10 A. M. prompt. No. 1, 7 birds, $5, 60 and 40, class shooting. No. 2, 10 birds, $7, 50, 30 and 20, class shooting. No. 3, 15 birds, $10, Rose system, ratio points 8, 5, 3 and 2. Birds included in all events at 25 cents each. All events handicaps, distances ranging from 26 to 32yds. Loaded shells for sale on the grounds. Take Hoboken ferries (Barclay, Christopher or Fourteenth street); or West Shore Railroad ferries (Franklin or West Forty-second street) to Weehawken, thence by North Hudson trolley direct to the park. John S. Wright, manager."

At the weekly shoot of the Crescent Gun Club there was a good attendance considering the distinctly unfavorable weather. The second win on the October cup was scored by Mr. Wm. J. McConville, with an even 50. Mr. C. J. McDermott was a close second with 48. Mr. H. M. Brigham was scratch and scored 43, which was high, apart from the handicaps. Later, in a trophy contest at 25 targets, he scored straight.

Mr. Chas. G. Blandford, captain of the Ossining (N. Y.) Gun Club, informs us that the Thanksgiving Day shoot to be held at Ossining, is not a tournament of the Westchester Trapshooters' Association, but is an inter-county seven-man team shoot, at 100 targets for cup emblematic of the championship of Westchester, Orange, Dutchess and Rockland counties. Visitors are welcome to "shoot along."

A two-man team race was a special feature of the Peters Gun Club tournament, at New Paris, O., Oct. 9. Each man shot at 50 targets. The teams finished with the following scores and in the following order: Heikes 46, Ideal 44; total 90. Fort 45, Kirby 43; total 88. Reid 40, Snakes 46; total 86.

We are informed that Mr. Geo. C. Lebohner, of Dexter Park, Brooklyn, had an attack of hemorrhage of the stomach last week, which for a time portended a very serious termination. The illness was temporarily beyond the control of his physicians. Later reports were in more hopeful terms.

A five-man team race, 20 targets per man, $10 entrance, made interesting competition at the Gillman, Ill., tournament, Oct. 7. There were three teams. Of these Piper City team was first with a score of 81 out of a possible 100; Gillman team was second with 77, and Askum team third with 75.

The weather about New York on Saturday of last week was unfavorable for trapshooting. It was a mild mixture of fog, rain, murky atmosphere and general sloppiness. This, combined with the coal strike, constituted a situation to evoke long smiles and pleasant thoughts.

The subscribers of the Interstate Association met at 99 Cedar street, New York on Tuesday of last week. They decided to abolish the Grand American Handicap at live birds. The target tournaments will be given on the lines as heretofore conducted.

Mr. George H. Piercy, of Jersey City, has challenged Mr. Neaf Apgar, of Plainfield, N. J., to contest for the target championship of New Jersey, now held by the latter. The contest will probably take place in the latter part of this month.

In the twenty-first contest of the Cincinnati Gun Club's cash series, Mr. R. Trimble was high with a score of 47 out of a possible 50, shooting from the 19yd. mark. There were twenty contestants, of whom ten shot 80 per cent. or better.

The next regular shoot of the Richmond Gun Club will be held on the club grounds, Silver Lake, Staten Island, on Oct. 18. A special event will be a 30-target handicap for a $5 gold piece, entrance 75 cents.

Mr. W. Fred Quimby, now of Western domicile, was a visitor in New York last week, where he received a hearty greeting from his many friends. He departed Westward-ho early this week.

Fulton Gun Club will hold its next shoot on Oct. 19, commencing at 1 o'clock. A silver match box will be an object of competition.

At the Nebraska City Gun Club's tournament, Oct. 8 and 9, Mr. S. A. Huntley won high average.

BERNARD WATERS.

Cincinnati Gun Club.

CINCINNATI, O., Oct. 11.—Dark and cloudy were the weather conditions at the twenty-first cash prize contest of the Cincinnati Gun Club, held to-day. Mr. R. Trimble made a score of 47 from the 19yd. mark, and was high man of the event. The names, handicaps by distance and scores follow: R. Trimble (19) 47, Coleman (19) 44, E. Trimble (17) 43, Barker (17) 43, Gambell (18) 42, Capt (16) 41, Faran (18) 40, Boyd (17) 40, F. Littleford (17) 40, Dreihs (17) 40, Randall (19) 39, Herman (16) 39, Ward (16) 38, Miles (16) 36, Maynard (18) 36, Van Ness (18) 35, Roll (18) 34, T. Littleford (16) 31, Corry (16) 27, Watterson (16) 21.

Hamilton Gun Club.

HAMILTON, Can., Oct. 7.—I beg to apologize for my neglect and delay in reporting the affairs of the Hamilton Gun Club.

The last regular shoot of the club was held on Sept. 13, and the club house closed until after the open shooting season is over.

The following are the complete scores in the Peters trophy race, which was shot off in sixteen strings of 25 targets each, the twelve best strings to count, shooting being done on sixteen different days. The total number of targets shot at in this race was 6,475.

The trophy was won by Chas. Briggar, score 249; first money going to Thos. Upton, score 248; second money to John Bouton, score 236. W. Wurk shot for targets only and broke 244, Dr. Hunt 234, Dr. Wilson 229, John Hunter 226, M. E. Fletcher 222, M. Reardon 221, Geo. Crawford 188.

After the competition of the Peters trophy race, the president and vice-president of the club chose up sides, all members present shooting. The teams shot out to a tie. The vice-president's team then invited the members of the president's team to supper. The invitation was immediately accepted, and all members present adjourned to the Jockey Club, where ample justice was done to the bountiful repast prepared.

During the evening President Upton presented Mr. Geo. Crawford with a handsome Gladstone traveling bag in recognition of his services as treasurer of the club.

In self-defense permit me to say that the above letter is copied from the minutes of the club meetings; but we just had a lovely time, with a pleasant evening's mutual admiration, various brands of hot air artistically ejected in the proper time and place, and perhaps a smile or two.

At the last business meeting of the club we decided to give to ourselves a game dinner after the close of the big game season. Only members of the club will be there, with the exception of a select few on special invitation.

Oct. 15 being opening day for moose, next week will find many of our men en route for the north country.

Kindly keep our thirteenth annual live-bird tournament, which is to be held on January next, before the public, for our absence afield does not necessitate any neglect of so prosperous an association.

BEN IT.

Interstate Association Meeting.

A SPECIAL meeting of the stockholders of the Interstate Association, held Oct. 7, in the offices of the Laflin & Rand Powder Co., 99 Cedar street, New York city.

Present: President J. A. H. Dressel, representing the U. M. C. Co. in the chair; John L. Lequin, representing the Hazard Powder Co.; E. S. Lentilhon, representing E. I. Dupont de Nemours & Co.; A. W. Higgins, representing Laflin & Rand Powder Co.; T. H. Keller, representing the Peters Cartridge Co.; Ed. Banks, American E. C. & Schultze Gunpowder Co., Ltd. Le Roy Shot and Lead Works, Remington Arms Co. and the Markle Lead Works were represented by proxy.

Mr. Chas. Tatham, of Tatham & Bros., was unable at the last moment to attend the meeting, but telephoned the wishes of his firm in regard to the Grand American Handicap at pigeons in 1903, and asked to be represented by proxy.

The W. R. A. Co., Parker Bros., Marlin Fire Arms Co., and Hunter Arms Co. were not represented, but a telegram from Mr. Irby Bennett, of the Winchester Repeating Arms Co., and letters from Parker Bros. and the Hunter Arms Co., in regard to their views on the subject matter of the meeting were read by the secretary.

The business before the meeting was as to whether a Grand American Handicap at pigeons should be held during the year 1903, a call having been issued for a special meeting of the stockholders, under instructions from the president.

It was the unanimous sentiment of the meeting that it would be advisable not to give a Grand American Handicap at pigeons in 1903.

The schedule of target tournaments for the coming season will be considered at the annual meeting of the Association, which will be held on the second Thursday in December next (Dec. 11).

Marion.

MARION, Ind., Oct. 8.—Following are scores made by Marion trapshooters on the 3d and 7th of this month. The shoot of the 3d was held in a downpour of rain, but on the 7th we had fine weather all day. Chambers won high average at both shoots.

Friday's scores, Oct. 3:

Events:	1	2	3	4	5	Total

A. A., Sec'y.

Raleigh Gun Club.

RALEIGH, N. C., Oct. 9.—Following is an account of our shoot to-day. The weather was perfect and a large number of ladies lent their charming presence to the occasion. They were interested spectators, and cheered when a difficult shot was made.

There was a goodly number of the members in the shoot at the beginning, but a few dropped out before the finish. The contest was close, and really in doubt until near the close.

Mr. James I. Johnson was the winner of the first prize, a handsome gold medal. He made 90 per cent., breaking 45 out of a possible 50. Mr. Johnson is, without a doubt, the best shot in the club, and his steady, superior shooting won the prize.

The second prize was won by Mr. R. T. Gowan. He tied with Messrs. J. C. Ellington and C. D. Arthur, making 43 targets out of a possible 50. The tie was decided in a 10-target event and won by Mr. Gowan.

The first prize is a handsome gold medal, and the second prize a beautiful trophy of the value of $5.

Mr. F. W. Parker shot well, making a score of 41 out of 50. James I. Johnson, Jr., also made a fine score—40 out of 50. He is quite a youthful member of the club, but shoots like a veteran, has a steady nerve and never flinches or hesitates, always firing in beautiful time.

The records made at 50 targets, distance handicap, were as follows: Jas. I. Johnson, Sr. (18) 45, R. T. Gowan (17) 43, J. C. Ellington (16) 43, C. D. Arthur (17) 43, F. W. Parker (17) 41, Jas. I. Johnson, Jr. (14) 40, G. N. Walters (16) 37, J. F. Ferrall (16) 37, R. P. Dixon (17) 35, T. S. Pearce (17) 36, R. Galloway (14) 36, P. Lee (17) 35, C. W. Barrett (14) 34, B. Stark (17) 33, J. S. Gray (17) 33, T. L. Eberhart (16) 33, E. C. Hillyer (16) 26, W. R. Crawford (16) 20, T. B. Crowder (16) 15.

Toronto Junction Gun Club.

TORONTO JUNCTION, Oct. 11.—The annual pigeon shoot was held on Thursday last, the 9th inst. The day was fine, with a good strong breeze, which made the birds go very fast, making the scores away below the average. Thirty-three members shot at 15 birds each, and J. Townson won first prize in Class A; C. Zeidler first in Class B, and J. Avann first in Class C. Following are the scores, American Association rules: J. Townson (28yds.) 14, J. MacLacklan (26) 14, C. Zeidler (28) 13, T. A. Duff (28) 12, J. Hardy (28) 12, G. W. McGill (30) 12, J. H. Thompson (30) 12, C. Kemp (30) 12, A. R. Stell (30) 12, W. Stevens (28) 12, H. Playter (28) 11, J. Avann (26) 11, P. Wakefield (30) 11, G. Mason (28) 11, H. Deye (30) 10, D. Blea (30) 10, C. Turp (28) 10, J. Paterson (26) 10, C. Reid (30) 10, G. Briggs (30) 9, W. Wakefield (28) 9, C. Herbert (26) 9, W. McDowall (30) 9, E. Morgan (28) 8, R. Harper (26) 7, C. Vint (26) 7, H. Haines (28) 7, D. C. Walton (30) 7, S. Richardson (28) 7, J. Giles (28) 6, A. Clayton (28) 6, D. J. Taylor (28) 5, A. M. Gabel (26) 4.

Nebraska City Gun Club.

NEBRASKA CITY, Neb., Oct. 8.—The fourth annual shoot given by the Nebraska City Gun Club was pulled off on Oct. 8 and 9. The weather has been as fine as could be desired. The attendance was not as large as was expected, but those present waded in and had a good time. Some good scores were made. Mr. S. A. Huntley, of Sioux City, Ia., was high man in the shoot.

First Day, Oct. 8.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

F. C. NICHOLSON, Manager.

Ligonier Tournament.

LIGONIER, Pa., Oct. 11.—The attendance on the second day of the Ligonier Gun Club tournament, Oct. 7 and 8, was light. On that day the Jack Rabbit system governed the division of the moneys, while on the first day the Rose system governed.

First Day, Oct. 7.

There were twelve events at 195. L. B. Fleming, of Pittsburg, was high man, making 169; Jenniker second with 168, and E. C. Ramsey, of Ligonier, third with 165. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Denniker	15	13	18	14	10	17	15	10	15	14	18	14

Gillman Tournament.

GILLMAN, Ill.—During the winter months there is usually more trapshooting throughout central Illinois than during the summer and the opening guns were fired at Gillman, Oct. 7.

A very short notice was given of a one-day's shoot, and only the surrounding towns turned out, with the exception of one representative from the Windy City. The neighboring towns of Piper City, Askum and Watseka were well represented.

A feature of the shoot was a team contest. This caused at least five men to come from Askum and Piper City, and this helped swell the entries for the day.

The writer has often had it brought to his notice that there is nothing that keeps up the interest in shooting as much as a team contest. Every town gets interested in their club, much more than as individuals.

The day was fine, and as the traps worked nicely, the shooting was much enjoyed by all, save possibly the men who made the lowest scores.

Piper City came to the front, both collectively and individually, as Mr. Harris was high man for the day.

Team shoot. Conditions, five men, entrance $10, 20 targets to the man, money 60 and 40 per cent.

Piper City team—Fortier 14, Harris 18, Ferris 17, Weels 16, Westerhouse 16; total 81.

Gillman team—Frisby 16, Heise 18, Peck 12, Reitz 19, Humphrey 12; total 77.

Askum team—Keene 15, Clark 17, Duckham 13, Myrick 16, Gordon 14; total 75.

The other scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13

BONUS.

Peters Gun Club Tournament.

NEW PARIS, O., Oct. 10.—The Peters Gun Club, of this place, gave their annual tournament yesterday at the shooting park east of town. The weather was all that could be expected, not even a breeze interfering.

The attendance in the forenoon was rather small, but during the afternoon the crowd began to gather until the grounds were literally covered with shooters and spectators.

The programme was not carried out, as it had been intended, on account of the small number of shooters to enter at the beginning, but all seemed to enjoy themselves, and expressed themselves as being glad that they came. The principal interest of the day centered on the trophy event—which was won in the shoot-off by Ed. French, of Richmond, Ind., and a special 50-bird team event between Heikes and Ideal, Fort and Kirby, and J. E. Reid and Snakes, the match being won by Heikes and Ideal with a total score of 90. The other two teams scored 88 and 86 respectively.

The next regular monthly shoot will be held on the same grounds on the second Saturday of November. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	15	15	15	15	15	15	15	10	25	50

G. L. LYNE, Sec'y.

ON LONG ISLAND.

Crescent Gun Club.

Bay Ridge, L. I., Oct. 11.—Notwithstanding the bad weather, foggy, rainy and uncomfortable, there was a good attendance at the weekly shoot of the Crescent Gun Club to-day. The scores follow:

October cup, 50 targets, handicap allowances added:

	—First 25—			—Second 25—			
	Al'ce.	Brk.	Tot'l.	Al'ce.	Brk.	Tot'l.	Total.
W J McConville	5	20	25	5	20	25	50
C J McDermott	6	20	25	6	17	23	48
Dr J J Keyes	2	20	22	2	21	23	45
H M Brigham	0	21	21	0	22	22	43
W W Marshall	6	19	25	6	7	13	38

Trophy, 15 targets, handicap allowances added. McConville, by virtue of his handicap, won the prize:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
McConville	3	11	14	Marshall	3	6	9
Keyes	1	12	13	McDermott	3	5	8
Brigham	0	12	12				

Trophy, 15 targets, handicap allowances added:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
Keyes	2	11	13	McConville	4	7	11
Brigham	0	13	13	Marshall	3	8	11

Shoot-off, 5 pairs, handicap allowances added:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
Keyes	1	7	8	Brigham	0	3	3

Shoot for trophy, 25 targets, handicap allowances added:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
Brigham	0	25	25	McDermott	5	18	23
Stake	6	17	23	Marshall	6	15	21

Sweepstake, 15 targets: Brigham 13, McDermott 10, Stake 8, Marshall 7.

Sweepstake, 25 targets: Kryn 24, Brigham 23, Pickett 18, Marshall 17.

Ossining Gun Club.

OSSINING, N. Y., Oct. 11.—Rain, rain, rain! Will it ever let up raining on Saturdays? Notices were sent out for a shoot for a silver-handled umbrella, presented to the club by our genial vice-president, Dr. E. B. Sherwood. But six contestants came out to win this appropriate trophy. The handicap was added birds, which seems to some to be more satisfactory than distance handicap. Mr. Dimmick shot at the traps for the first time to-day, considering which fact he did remarkably well. Coleman came down from Sullivan county at 2 o'clock with a nice string of game, but he couldn't stay away from the clay bird game, and came within one bird of landing the umbrella.

One-half cent was taken from the price of each bird to make up a sweep, two moneys. Coleman got first, Blandford second.

Several favorable answers have been received from clubs desiring to compete for the intercounty cup on Thanksgiving Day.

The results of to-day's handicap were as follows:

E J Ball	10111110111101011011111101—19	111110 —5—2
J C Barlow	11110011111101110011111100—18	010011 —3—2
W Dimmick	11010110000110010111110101—14	00101100—3—1

C. G. B.

Lodi Gun Club.

CLEVELAND, O., Oct. 11.—The subjoined clipping was taken from the Lodi Review of Lodi, O. JOHN MARREN.

The Lodi Gun Club had a shoot of more than usual interest last Friday afternoon. Two visitors, Geo. High and Herman Holmes, of Medina, were present and participated. Mr. Holmes is the general traveling passenger agent of the Louisville & Nashville Railroad. Two sets of 25 pigeons each were shot, Mr. Holmes demolishing the most clay birds, and Gariss was second. Messrs. Plank and Bert Harris were tie for third place:

	First 25.	Second 25.	Total.
Holmes	19	22	41
J W Harris	19	17	36
Bert Harris	18	19	37
High	11	16	27
Plank	17	20	37
Drysdale	3	3	6
Foyer	8	11	19
Collins	16	16	32
Gariss	19	19	38

Mr. Holmes sported a $400 Parker gun. It was a beauty, to be sure.

WESTERN TRAPS.

Laporte of Indiana.

CHICAGO, Ill., Oct. 11.—Laporte Gun Club, of Indiana, holds a target tournament Thursday, Oct. 16, equitable system, $5 to first and second programme guns.

Mount Sterling of Illinois.

Mt. Sterling Gun Club, of Illinois, holds its seventh annual target tournament Oct. 15; $10 to ten low programme guns, no one barred.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Nishoyne Gun Club.

Oct. 11.—The Nishoyne Gun Club, of Orange, N. J., held its weekly shoot, although the weather was foggy, dark and rainy. The Mountainside Gun Club, of West Orange, will shoot a match with the Nishoyne Club on Saturday of this week on the grounds of the latter. The scores:

Events:	1	2	3	4	5	6	7	8	9	10

Answers to Correspondents.

No notice taken of anonymous communications.

H. M. A., Boston.—Will you settle a question in dispute that is left to your decision. It is over the American game bird commonly known as partridge, and the bird more technically known as ruffed grouse. Are they one and the same bird, or are they two distinct types? I do not mean to use the term "partridge" as it may be used in any one locality, but as it is used generally throughout the United States and Canada. Is it correctly used to denote the ruffed grouse? Ans. There is no American bird commonly known as partridge throughout the United States. In New England and parts of Canada the ruffed grouse is commonly termed partridge, but in the mountains of the Southern States, and in Minnesota, the same bird is called pheasant. Neither term is correct, for the bird is a grouse. On the other hand the partridge of the Southern States is known in New York and New England as quail. It is not a true partridge, but is very near the true partridges, and belongs to the sub-family *Perdicinæ*. Thus two widely distinct gallinaceous game birds in America are locally called partridge. A Southerner, speaking of the partridge, would be talking of a type of bird distinct from that intended by a New Englander who spoke of a partridge. Of course the common English names of many American birds were given them by the early English settlers of this country, who named various birds robin, blackbird, partridge and so on, because the birds they saw here seemed to them to resemble the Old World birds called by these names. But the American partridge (quail) is different from the English partridge. The American robin (thrush) is different from the European robin redbreast, and the American blackbird (starling) is very different from the English blackbird (thrush).

PUBLISHERS' DEPARTMENT.

Some Good Advice.

In one of the leading magazines a distinguished physician advises that wool should be worn next to the skin the year around in our climate; light in summer, heavy in winter.

This is good advice; and if care is taken to see that the woolens are absolutely pure and porous, as in the well-known goods of Jaeger manufacture, one can be sure of comfort as well as health from acting upon it.

The Long Island shore has always been a great place for the building of boats and yachts, and it remains so to-day, even though ship and boat building yards dot the coast nowadays from the mouth of the Chesapeake to Casco Bay. Among the builders of auxiliary and cruising yachts are S. C. Wicks & Co., of Patchogue, N. Y., who can be communicated with by letter or telephone.

The South Bay Scooter is a modern vessel evolved in Great South Bay, Long Island, where it has proved itself useful to duck shooters and others. It may be defined as a sneakboat on runners, and is especially handy in shoal waters and in winter weather. Mr. Henry B. Watkins, of Bellport, L. I., is a specialist in the construction of these boats.

Winter is the time for yacht building, and those who are going into yachting, or are about to build new vessels, are looking around now for builders and designers. Mr. Thomas F. Muncy, of Bay Shore, L. I., can furnish designs, or will build from those furnished him, for the best trade only.

Mr. L. B. Fleming won high average for the two-days' competition of the Ligonier tournament, Oct. 7 and 8, making 88.6 per cent. He used Peters factory Ideal shells and Dupont powder.

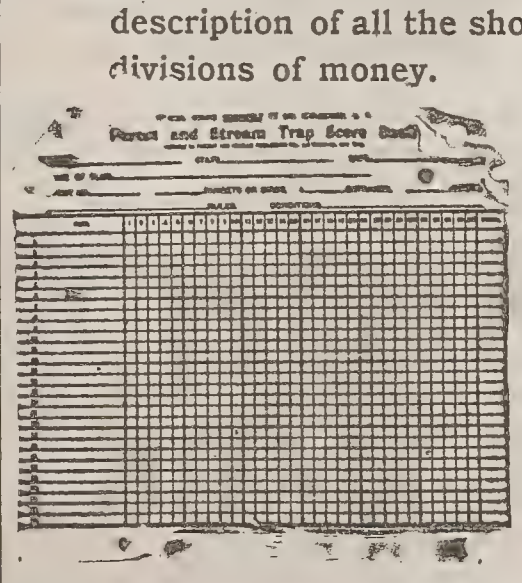
FOREST AND STREAM

Trap Score Book.

The only one containing the new (1902 revision) Shooting Rules of the Interstate Association, for targets and live birds; The American Shooting Association Rules; and the revised Hurlingham Rules. And a detailed description of all the shooting systems in practice for the divisions of money.



FOREST AND STREAM'S new Trap Score Book will admirably fill the needs of clubs and contestants in affording a means of keeping a faithfu record of contests. Each book contains a generous number of sheets, so ruled as to make all the chief divisions of the shoot plain at a glance. For instance, the horizontal spaces are numbered from 1 to 27, every sixth line being distinctly heavier than its fellows; hence the squads are distinguishable at a glance. The perpendicular spaces are numbered from 1 to 30, ample space first being left for the contestants' names and their handicap allowance. Heavy dark lines are between each five spaces, and the numerals 5, 10, 15, 20, 25 and 30 are in heavy-faced type, so that the number of targets or birds to be shot at are apparent at a glance. The heavy ruling also is an advantage in bad lights. However dark a nook the scorer may be in, no straining of the eyes or incorrect entering of scores is possible on account of inability to distinguish the lines of the score sheet. At the head are the usual spaces for current data. Each sheet is perforated, so that it can be readily torn out when manifold copies are made, and yet each sheet is strong enough to hold firmly in place if the book is desired for permanent club records. A neat pocket on the inside of the back cover holds carbon sheets for manifolding. The book is neatly and substantially bound in cloth, and contains 150 score sheets. The price is $1

FIELD GUNS.

When, 15 years ago, we introduced the light weight, short barrel 12 gauge **Featherweight Francotte Guns,** most hard practical field shooters who were lugging their 8 or 9 pound guns when following their bird-dogs, shook their heads and very much doubted that anything like the same bag could be made with these "grasshopper" or "mosquito" guns as with their heavy old-fashioned guns.

When, however, one of these full-choked little guns made highest percentage of pattern and penetration in gun trial where most of the leading guns competed and when others were winning highest honors at the trap—then, public opinion began to change. Since then thousands of our Francotte and Knockabout Guns have gone into the hands of leading sportsmen.

FRANCOTTE AND KNOCKABOUT GUNS have always kept well ahead of all competition as regards shape and model, strength coupled with light weight, shooting and wearing quality, fit and finish, and the ownership of either make of gun is a testimonial as to a sportsman's standing.

FRANCOTTE GUNS, all gauges, weights, length of barrels and shape of stocks from $80.00 to $450.00 net.

KNOCKABOUT GUNS, all gauges, weights, lenght of barrels and shape of stocks, $60.00 net.

We are willing to take your second-hand guns as part-payment for new ones.

MAUSER SPORTING RIFLES, $45.00 to $50.00.

MAUSER AUTOMATIC PISTOLS, $22.65 to $25.00.

THE "REGENT."

A WONDERFUL NEW ENGLISH HAMMERLESS.

Price, $65.00 net, worth double.

The cut does not do justice to the gun, but we can guarantee them to be made by the best gunmaker in England and bored on the same principle that has won world wide honors for English guns.

The barrels are best Siemans Martin steel, and the shooting is unexcelled. The stocks are selected English walnut, latest model Anson and Deeley action, top automatic safety, nicely engraved, and finish and workmanship throughout up to the best English standard.

English guns have long been the standard of the world, and this new product will mark a new era in price as well as quality.

We have never before been able to offer so fine and good a gun for so little money. They can be supplied in weights from 6¼ lbs. to 8 lbs., in 12 bores, and from full choke to true cylinder.

We carry a large line of guns and rifles from $6.00 to $600.00, and are sole U. S. Agents for the celebrated W. W. Greener.

26 Consecutive Bullseyes At 1,000 Yards.

A Record That Is A Record Made With

WINCHESTER CARTRIDGES.

At Plattsburg Barracks, N. Y., August 19th, Sergeant Leonard Deitz, Co. M, 23d U. S. Infantry, shooting Winchester .30 U. S. Army Cartridges in a U. S. Military Rifle equipped with open sights, made the unprecedented record of 26 consecutive bullseyes at 1,000 yards. In 10 preliminary shots his score was 0 4 5 3 5 5 5 5 5 5—42; and in his 20 shots for a record, he made 20 consecutive bullseyes. Sergeant Deitz's score is on record, being officially endorsed by Capt. Allaire, 23d U. S. Infantry, and he will receive a sharpshooter's certificate signed by Gen. McArthur. This is the first time in the history of rifle shooting that such a score has been made at 1,000 yards. Such phenomenal shooting is a conclusive demonstration of Sergeant Deitz's wonderful marksmanship, and also of the unerring accuracy of Winchester Cartridges. When buying Ammunition bear this in mind and ask for Winchester make.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

YACHT ARCHITECTURE.
By DIXON KEMP, Associate of the Institute of Naval Architects, and Member of Council. Second edition. Super-royal 8vo. Price, $16.80.
This work enters into the whole subject of the laws which govern the resistance of bodies moving in water, and the influence a wave form of body and wave lines have upon such resistance. It also deals comprehensively with the subject of steam propulsion as applied to yachts. An easy system for designing is provided, and every necessary calculation is explained in detail. The latter part of the work is devoted to yacht building, and engravings are given of every detail of construction and fitting, including laying-off, taking bevels, etc. The list of plates (exclusive of over thirty devoted to the elucidation of the text, and nearly 200 wood cuts) exceeds fifty, and comprises the lines of some of the most celebrated yachts afloat by the most successful builders and designers.
FOREST AND STREAM PUBLISHING COMPANY, NEW YORK.

Hints and Points for Sportsmen
Compiled by "Seneca." Cloth, illustrated, 224 pp. Price $1.50.
This compilation comprises six hundred and odd hints, helps kinks, wrinkles points and suggestions for the shooter, the fisherman, the dog owner, the yachtsman, the canoeist, the camper, the outer; in short, for the field sportsman in all the varied phases of his activity. The scope of the information it contains embraces a wild field, and "Hints and Points" has proved one of the most practically useful works of reference in the sportsman's library.

Builders of fine Pleasure and Hunting Boats, Canoes, Gasoline Launches, Small Sail Boats. Send stamps for Catalogue.

ROWLAND E. ROBINSON'S
Danvis Books.
These books have taken their place as classics in the literature of New England village and woods life. Mr. Robinson's characters are peculiar, quaint and lovable; one reads of them now with smiles and now with tears (and need not be ashamed to own to the tears). Mr. Robinson writes of nature with marvelous insight; his is the ready word, the phrase, to make a bit of landscape, a scene of outdoors, stand out clear and vivid, like a startling flashing out from reader's own memory.
FOREST AND STREAM PUB. CO.

TOWNSEND WILDFOWL PRINTS
1. "Where Would You Hold?"
2. "There With My First."
Two admirable ducking scenes by WILMOT TOWNSEND. Artotypes. Size of plate 10 x 15in., on paper 15 x 20.
Price, $3.00 each. Sent carefully packed.
FOREST AND STREAM PUB. CO.,
346 Broadway, New York.

Yacht and Boat Sailing.
By DIXON KEMP, Associate Institute of Naval Architects. Price $12.
This edition has been largely re-written, and contains a great number of new subjects, and the lines of many boats never before published, the total number of plates exceeding 100, besides more than 350 woodcuts in the text. Contents: "Selecting a Yacht," "Examination of the Yacht," "Building a Yacht," "Equipment of the Yacht," "Seamanship," "The Management of Open Boats," "The General Management of a Yacht," "The Rules of the Yacht Racing Association," "Yacht Racing; Handling a Yacht in a Match," "Centerboard Boats," "Centerboard Boats for Rowing and Sailing," "Sails for Centerboard Boats," "Small Centerboard Yachts," "Mersey Sailing Boats," "Clyde Sailing Boats," "Belfast Lough Boats," "Dublin Bay, Kingstown Boats," "Cork Harbor Boats," "Itchen Boats," "Falmouth Quay Punts," "Thames Bawley Boats," "Lake Windermere Yachts," "Yachts of the Norfolk Broads," "Small Yachts and Boats of Y. R. A. Rating," "Singlehanded Cruisers," "Types of Sailing Vessels," etc.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1902, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, OCTOBER 25, 1902.

VOL. LIX.—No. 17. No. 346 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

OCTOBER.

THE four great subdivisions of the year, spring, summer, autumn and winter, embody within them many other special seasons of the sportsmen's calendar, dear to the sportsman's heart. These seasons are as varied in length as they are in admirers, yet they afford opportunity, under nature's auspices, for the activities of the different sportsmen's guilds in the acceptance of nature's charming offerings. Though these seasons are charged with numerous and varied themes, men nevertheless find much of common interest in October days. And how?

First of all, it is a season when game restrictions are suspended.

He whose delight is to fish the spring brooks surcharged with babbling waters, or to fish the landlocked lakes newly stripped of their icy covering, has much of his favorite sport with rod and reel to which he may turn in October days.

Those who, on waters salt and fresh, set forth boldly and pleasurably in yacht and canoe for strange places or strange lands, have a delightful season in October days.

Those who camp on hill or in valley without the roar and rush of the great cities, have pictures of landscape from horizon to horizon in high coloring such as only October days afford.

Those who pursue the big game of the rugged and lonely wilderness, pitting their woodcraft against the cunning, endurance and physical prowess of their quarry, have for it the season of seasons in October days.

It is a season of superlatives, in which all the themes and sports of the other seasons converge and blend in matter of interest to all, whether they be devotees of the strictly useful or the universal beautiful.

To him whose chief delight is worshipping the beautiful of nature, October days afford pictures in unending variety, in all keys of beautiful coloring, and in size from little nooks to majestic breadths, delighting the eye and storing the mind with the pleasures of participation and of memory. All these charms are presented under opposing moods of nature in October days; sometimes under a canopy of dark cloud and boisterous winds; of raw wetness of earth and sky; betimes of an atmosphere, calm, cool and bright, softened with the light blue haze of the Indian summer, when the landscapes are the superlative delight of the artist.

The year, too, is closing up its labors preparatory to its winter months of rest. It has finished its fruition. The harvest time is at its highest culmination in October days, and they largely determine the dearth or abundance of the months till October recurs again.

To many kinds of the birds, October days are filled with warnings to depart for southern climes. The robins have broken up their domestic ways, and are leading vagrant lives for a while before taking their flights to the far south, where they are largely killed as a matter of sport or subject of food.

The ducks, geese, woodcock and snipe are beginning to drift toward a warmer clime in October days, and add a new interest to the season in the esteem of the sportsman.

The birds of local habits are at their best in October days, and in their honor they cause a general exodus of sportsmen from the towns and cities.

In October days, while in the pursuit of fin, fur and feather, men gain good health by exercise and fresh air; peace of mind by contemplation and pleasant occupation.

There is in October days a realization of many weeks' anticipation on the part of the sportsman; unlimited beauties in the sky, fields and woodlands to satisfy the poetical phase of man's nature; a harvest so bountiful as to please him whose delight is limited to the material productions of earth, and a game supply sufficient for the sport of the moment and to insure the sport of other October days if the game laws are observed properly both in letter and spirit.

SPRING SHOOTING.

WE print in our shooting columns a short note on spring shooting. It is a simple statement of the fact that the abolition of spring shooting in a district has been followed by the breeding of ducks there, a thing before unknown to men whose memories do not go back beyond the spring shooting era. This one single brief statement of the facts is worth long columns of speculation and argument. It is an unanswerable demonstration of the wisdom and profit of doing away once and for all with the shooting of wildfowl in the spring. What is good for one county in New York, is good for every other county in New York, and for every State.

Spring shooting may be opposed on sentimental grounds—the sentiment which abhors the taking of the lives of creatures which are on their way to the breeding grounds. But sentiment is an uncertain and fickle quality; experience has demonstrated in this particular field that sentiment cannot prevail against the passion for shooting. But the spring killing of fowl which are preparing to breed is also to be opposed for strictly economical considerations, and these may well have weight with those who on the sentimental side are the most stolid and indifferent. As an economic proposition capable of being stated in terms of spring nesting ducks, summer-hatched ducklings and fall birds for shooting, the protection of the wildfowl in spring should appeal to public intelligence. Spring protection of ducks pays; therefore, let us protect them.

LONG ISLAND WOODLANDS.

OUR recent remarks on forest destruction on Long Island aroused the city newspapers to the interest of this subject for their readers. Their local reporters and correspondents at once began to scurry about along the North Shore and South Shore interviewing coal and wood dealers, with the result that many columns of news were published concerning the information given by FOREST AND STREAM.

Along the North Shore, the cutting down of the woods has been going on very generally, and it seems as if every west-bound train on the road carried its carloads of wood. Some of this has evidently been cut for a long time, but much of it is newly cut and green. For some time past cordwood has been the equivalent of cash, and timber has been cut not merely for use at home as fuel, but to help out of his difficulties many a farmer whose crops have failed, or who, for any other reason, found himself in a position where cash was needed immediately.

Now that the coal strike appears to be over, the excessive cutting which has been taking place on Long Island will probably cease; for the price of wood will sink to its normal level and the inducement to destroy the timber will be gone.

MONEY.

A WEEK or two ago we made more or less complaint about persons who, sending to the FOREST AND STREAM sums of money for which they desire books or other goods, fail to give us the name and address to which these goods are to be sent.

We are obliged to bear the burden of blame for carelessness and failure to render value received from such persons, each of whom is, of course, unconscious that he omitted from his letter the most essential facts in connection with it. The unconsidered trifles continue to reach—and annoy—us, we are sorry to say.

In the United States there are a great many people, and among them an extraordinary number who are careless. The annual report of the Dead Letter Office last published shows that there were deposited in the post offices during the previous year in this country no less than 81,063 pieces of mail which bore no addresses. It shows also that of the letters and parcels received at the Dead Letter Office, more than 50,000 were found to contain money, to the amount of $48,000; and nearly 51,000 contained commercial papers of all kinds to the value of about $1,400,000.

These remarks are not addressed to those persons who have sent us money for which they have received nothing. Such persons are presumably out of reach. They are intended rather for those who may contemplate sending us money, each one of whom is requested to write plainly his name and address.

A notable enterprise in fish acclimatization has just been carried through successfully in Australia, where fish from the coast waters of Great Britain have been put out in New South Wales. The species selected for the experiment comprised plaice, soles, crabs, lobsters and some others; special effort being made to introduce the plaice, of which 722 were shipped, and the soles, of which the original number was eighty. The fish were placed in specially constructed tanks of immense size, which were connected with reservoirs of sea water kept constantly supplied fresh from the ocean by the ship's pumping apparatus. Of the lot of soles not less than 580 survived the voyage of more than 11,000 miles; and the other species fared well, except the lobsters, of which one solitary female was the survivor. When finally put out near Sydney Harbor, in August of this year, the fish were in excellent condition, and the Amateur Fishermen's Association, to whose initiative the transplanting was due, entertains every confidence that the assured result will be the enriching of these far southern waters with a new and permanent food fish supply.

The morning papers of Oct. 21 contained three press dispatches relating to the deaths of human beings at the hands of careless shooters. In one case it was a woman killed by a woman companion, and in another a man who was killed by a stray bullet from a long-range rifle. These two were of the class of fatalities which we are quite accustomed to hear of at this season of the year, and are of no special significance. The third, which means something, was the case of a Connecticut youth of seventeen years who had been tried on a charge of manslaughter for the killing of a hunting companion last August. The two shooters had been hunting on opposite sides of a hedge, when the defendant shot at what he thought was a bird and killed his companion. The defense was that the shooting was accidental and did not involve criminal negligence. The jury found for conviction.

The current millinery advertisements and the autumn show window displays in the shopping districts indicate that the bird as an appurtenance of hats and bonnets is still in the fashion. "The unusual demand for blackbirds has made them scarce in the market," advertises one firm. "We have secured fifty dozen of the most desired kinds, and will place them on sale to-morrow at 15c., 29c., 39c. 59c." "Black Amazon plumes of great value," announces another firm; "extra large birds," "black parrots," proclaims a third; and so it runs through the long catalogue of birds real and artificial. The autumn flight of bird-decorated headgear is on in full force, and there is still something for the Audubon Societies to do.

A correspondent asks for the origin of the fishing reel. The first mention of a reel in English angling literature is found in "Barker's Delight; or the Art of Angling," a little book published in 1651, which was two years before Walton's "Angler." In his chapter on salmon fishing, Barker speaks of a winder: "You must have your winder within two foot of the bottom to goe on your rod made in this manner with a spring, that you may put it as low as you please." Barker was also the first English writer to refer to a gaff for salmon anglers.

A convention of boards of trade and others interested in the establishment of the Appalachian National Park will be held at Asheville, N. C., to-day. The Park Bill which has already passed the Senate and been favorably reported by the House Committee on Agriculture, will come up early in the session, and confidence is felt that it will become a law in the coming session.

To every thing there is a season, and a time to every purpose under the heaven.—Ecclesiastes III:1.

Among the other things for an October day in the field,

The Sportsman Tourist.

A Trip to the High Sierras.—III.

(*Continued from page 314.*)

There was a little delay in starting the next morning, our cunning old horse had hidden himself so securely in an alder thicket that it took one hour's search to dislodge him, his feet, also, were in bad shape, and as one of the men in a party that came in the night before was a fairly good blacksmith, we had him reshod. The rain had ceased; everything seemed favorable, and we set off in high spirits for Farewell Gap. We reached the summit after a stiff climb, about 11 o'clock. The view from this point, looking north and south, is said to be the most extensive that can be seen from any trail in this section, and I do not remember of having seen it surpassed since I stood upon Mt. Hood in 1866. This range forms the divide between the Kaweah and the Little Kern rivers, the latter being one of the most famous trout streams in a region where they are exceptionally abundant everywhere.

Just over the divide was an immense snow drift, where the river has its origin, the trail running within a few yards of its edge, and only a few feet below began a meadow equal in beauty to any that we saw on the trip. On the upper end was about two acres that was an unbroken mass of blue lupins; next came an acre or more of Mariposa lilies, and then a vast kaleidoscope of purple daisies, columbines, shooting stars, etc., all in full bloom. Woodchucks and hummingbirds were plentiful, and here, for the firt and only time, we saw a strange looking black and white bird about the size and appearance of a magpie, but with longer legs and bill, flying about among the rocks.

Black clouds, riven by frequent flashes of lightning were rapidly rising in the west, as we descended the northern slope, and knowing that three miles down on the Kern there was a deserted cabin, we pushed on without delay with the hope of escaping the storm. These storms are quite common in the mountains here during the summer; they can be seen from, but never reach Visalia, and the heat there is more oppressive when they occur than at any other time.

The "Broder Cabin," toward which we were hastening, is a relic of the old Mineral King mining excitement, and was built by John Broder, one of the present proprietors of the camp at the giant forest, several years ago, and as there is no house within six miles of it in any direction, it has since furnished a welcome refuge to many a storm-beaten party of hunters and tourists. It was raining steadily as we drove up to it, and tumbled our pack into the open doorway, a building 15x30 feet in size, with neither door or window, but fortunately, with a tight roof. It was built of very large logs, and the roof was well braced to stand the weight of heavy snows. In one end was a tumble-down fireplace and in the other a bunk running the width of the building, with a smaller one at the side; a rough table of shakes was fastened to the wall, with a log on four legs for a bench in front of it; primitive enough, it is true, but it represented all that we required for the time being, and we thanked our stars for Broder's happy forethought. The cabin was located in a grove of tamarack, with a small stream, suitable for all household purposes, within ten yards of the door on one side, and on the other the Little Kern, full of trout, went brawling along forty feet below.

There was a good supply of firewood inside, left by some thoughtful predecessor, and we were soon engaged in drying our clothes and preparing dinner. The rain continued, with every prospect of a wet night, and the afternoon wore away until about 4 o'clock, when the tramp of horses outside aroused us, and we were surprised by the arrival of a party of five men and two women from Mineral King, en route for Kern Lake, twenty-five miles distant. They were orange growers from Lemon Cove, who had improved the interval between the irrigating and harvest season by a trip up to the snowy range. All were experienced mountain travelers, and their outfit left but little to be desired. Beside their riding animals, they had five fine pack mules, a wall tent, canned fruits and vegetables, honey, etc., three rifles and as many split-bamboo fly-rods.

The interior of Broder's cabin, with its blazing fire and dry couches, presented such a contrast to the muddy trails and dripping trees outside that they determined to go no further that night, but it did not prevent two, of the most enthusiastic fishermen of the party from jointing their rods as soon as the ladies had been attended to and descending to the river, from which they returned two hours later soaked to the skin, but bringing over fifty trout, enough for the whole party. In the evening we all gathered about the great stone fireplace, and while the women mixed bread and arranged the table, decorating it with flowers in tomato cans, the men fried flapjacks and trout, smoked their pipes and told stories of former experiences in the mountains. They had hunted for deer without success at Bear Paw and Mineral King, and were now headed for Kern River, where report said they were more plentiful.

The steady patter of the rain upon the shake-covered roof enhanced the cosy appearance of the interior, which the deft fingers of the women soon gave quite a homelike appearance. During the afternoon a lull in the storm had occurred that the men took advantage of to pitch the tent near the cabin, and a portion of the latter was partitioned off with tent cloth to make an apartment for the ladies that night. By 10 o'clock most of the party were asleep, only to be aroused a little later by the clatter of wood rats among the dishes on the table. Knowing the thievish propensities of these mischievous little rodents, the women hastily arose and secured all the spoons and cutlery, after which we knew nothing more until a vigorous yell from those in the tent outside announced the dawn of another day.

Breakfast having been partially prepared the night before, the men sallied out at once after the horses, and soon after sunrise, with every prospect of a fine day before them, our friends took their departure, leaving D. and I again the sole occupants of the Broder cabin.

We had intended going from the little Kern to Kern Lake, twenty-five miles further on, but the trail, which was very steep and rocky, had been rendered still more difficult by the recent rains; the time allotted for our vacation had also nearly expired, and we reluctantly decided to spend another night where we were, and return to Mineral King. It was with much regret that we reached this decision. Kern is many times larger than Eagle Lake, and abounds in bigger trout, that take both fly and spoon readily, and I had anticipated much pleasure from our visit there. Perhaps this regret would have been even more poignant than it was had these been the only considerations, but I confess that I missed the elasticity of limb that nearly forty years ago had carried me so easily to the crest of those mighty bulwarks that gird the glories of Yosemite, and realized that the long intervening years of sedentary life but poorly fitted me for a task that many a younger man would shrink from attempting on foot.

Little Kern River is nearly as famous for rattlesnakes as it is for trout, a reptile that D. was very anxious to meet in its native wilds. Since we had entered the mountains we had seen scores of places where they had crossed the road; they had been killed in front and behind us, and we had even heard the shots that destroyed them, but not a live snake had we seen. Some of the ladies of the Sierra Club wore skins about their hats, whose original wearers had been destroyed by their own fair hands, and we were assured that they were so numerous on the Little Kern that it was unsafe to fish there. All of which had made D. more anxious than ever to reach it.

Accordingly he and I a little later in the forenoon started down the river on an exploring expedition. Hunting rattlesnakes not being so much of a novelty to the writer, I took the rod and flies along as a fairly good substitute, especially as the appetites of our departed friends had not left a very large supply of trout on hand, and while D. was searching the adjacent rocks I whipped the pools for our dinner. The rain of the previous night had doubled their volume and changed them to a milky hue, making the fishing much poorer than is usual in this prolific stream; but there was not much difficulty in getting enough for our modest requirements. Not so, however, with the quest of D.; there was a serious deficiency in the visible supply of snakes, and the most careful search failed to bring a single rattler in sight. Perhaps it was the still dripping vegetation that kept the elusive ophidians so persistently under cover; but I shall always believe it was simply "kismet." Frank's two most ardent desires when we left Visalia were to kill a deer and capture a rattlesnake, and these were the only two possibilities of the trip that failed to materialize.

Near the river, about a mile below the cabin, we found a soda spring, whose waters were so deliciously pungent that it only needed a little syrup to furnish a beverage equal to any city fountain. About noon dark clouds again began rolling up from the west, and although we hastened our return, we were caught in a shower before reaching the cabin. A wet afternoon followed, during which two of the surveying party at Mineral King arrived dripping like drowned rats. They had been caught by the storm when crossing the summit at the gap. Hailstones the size of hens' eggs drove their horses distracted, and they had been obliged to seek shelter under their canvas pack cover to save themselves from injury. We were pleased to be able to return, through them, the kindness of Capt. Barnard, and while they dried their clothes at the fire, we warmed their stomachs with internal stimulants.

The surveyors did not pass the night with us, but departed for Big Kern River during a lull in the storm. There were no other arrivals during our stay at the cabin, which D. and I occupied alone that night.

The next morning dawned bright and beautiful, and we took advantage of it to return to Mineral King. Our stay there was for one night only, and the next morning we started on our long trek down the mountain by the stage road to Visalia. About a mile below the cañon contracts to a width of perhaps fifty yards, with abrupt walls on either side. Here a fence with a carriage gateway had been thrown across to prevent the egress of stock, making an excellent and fairly secure pasture of all the meadows between it and the summit of Farewell Gap. Two miles below this brought us again within the park limits, where we found a detachment of the cavalry guard encamped. Sequoias were quite numerous here, but not as large as those in the vicinity of Sierra Camp. The park at this point is about eleven miles wide and six miles below the encampment. In the very center of the park we found a large saw mill in operation, working those magnificent trees into lumber. There are, we understood, 360 acres here belonging to private parties; but the devastation being wrought is sad to contemplate, and it would seem advisable for the Government to purchase it and remove this cancer spot from this fair domain. Two or three miles below this were the ruins of another saw mill, that had been destroyed by a snow-slide. Nothing had been removed, and the ground was strewn with wrecked machinery. Mountain quail, the last we were to see, were very plenty and almost as tame as chickens.

In the afternoon we reached Grunegan's Ranch, a home station for the stages, eighteen miles from and 3,000 feet below Mineral King. Meals and stock feed could be had at reasonable rates, and there we met a few summer boarders to whom the extreme heat of the valley and the altitude of Mineral King were equally objectionable. The place was just outside the park limit, and although in the cañon, gave evidence of thrift and industry. The house was quite large, with a fine veranda that had a magnificent westerly view on the slope. Above it were many trees laden with fruit, and below was the barn and stockyards. Almost every rod of the road to this point had been a steep down-grade. We spent the night in the barn, and after a good breakfast the next morning, continued on down the cañon. Valley quail and doves now began to appear, and seven miles below we came to the power house that furnishes Visalia with 2,000 electrical horse power for its street railroads, flour mills, etc. The flume starts near Grunegan's, and in seven miles they secure a fall of 1,300 feet. The works were a model of their kind, and did credit to both builders and manager. Five miles further down brought us to Britton Bros.' store, our next stopping place, and less than a mile from Three Rivers, mentioned in the first number. Here D. and I passed our last night out of doors, rolled in our blankets beneath a tree in the great corral.

This is one of the finest places in the mountains. The cañon expands into a small valley, with pastures and meadows, fruit trees and gardens, and seems to be as well adapted to citrus culture as Lemon Cove. The store was well stocked with every variety of merchandise, and close by was a large shop owned by the firm, run by a turbine and supplied with laths, planers, circular saws, drilling and boring machines, capable of repairing any machinery in use in that section.

Learning that there was a daily stage from Three Rivers, we sold our outfit and engaged passage in it to Visalia. The return trip was by the same route over which we had so wearily plodded on foot in the intense heat on our way up, only instead of taking two days, it was less than five hours from the time that we started until the stage drew up before the Palace Hotel in Visalia. Here we had the pleasure of meeting Mr. John Broder, the builder of the famous Broder cabin, that had been to us and many others such a welcome refuge on the Little Kern. It is not likely that Mr. Broder had the public welfare in view when he erected that cabin, but as he took us by the hand that evening in the hotel with the memory of the two days and night spent there so vividly before us, it was impossible for us to regard him otherwise than a public benefactor of the highest order. He had just come in from Sierra Camp, of which he was one of the proprietors, and we were glad to have an opportunity to return the many kindnesses he had shown us while we were staying there.

The return to Visalia practically ended our trip, but it is with a lingering regret that I lay down a pen whose services have, again brought before me each salient incident of the most pleasurable outing I have enjoyed in many years. Good fortune attended us in most things from the start. The moral standard of Visalia is not considered by many to be as high as that of some of the sample towns on the coast. There is more than an average number of saloons to the square rod, and in years gone by, it has been the headquarters of several distinct gangs of train robbers; but during our stay there we were treated with marked kindness, and the outfit we purchased at the general store of L. N. Woods was first-class in every respect. No doubt much of this was due to our introduction by Mr. Huntley, who stands as high there as does Gokey of Dawson; but we found it the same with the park guards, and also at Sierra Camp and Mineral King. The meeting with Muir, Merriam, Hittell and Keith; the glorious evenings at Alta Meadows and Eagle Lake; the fine fishing; the grand scenery—all these are things we can live over and over again, as time rolls away.

One other factor in this connection I must mention, the last and best of all, coming like the dessert, the walnuts and the wine at the end of a feast—the companionship of one whose tastes and impulses were perfectly in harmony with my own; one whose love for nature in its wildest and grandest forms, and whose delight in probing the mysteries that surround the lives of the shy denizens of flood and forest, I have never seen surpassed; the friend of my early youth, who, although separated by years piled upon years and thousands of miles that intervened, never failed to welcome my rare returns to the town of my birth with an affection surpassing that of a brother; the one, in short, whom I would have chosen above all others for a companion. His presence alone would have made a desert blossom as a garden of roses. The locks of both are now thickly sprinkled with gray, our steps have lost the elastic spring of youth, and our eyes do not catch the sights of a rifle as quickly as formerly, but the lapse of time has only more firmly cemented the friendship of early manhood, and to have him with me as I did, formed a fitting climax to what is quite possibly the last extensive outing that will ever fall to the lot of old

FORKED DEER.

A Pretty Side Trip.

FEW of the transcontinental passengers over the C. P. R. know what an attractive side trip can be made by steamer from Rat Portage, Ontario, to Harding, Minnesota, a distance of about 240 miles. I had not looked for fine steel steamers luxuriously furnished on Lake-of-the-Woods, for I had just the geography idea of that locality, and I did not know that there were 14,000 surveyed islands in Lake-of-the-Woods, and that it was the most beautiful island scenery that one can imagine. The Rainy Lake steamers that make part of the side trip are not luxurious, and one realizes that he is on the frontier. There was evidence of that all along. In the lumber regions, for instance, about every man who was not at work was drunk. Good fellows, all right, but drunk, nevertheless. On the United States side of the boundary there is no license, for the country is not organized, and there is no one to whom liquor license is to be paid. The result is that any one can start any sort of a dive that he chooses, and be responsible to nobody. I wondered how one of the little steamers could earn sufficient income to pay running expenses, but learned that it was easy if one only knew how. The captain apologized for giving us "nothing but moose and ducks for meat," because, he said, that beef was pretty high. We stopped to get several cords of wood for the boiler, and I was informed that Uncle Sam owned the wood. The moose and ducks are shot by the steward. It is a part of his irksome duty. Now I can run a steamer for myself if some one will furnish provisions for the passengers, and if fuel is free. The only thing that would bother me would be the first cost of the steamer, but I am sure that there must be some way to get around that, too, if one is only trained to it. While we were in the Rainy Lake region—about three weeks altogether—we only had four days without rain. I remarked to one of my guides that the lakes were well named, and he patriotically assured me that it did not often rain there and that they were named after a man by the name of Rainy who discovered them. This guide was a character. I secured him by writing to the

ostmaster of a certain town, who informed me that e guide was a Christian gentleman who did not drink swear. Next time I will ask for Harry Tracy. It the first time in thirty years of camping that I have n across a lazy and indifferent man for head guide. e was unmarried, and I asked him one day how it ppened that he had never secured a partner of his sor- ws and a spoiler of his joys. He said: "Well, the ouble is the women in this part of the country won't no work. They won't jine hands with a chap and ke chances on luck. If a woman's a sport she says don't need to work,' and if she's a lady she says ll be damned if I work, anyhow.'"

It is a great moose country where we were, and the dians confirmed my guide's statement that no white nters ever went into a part of the country where we ent the latter part of August. I found the remains of recently killed moose in the first six miles of one the rivers that we went down. Three bulls in the lvet, and the rest cows and calves. Killed by the dians. There are so many moose there that it makes difference, however. In the town of Rat Portage ere is a by-law which states that "no moose, cattle, rses, geese or other animals shall be allowed to run large." It seems that the boys liked to have tame ose, and the moose took too many liberties. Rat rtage is a mighty fine town, nevertheless, and one at is well worth visiting.

Labor is scarce out in that country, and one sees signs calling for common laborers at $2 per day and board, d farm hands at $2.50 a day and board. I have a ggestion to make to the Canadian authorities, and ey can send me a box of cigars for the idea. In ewfoundland there are fifty thousand of the sturdiest rt of men who are out of work at just the time that en are most needed in the harvest fields. They will rk sixteen hours a day without grumbling. I know for I have employed lots of them, and at a dollar day at that. Now, if the C. P. R. can manage to t these 50,000 Newfoundlanders on the wheat fields at moderate cost for transportation every year, some- dy will be glad.

ROBERT T. MORRIS.

Natural History.

Notes on Monkeys.

How many of the readers of FOREST AND STREAM ever v a monkey which was but a few days old? I well member my surprise at the appearance of the first one ich was born under my care. It was a macaque mon- y (*Macacus cynomoldus*), and for a few days after its th, I imagined that it was a weakling, and would live a short time. It seemed as if it were preternaturally d, instead of being a few hours old; but not many ys elapsed before its appearance changed, and it became hubby-cheeked youngster, closely cl nging to its mother all her movements. Until it was about a week old, the n generally sat in one of the back corners of the cage sely holding the suckling in her arms, but in com- ratively a short time she climbed and sprang about, ily carrying her baby, which energetically clung under- th her, with its limbs around her body. S nce then I ve had several born while under my charge, and always s successful in rearing them.

I once had a female of the same species confined in a ge with several others of different kinds, all of which bullied most outrageously. Singular to relate, the only e that her chicken-hearted fellow prisoners summoned courage to pay her off for her domineer ng, was when became thoroughly intoxicated. During cold weather was my custom, on about two nights in each week, to e my monkeys a good drink of warmed ale, well eetened with molasses. So soon as the pan containing tipple was placed in the cage, the bully took posses- n of it, and no other occupant dare approach it until had guzzled her fill. She would then ret re to a cor- of the cage and allow her companions to drink the mainder. In a few minutes she would be thoroughly oxicated, and, strange to relate, all of her ill humor nished and she would allow her associates to play all ts of pranks with her, while she endeavored to hug and dle every one on which she could place her paws. The xt morning she would generally be found sitting in a k corner of the cage, and woe betide any of her fellow soners who dared to approach her.

I once had a pet Rhesus monkey (*Macacus rhesus*) t I kept n my room, which was always at liberty dur- my presence. Nothing delighted her so much as to ve me stretch out on the bed and allow her to make a rough search of my pockets for bits of candy which d been inserted for her special gratification. After the est was ended, she would give my hair and beard a mplete overhauling and carefully remove every bit of ndruff, etc. On these occasions she would not allow y one to enter the room. If my roommate wished ad- ittance, he was forced to knock and inquire "If that in- nal monkey was loose?" One afternoon I unhooked a all mirror which hung on the wall and held it in front her. On seeing her reflection, she grimaced and placed r paw on the glass, as if she wished to catch hold of the uble. Finding that she could not succeed she reached ound behind the glass with exactly the same result, when e receded and then bounded forward, attempting to ze her double with both paws. My sudden withdrawal the glass prevented its being smashed, and on its being in presented, with the back toward her, she failed to ognize it as the same object which had caused her so ch concern. Leaving it in the same position, I re- ved it, when [illegible] an a search, and after at least minutes passed in her fruitless quest, she gave vent her disappointment by a series of deep grunts, coiled alongside my body and fell asleep. The next day the rror was again presented to her, when she grimaced and ned her posterior to it. Having repeatedly seen this ion in other monkeys, I divined her wish, and gently atched her rump with one hand while the other re- ved the glass. So soon as the rubbing ceased she turned softly in quest of her double, and failing to behold it, seemed to be stricken with intense fear, and bolted underneath the bed, uttering a series of agonizing grunts. It required great care and a deal of tact on my part to keep from be ng bitten while endeavoring to remove her from her hiding place. I was finally successful by enveloping her completely in a portion of the bed clothes. One of the windows of my room opened on the yard of an adjacent building, in which several children of both sexes were accustomed to play. So soon as she heard their voices the monkey would seat herself on the window sill and seem much interested in their frolics. The boys would tease her by making use of all sorts of belligerent actions, to which she would respond by extending her ears and gaping repeatedly, which were indications of anger. The girls acted differently, making various merry, winsome actions, which caused the monkey to draw up the skin of her forehead, pucker her lips and grin.

One of the most difficult jobs that I ever had on my hands was the administration of the different remedies to monkeys, for the various ailments to which they are subject while in confinement. I always endeavored to use stratagem, instead of force, on such occasions, and I well remember a predicament in which I found myself once with a mandrill. He was confined in quite a large cage with a number of Rhesus monkeys, over whom he domineered to his heart's content. He was a great favorite with his keeper, who constantly overfed him, in spite of my frequent mandates to the contrary. Just as I feared, he was found one morning lying in a stupid condition, and diagnosing his case, I instantly began to plan how I should administer a dose of May apple (podophyllin). I hurried the keeper off to the apothecary with a note describing my need; he soon returned with a pill containing the required medicine. My next embarrassment was how to administer it without using force; as I did not wish to irritate the animal while in such a serious condition. Therefore, I concluded to use stratagem. Enveloping the pill in a bit of banana, I moved away a few feet from him and began to feed his fellow prisoners with bits of the fruit which I dropped along in front of them, gradually tempting them to approach him. When they arrived close to him I dropped the medicated morsel within his reach, when he slowly reached out, grabbed and swallowed it. Feeling much pleased at the success of my maneuver, I withdrew and anxiously waited until the next morning, when I found that the medicine had acted just as I wished, and the animal much improved.

During my sojourn in Durban, Natal, South Africa, my residence was in the suburbs of the town, at the foot of what was known as the Berea Hill. Immediately back of my house was a large sweet potato patch, the product of which served as one of the main sources of nutriment for my Kaffirs. From the rear of the patch the hill rose, densely covered with a forest growth, which was the hiding place of a host of Vervet monkeys, who subsisted largely on the plunder of the patch. Of course, the monkeys were the detestation of the Kaffirs, who used every means in their power to prevent the pillage, but were unsuccessful, as, whenever a foray was made, a sentinel was always placed in some safe, elevated position whence he could give the alarm whenever the natives started into the patch, thus giving the robbers notice to hurry off helter skelter, taking advantage of the ample growth of the vines for concealing their movements. One afternoon I happened to be arranging the sights of my Winchester rifle, when I caught a glimpse, through an open window, of a monkey climbing a corn stalk alongside the patch. Quickly raising the weapon to my shoulder I fired, and the bullet cut the stalk just below the watchman, causing him to fall with a heavy thud and a prolonged grunt, which served as a warning to the depredators, who retreated post-haste. The next day I secreted myself in one of a row of empty shipping cages, but not a monkey put in an appearance, and I underwent a like experience for several days.

It then struck me that my movements had been watched from some secure hiding place, and I determined to use an artifice in order to circumvent the depredators. Consequently, the next afternoon, taking my two keepers for company, we passed along in the rear of the cages, and when the one was reached in which the rifle had been placed on the preceding night, I hurriedly ensconsed myself, while the keepers sauntered on to the end of the row and back into the house. But a short time elapsed before I was gratified by the sight of a sentinel in a neighboring tree, while the vibrations of the potato vines betrayed the movements of the robbers. At the crack of the rifle the sentry tumbled from his perch, and there was a scramble for safety by the thieves. This artifice served for several days, when the depredators evidently fathomed my stratagem and ceased their pilfering.

There was an interval of several weeks, and the robbing was renewed, when I was forced to adopt a new device to circumvent the spoilers. Carefully concealing a shotgun, well up the hill during the night, I waited until the next afternoon for the customary appearance of the sentinel. So soon as I had located him, I sauntered off at a right angle until I was hidden by the foliage, when I turned and carefully ascended the hill until its summit was nearly reached, when I again turned and finally brought up in the rear of the gang, with my gun ready for use. Carefully descending the hill, I came within shot of the watchman without his being aware of my approach. He was riddled with shot before he could give an alarm, and a fresh cartridge was inserted before the panic-stricken gang came close to me, when two more were toppled over, and henceforth my neighborhood was rid of sweet potato thieves. In my wanderings about the neighborhood I found that it was necessary to keep small parties of Kaffir children constantly patrolling the mealie* fields to prevent a shortage of the crop.

One would scarcely imagine that a monkey could be trapped, but I had a number brought to me by Kaffirs who had captured them in pyramidal traps made of cane, and weighted with a log, to prevent upsetting and escape. So soon as a Kaffir caught one, he would slip a number of short lengths of cane underneath the trap, bind them fast and then bring the trap and capture to me. The usual bait was roasted sweet potato. It is a well-known fact that the chacma baboon is able to distinguish the sexes of the natives of South Africa. They will watch a Kaffir kraal until all the males have wandered off, when they will plunder the mealie patch in spite of the cries of the female residents.

FRANK J. THOMPSON.

* Mealies is the colonial name for Indian corn, and is evidently a Kaffir corruption of the word maize.

Mammals New to New Mexico.

MR. C. M. BARBER has recently published in the Proceedings of the Biological Society of Washington, certain notes on little-known New Mexican mammals and species apparently not before reported from the territory, some of which will be interesting to the readers of FOREST AND STREAM.

There recently came into Mr. Barber's possession the skin and skull of a young ram, an old ewe and a very young lamb of the Mexican mountain sheep (*Ovis mexicanus*, Merriam). These were killed in March, 1901, on the Guadalupe Mountains near the boundary line between New Mexico and Texas. A small band are reported to live on this range of mountains, and to pass up and down the range from New Mexico to Texas. As these specimens have been compared from those with type locality Lake Santa Maria, Chihuahua, Mexico, there seems to be no doubt that the Mexican bighorn is found in certain localities in Texas and New Mexico.

Concerning the form of beaver described by Mearns under the name *Castor canadensis frondator*, Mr. Barber has this to say:

"In September of 1898 I located a large colony of beavers about six miles below Ruidoso Post Office, on the Ruidoso Creek, Lincoln county, New Mexico. After a period of probation spent in learning their habits and how to trap them, I succeeded in securing a series of eleven specimens, representing all ages. This species lives here in the creek bank, and little attempt was made to deepen the stream by damming it. I found old cuttings up the stream to an altitude of about 8,000 feet. At the time I visited the colony they were living among the Mexican ranches at about 6,000 feet elevation. At that season (September to November) they were feeding on corn alone, although a few scarred willows were to be seen along the bank. The Mexicans had planted their corn right down to the water's edge to utilize all the available ground in the narrow valley. The beavers were cutting and dragging the corn to the stream, then floating it to their dens. In places there was a wagon load of stalks in the water. Near the dens they had cleaned the ground for a hundred feet on either side and made great trails in dragging stalks to the stream. The Mexicans could not trap them, and as they never appeared in the day time and seldom in the twilight, very few were killed."

It is not surprising that the jaguar (*Felis hernandesii*) should occur in this locality. Mr. Barber states that Mr. Nat. Straw tells him that in May, 1900, he trapped a jaguar near Grafton on Taylor Creek, Socorro county, N. M. Its length was given as 8 feet 3 inches. Several others were heard of as having been seen or killed in the general region.

Beside these larger mammals, Mr. Barber records a skunk, a ground squirrel and two weasels new to the region.

Breeding Blue Foxes.

Editor Forest and Stream:

Norton & Robinson, of Foxcroft, Me., have entered into a business of breeding the black, silver-gray and the blue fox. This business may be a paying one if they are able to sell their pelts as high as some have been sold in London. Mr. Knight, of Boothbay, Me., went into this business several years ago, but what success he has met with I am unable to say. He imported his foxes from Alaska. He sent me a very fine photo of a black fox eating a piece of meat out of his keeper's hand. I inclose a very interesting letter from Norton & Robinson, which will interest your readers. You will see there is no distinct breed as a black fox, but by selecting the blacks and breeding them together, they may be able in course of time to establish a distinct breed that will be known as the black fox.

W. O. BLAISDELL.

The letter reads:

"Blue and silver or black foxes are sports of regular breeds or types of foxes, the same as a black sheep is a sport in a flock of normally white ones, or a black squirrel or an albino deer or crow or blackbird.

"The silver (or black fox, which is the same, only the silver has a larger sprinkling of white hairs in the black fur) is a sport of the common American red fox, but being mated together will soon breed true silver or black.

"The blue fox is a sport of the white Arctic fox in the same way. The common Arctic fox is brown in summer and white in winter, like our common rabbit. They are inhabitants of the Arctic regions. Blue fox fur is worth from $10 to $25, sometimes up to $50; silver fox is quoted in the fur circulars at $50 to $300. I have known them to bring $500, and royal black fox skins have been sold in London for thousands. They breed once a year, and usually have litters of from five to seven.

I have not heard lately from Mr. Knight's 100-acre fox island in Boothbay Harbor. Two years or so ago they thought that they had some thirty or forty foxes there but as they were scattered over the whole island they could not tell much about it.

"Our original blue foxes came to us 5,000 miles from the islands of Alaska. A pair of blues as breeders sell for $125; a pair of silvers for $500, more or less."

The subject for conversation at an evening entertainment was the intelligence of animals, particularly dogs. Smith says: "There are dogs that have more sense than their masters." "Just so," responded young Fitznoodle; "I've got that kind of a dog myself!"

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

On the Stubble Among the Geese.

"It's nine o'clock, boys; you must be up at two and will then have to hustle to be in readiness before the geese begin to move in their morning flight," and suiting the action to the words we knock the ashes from our pipes and breaking the circle around the kitchen range, we go aloft and turn in and drop off to sleep with the heavens of our imagination alive with honking feathered V's of geese. We are at a farmhouse miles out from Dawson, with stubble on all sides of us as far as the eye can reach. The railroad whistle and the trolley gong may be blowing and clanging somewhere else, but around us is the stillness of death. The barking of the watchful dog, suspicious of the moon, cannot be heard, even be he hard at it, for the next house is far out of hearing.

A resounding whack upon the panel of our door, administered by the horny-fisted hand of Jim, the man of all work around the farm, brings us bolt upright in our beds. "It's two o'clock; the rig is ready and breakfast is waiting." Another forty winks added to the seemingly only forty we have just had is out of the question, and we turn out.

It's an outrage, we exclaim, to have the women folks up and around for our benefit at such an hour, but inasmuch as the cakes, sausages and coffee are steaming hot upon the table in front of us, there is simply nothing to do but fall to and eat and be thankful and show our appreciation of the cooking by eating heartily. When a housewife has, after much care and labor evolved a meal, she feels that no compliment or praise amounts to anything compared with its hearty enjoyment by the partakers. A cleared platter speaks louder than words. Decoys, shell cases, guns, a liberal supply of straw and three or four shovels are loaded into the rig, and we are off across the trackless stubble fields toward a knoll which our friend tells us is in the line of flight from the prairie lake to the feeding grounds. The morning is cold and frosty, almost cold enough for ice. For north of us the lakes are already solid, and the ducks and geese are moving south to open water. The lake is not a great distance away, and an occasional note from the roosting mallards can be heard, otherwise no sound disturbs the surrounding stillness.

Here we are upon the chosen ground. Two pits must be dug, and we set to work by the light of the lantern. I say we, but as a matter of fact, the farmer and his hired man very considerately set us to watching the horses and getting the straw out of the wagon and unloading our shell cases and preparing the decoys. It was evident that we were more expert at other things than digging pits through half frozen prairie soil.

There is no heaping up of earth around the pits, every shovelful is scattered to fall evenly upon the stubble. Geese, proverbially stupid, are yet a suspicious bird in their wild state. They will decoy to a libel upon their race in the form of a one-legged tin fraud, having nothing more than outline and color to commend it. I have frequently wondered why so many wise old ganders with the responsibilities of their charges upon them, should have gone to their deaths through a few pieces of painted tin that no one but a goose would mistake for a goose.

I think it is simply an exemplification of the old adage that love is blind, and the gander, the lord and master of the flock, seeing the possibility of additions to his harem, allows his lovesick blindness to lure him on. Some might argue that the birds in the air, by instinct, thinking the ones in the stubble have found pleasant feeding grounds, accordingly keep them company. But be this as it may, records will prove that a goose call and a few tin gay deceivers have brought many a flock of geese out of the clouds down and within reach of a load of BB's.

And Jim and the farmer are still digging, and we, having performed the arduous tasks considerately set for us, are holding the lantern and bossing the job. Under our superintendence the second pit is finally completed. Then the straw comes into play. We take it and thinly scatter it over the loose dirt thrown from the pits to make it approximate in appearance the surrounding stubble. The decoys are now evenly divided and stuck into the ground around each pit. There is nothing left to be done than to get into the pits and await the first faint line of dawn upon the horizon. A few finishing touches in the matter of scattering the remnants of straw judiciously about, when the shovels are thrown into the rig, and with hearty wishes for our success, our kind and obliging colaborers turn the horses' heads toward home, with a promise to return for us at noon and pick us up. Jim, out of the darkness, yells back to know if he had better bring the big farm wagon to stow away our game. The glimmer of the retreating lantern and the pattering hoof beats of the horses upon the stubble are lost to sight and hearing, and we are left to ourselves. Our pits are thirty feet apart upon the crest of the knoll, and conversation relieves the tedium.

We face toward the east, and with the very first streak of dawn we hear a faint honk far away and well up in the sky. The geese are on the wing. Honk! A little more distinct. They are coming our way. We strain our eyes over the edge of the pit between two shielding decoys, but we can see nothing. Honk! Honk! More and more distinct, and we finger the safety slides of our guns to make sure they are right.

There they are, well up, a dim sort of a V indistinctly contrasting with the struggling light along the earth line.

We can now hear the low gabbling of the entire flock, a chorus to the resonant honks of the leading gander. The goose call is cautiously used and all seems well, for their flight is not only yet directly toward us, but they are lowering. If we hold straight they are our meat. We move not a muscle, hold our breaths and wait. Through the look-out we can clearly outline each bird and his markings, as well. With necks outstretched they are regarding our decoys with interest mingled with suspicion, but they are still coming on. The flock set up a sort of low squealing, much like what would be given out by a basket of restless puppies. How evenly and beautifully they come on, every bird keeping his line and distance, the leader with every sense alert to danger and his every movement being watched by his followers, even to the rhythmic strokes of their wings.

They are thirty yards up and almost over our heads, when the gander, becoming alarmed, gives forth a honk that acts like electricity upon the flock. Their line and formation is instantly broken as each and every bird seeks safety for itself. But for some it is too late, for as they pass over our heads and from us, four shots ring out in quick succession, and the flock goes on, minus four of its members.

We jump from our pits, and with freshly loaded guns in hand, hasten to gather our game. One bird being wing-tipped, leads us a merry chase before we capture him. Another charge of shot would have closed his career, but the possibilities of a live decoy loomed up and we fairly ran him down, a thing not easy to do single-handed, sometimes.

We stowed our birds away in our pits, secured the winged bird with a string to keep company with his tin brethren and do the goose calling better than we could do it, and await the coming of the next flock.

More honking in the distance. It is daylight now and the rays of the sun are making objects discernible. We can see the coming birds high up and some distance off. They come straight on, but long before they are within gun shot the leader, as it were, changes his tune, and the birds keep on, but making no attempt to get nearer to the earth. They are fully eighty to ninety yards up in the air, and we content ourselves with watching them as they derisively go honking over our heads. They had no use for us and shunned our company. The leader, perhaps, knew a thing or two, very likely had had a charge of shot flung about his ears before and was not going to allow anything to override his caution begot of past experience.

The geese kept coming, flocks to the right of us, flocks to the left of us, and flocks over us, alas! far out of gun shot. More than once we longed for a .30-30 so that we could try it on that saucy gander that honked so derisively at us a hundred and fifty yards up in the air.

As the sun got higher and higher, we realized more and more that it was a poor day for ducks and geese.

At noon our wagon came, and Jim called on us to show up. We threw our three geese into the rig, securely staked down our live decoy and started for dinner. Before we reached the farmhouse it began to cloud up and the wind shifted to the east. Jim thought it meant, perhaps, a flurry of snow or some sleet, rain at least, and then we could expect some fun.

He was right. We got all three. By the time we reached our pits again it was drizzling.

We had hardly got settled and the team out of sight when, looking out from the pit I saw a lone gander not thirty yards away, poised, almost stationary, on wing, intently and with evident curiosity watching our decoys. There he was exposing himself like a wedge, bill pointed directly at me. I had often heard that a goose coming straight in would turn anything short of a rifle ball, and here was our opportunity to test it.

No one ever had a better opportunity. I knew my gun. I was using the best of all shells. I drew a bead on the point of that gander's bill with the care and precision that one might take at a thousand-yard target—and pulled.

Did the gander double up and drop from a cloud of feathers bored full of holes? Not for a moment.

With a shrill and startled honk, honk, he pulled himself together and quartered off to the right, giving me an ideal parting shot. I let him go for a few yards, giving him a chance to fall dead in midair from my point blank discharge, but instead he gained speed with every succeeding honk, until doubled up and brought to earth by my second barrel. I was more confirmed than ever that the safe way to shoot a goose is when he is moving from you. You must get under the feathers.

There were geese in the air, but they did not all come our way, although they seemed to be hugging the stubble.

Once in a while a flock came our way low, in fact, just skimming the prairie, and in one instance the birds alighted among our decoys. It was sleeting at the time and the birds wanted company sorely.

Then the snow came down in earnest, wet and sticky, packing in well under and between our collars and wetting us thoroughly. It was far from pleasant and comfortable, and when we sighted the approaching wagon early yet in the afternoon, we were satisfied to quit. Our bag was ample, because it takes but few seven or eight-pound geese to make a respectable bag.

When you drop a goose out of the heavens above and he falls plumb because of a broken neck as he strikes the hard prairie with a resounding whack, you realize that you have something.

My friend had taken an incoming flock, and picking out the leader, was fortunate in putting one shot upward through the gander's head. Turning quickly to get a second barrel into the fleeting flock, the falling bird struck him full in the back between the shoulders, breaking his aim and resulting in the discharge of the gun. My companion collapsed and disappeared into the pit. I at first thought his neck was broken, but he pulled himself together finally and declared he had shot his last incoming goose.

CHARLES CRISTADORO.

Virginia Grouse and Turkeys.

ILDA, Va., Oct. 17.—There is a very large crop of grouse this year, and there also seems to be a large number of turkey and quail. HERB.

Hunting in a Florida Jungle.

To that lover of rare but adventurous sport, that is found so often in a Florida jungle, this brief sketch, as related to the writer by one of the hunters, may be interesting.

Every old hunter will see in the following a reflex of his own experience, for surprises and disappointments almost invariably figure in any sportsman's calculation, and the hunt that is planned to fill such a volume of sport frequently dwindles into little else than pursuit, and the hunt, for which little preparation has been made, sometimes contains a whole chapter of delightful experiences, as the following briefly illustrates:

Two thorough woodsmen with a novice made the party. The trip was to consume but two days, of which the going and coming would occupy half. Trout and wild turkeys were the objects.

The day was crisp and fresh and dogs and men were in high good humor. Quail season, with all its individual charm, was "on," and as the wagon lumbered along, the dogs ran upon two or three coveys, and by noon a dozen toothsome Bob Whites were bagged. These are cleaned, rubbed with salt and pepper, and baked in an old-fashioned Dutch oven; and the tired hunter forgets fatigue, troubles disappear, and he finds himself at peace with all mankind, as the luscious tidbits of the forest feast tickle his palate.

It was only noon and the trip had already been a pleasant one. At this point it was decided that the team with the camp outfit should go on to the foot of the sand hills, where the fishing was to be done, while one of the hunters would take a circuit around the edge of the swamp to look for turkey signs. The wagon had gotten but a short distance when the report of Moseley's gun was heard—which was interpreted as a signal to wait—probably to change plans.

Soon the tall form of the hunter was seen coming across the hill, and on a near approach he called for one of the horses to be brought—with the coolness of his thirty years' hunting experience, he remarked that he had killed a wild hog!

On being questioned by the excited tenderfoot, he reported that after getting well into the thicket he found where some hogs had been rooting. Stealthily creeping up on the trail he came within sight of a drove of six wild hogs; he secured one at first shot, the rest of the bunch scampering to the swamp without having seen the hunter. This was glorious news to the party and meant changing all plans, for it was now resolved that fishing would keep and a wild hog hunt would be in order.

While Moseley went for the "game," the others prepared the camp site, procuring water and wood, much pleased at the prospect of reviving "hog killing" days in old Kentucky, when laughing negroes, the hoe cake and the cracklings, made the day a festal on the old plantation home.

Unprepared for any such work as cleaning a porker, the most primitive style had to be resorted to, which however, never daunted the Florida hunters.

A lard can was converted into an impromptu kettle, a depression was scratched in the ground, moss was pulled from the trees, knives made ready, and work began. The men hard at work soon changed his majesty from a black rooter of the forest to as white a form as an aristocratic young Berkshire.

It is supper time, and the old Dutch oven is again brought into use, and with spare ribs roasting, encircled in a ring of sweet potatoes, as the exquisite flavor floats out on the evening air, to quote from an æsthetic Florida huntsman, "the flowers close up with envy and the mockingbird swoons because he can never rival that sweetness."

On beds of moss pulled from the great live oaks the hunters slept the sleep of the just. Before day they were out with the hope of surprising some turkeys, but the shrewd birds were nowhere to be found in the belt of timber which was supposed to be their roosting place, and the hunters decided to tramp across the hill to see if by chance there were feeding on the oak mast.

Before going far, Tiner signalled that he had discovered signs of game, and tracks of a large buck were plain where he had been feeding on acorns but a few hours before. For an hour they trailed him around and around, expecting to see him every moment jump from some covert. The dogs grew frantic as a clump of small oaks was approached, and each man took a position to secure the deer, but to the chagrin of the hunters, the turkeys so long and earnestly hunted, were seen to leave the brow of the hill and fly across to the cypress timber beyond.

Finally, the deer trail led down from the sand hills into a big flat covered with a rank growth of saw palmetto. "Now," says Moseley, "I know where he is; he is lying down near the pass that leads into the drive on the other side of the swamp. This same old buck has been jumped a number of times during the past two years but always made his escape through the drive."

Progress through the sea of palmettos was slow, but Mosely, the best woodsman in the county, persistently followed the trail, a tortuous, scrubby path made by the deer and cattle, until the chase verged toward the pass on the further side of the palmetto flat. The dogs leaped and barked, trying to see over the tall thick palmetto. The entire field had been traversed now, and Mosely realized that the only chance for the deer was of his being in the palmetto bordering the swamp. Just as the edge near the pass was approached, a large antlered deer leaped from his cool retreat, which was with in a few bounds of safety, in the swamp. The unerring gun spoke as the deer made his second bound, and he fell to rise no more. He proved to be a magnificent specimen, one of the largest ever killed in the county with ten-prong antlers.

The prize was carried to the outer edge of the palmetto scrub and there carefully covered with palmetto leaves to keep the keen-eyed buzzards from devouring him.

While Tiner went to the camp for a horse to carry the game, Mosely and the exuberant tenderfoot started to hunt the trail of hogs, and by the time Tiner joined the hunters the dogs had rounded up the bunch of hogs.

In a dense jungle of saw palmetto, running vine

fallen logs, so thick that a man could penetrate with difficulty, the hogs chose their battle ground. The champing of the tusks of the large boar told men as well as dogs that it was to be a battle royal. While the dogs charged and recharged, the hunters held a council and decided that the best plan would be to scatter the game.

One of the half-grown hogs was forced into the water and made for the opposite shore of the lake, where he was met by Mosely. His quarter-mile run had not cooled his anger, and as the hunter dashed after him and caught him by the leg, he turned ferociously upon the hunter, who, by dexterous movements, kept ducking until the hog was half drowned. It was then securely tied and left squealing for the wagon to pick him up on the way home.

While Mosely was busy with the shoat, Tiner and the tenderfoot chased the others from the jungle across a strip of low swampy ground.

The other side of the jungle was a low flat ground, which was covered with water, except a high point in the center. The hogs had left the jungle and swam across the neck of water to the island. Tiner and the dogs waded across and left the tenderfoot on a stand, where it was expected the hogs would come out. From this point they scattered again, the boar coming back to the jungle, and here he took a stand from which he refused to be moved, charging the angry dogs right and left.

The tenderfoot conceived the foolhardy idea of going to the dogs' assistance, which he did by crawling through the matted underbrush on hands and knees to within a few feet of where the enraged boar was held at bay. The monster's swift charges at the dogs awoke the hunter to the fact that he was in an extremely dangerous position, for had the enraged animal charged in his direction, there would have been little hope of escape—wedged in as he was in the tangled jungle.

Watching for a favorable opportunity, he fired his gun, striking the hog in the jaw; it broke from cover, only to be turned back by the other hunter and the dogs. Coming into the heart of the jungle again, the tenderfoot succeeded in getting a fair shot at his majesty, when a ball from the .38 Marlin stretched him out.

Mosely, coming up during the commotion, asked of Tiner where the tenderfoot was. On being told that he was in the jungle trying to get the boar, he exclaimed with vehemence, "He will never come out alive!" but a shot and an exultant yell soon told that the tenderfoot was the victor.

MINNIE MOORE-WILLSON.

Across New Brunswick on Snowshoes.—VI.

Running by Compass.

THE blazed trail upon which we found ourselves seemed to lead in the same general direction as that which we were wishing to follow, it being our only general understanding of our route that it should lie for the most part to the south, and should hold in that direction a dozen miles if the nature of the country would permit it. It was now all running by compass. That is to say, we continually checked up the course of the blazes with the compass. We found that we were about five miles south of the last lumbering camp, and getting well up along the tributary of the little South Branch, when we finally concluded that the blazes were running pretty nearly on our proper course. At first we ran a little west of south, and then swung over a little east of south. We worked south about two and a half miles in this way, over simply frightful tobogganing, yet we found the grade ascended for the most part more gradually than we had reason to expect, and met only one very bad hill, up which the triumphant sleds none the less climbed in their customary fashion. In this hard going, where once in a while the sleds would break through the crust or slue around in the treacherous fir thickets, both Adam and Jack had the misfortune to break a sled shaft. I was with Jack when he broke his, and he seemed to look at it as a matter of course, and expressed no disagreement with Dame Fortune over the matter. I think he ought to have cussed a little, but he was, maybe, some shy. It was very cold, the thermometer still hanging low, so that by 11 o'clock it was twelve below zero. We had before this all of us known such a thing as frosted feet, but in this intense cold we took pains that we should not get into serious trouble. Jack and Charlie both did their snowshoeing in their stocking feet, each having on four pairs of stockings. In this way one's feet do not feel the cold, the dry snow never penetrating through the stockings at all. The frost hung in a thick white rime upon beards, mustaches and hair, and even whitened the eyebrows, as we labored along up the gradually rising country, the breath of the foremost men showing like a white cloud in the still, cold air.

Plenty of Moose Sign.

We now were entirely clear of the lumbering operations, and as quick as we did get thus clear, we began once more to see moose sign. All the forenoon and all the afternoon we were practically all the time among moose yards or moose sign, much of it bull sign and a good deal of it pretty fresh. Adam was very much pleased with the look of this country, and from this time on it will be annexed to his domain along the Tobique. The lumbering operations at the Branch camp are to be concluded thi swinter, and Adam falls heir to the abandoned camp which hereafter will be one of his regular camps. We can testify that it will be on the edge of a magnificent game range, indeed in the heart of that range, for as soon as the lumbermen go away the moose always come in all over the country they have abandoned.

Some Problems.

We stopped to "boil the kettle" at 11:30 this morning and had rather a frosty lunch sitting around in the snow. No Joe Ellis was in sight as yet, and we began to doubt whether we should get to see him before we had entirely lost all touch with the northern side of the divide. At no time did we suppose that our distance across was a very great one, but we were uneasy because we did not know how the country was going to look after we got over. We did not even know whether there were any lumbering operations going on in the country south of the divide. If it happened that there were lumbering camps as close up to the south side of this unknown country, as there were on the north side, then we would be all right, for we could easily get supplies at the camps. As much could be said in case we found Braithwaite's trapping line, but we were not sure that we would find it, or if we did, that we would find any grub in his shacks. We knew perfectly well that when one stands on the mountain side and looks off across twenty miles of wilderness, a blazed trail is mighty hard to see, and even a well-brushed out tote road or a hauling road cannot be seen at any great distance, unless one knows where to look for it. One may at any minute run entirely across a blazed trail and never suspect its presence. It would be fatal for us thus to run through Braithwaite's trail. Naturally, therefore, we were anxious to hold on to our Indian, Joe Ellis, as long as we might, so that even if we did not take him through with us he might help us on our way back if we had to take the back trail. We did not know how far we could go with the supplies we were able to take along.

Lost Man's Camp.

At 3:30 we stopped for the day, and went about building our first camp in the unknown country. All hands worked as briskly as possible for nearly two and a half hours—that is to say, until after the fall of darkness—in getting ready the bivouac. The busy little New Brunswick axes soon dropped abundance of big firewood, dry pine and frozen birch. We scraped out a hole in the snow, used a couple of stumps for supports, rolled up against them three sections of heavy birch logs, and then went to work as fast as might be splitting up equal portions of birch and pine fagots. It is necessary to use an abundance of light wood such as pine or fir to keep the icy birch wood burning, although the latter lasts longer and produces most of the desirable bed of coals which is the thing to have in an open camp of this kind.

We had a little open tent of the Nessmuk pattern along with us, but we knew perfectly well that if we put it up close enough to the fire to get any warmth from the fire, we should certainly burn the tent down. Accordingly we simply folded it up and threw it at the back of the camp, over some sticks which we thrust in the snow. It extended far enough forward to cover the face and perhaps a part of the shoulders, so we fancied we had something over us, and so slept very well content. A big log served for a pillow, and as for our bed, we made a discovery which proved a valuable one. Every one knows that evergreen boughs are highly cracked up as a wilderness bed, but not every camper knows that these boughs are cold as ice and worse than ice when, as we found them, they are covered with frozen snow. The warmth of the fire simply melts the snow, and as quick as the fire goes down your bed simply freezes up again, so that while lying on these boughs you can't very well keep warm. While Charlie and I were scooping the hole in the snow we came upon a rotten pine stump, and as we began to beat this to pieces with the axes, we found that it crumbled into soft bits, which served excellently well to fill in the hollows of the ground. This gave us an idea, and at once we fell upon certain other dry-pine stumps which were found about, and we pounded these up also, making our bed out of rotten pine wood instead of pine boughs. It was very much softer than the boughs, and in every way better for that kind of a camp. We can recommend it as a hunter's expedient when the thermometer is twenty below zero, and you have not any better bed along. I wonder where a man would have been about then with an air mattress in this bivouac in the snow, which we called "Lost Man's Camp."

That night was the coldest of the winter thus far, the thermometer going twenty-one degrees below zero. We stretched a line across the front of the camp, back of the clothing, but we found it almost impossible to do anything in this way, for though the socks would thaw out on one side, they would freeze stiff on the other. The water froze continually in the water pail in front of the fire. Of course it was necessary that we should take turns in firing. The night was perfectly still, the sky blue, and the stars very bright, and the big, white-covered, solemn pines stood all about us. It was one of those experiences such as one would not willingly let go from his memory.

In winter work of this kind there is danger if one does not know how to take care of himself, or if he be with men who are not good woodsmen. It takes a good axman to make himself comfortable in weather like twenty below zero, and for the best of axmen a comfortable camp under such conditions means two or three hours of the hardest sort of work. We pursued our wood cutting by moonlight and firelight, after we had eaten our supper on the spread-out blankets. Even Adam complained of being cold that evening, for the heat of the body had caused the snow to wet his jumper quite through during the day, and now that the perspiration was drying out and the wet cloth freezing, he found himself very uncomfortable. Adam was so big that none of the rest of us could very well fit him out with clothes, but by dint of much turning and twisting in front of the fire, he finally got dried out.

Whichever way we looked in this country, we saw not a stump, save of our own making. The fallen trees and the smoke of the woodman's fire for the first time broke this sanctuary of the moose. This was indeed the Wilderness. Upon our intrusion the moon looked coldly, unsympathetically down. The stars shone malignantly bright.

Exploration.

On the next day we found the temperature not mitigating. This was excellent for traveling purposes, for it kept the snow hard and dry. It is altogether probable that had we met a deep, soft snow, or a very wet snow, on our way across, we should never have made it through, but luck stayed with us as long as it was apparently necessary.

Adam and Charlie started out in the morning to explore a bit before we broke camp, and started ahead with the sleds. We did not care to cast ourselves loose entirely so long as we had even so good a stopping place as this, for we could not tell what was ahead. It must always be remembered as a great complicating feature in this sort of traveling, that the country is so heavily timbered that it is simply impossible to see ahead at any distance. In the Rockies one can always look around and see where the mountains are, but in New Brunswick, densely overgrown as it is, there may be a hill a quarter of a mile ahead which you cannot see. All we knew was that we had now reached nearly the head of the little tributary of the Little South Branch, which we had been following, but we were not sure whether it was Little or Big South Branch waters. On our way up we had found a cross line of blazes which we took to have been made by Ellis, or some unknown trapper. So far as we could tell, this cross line led over toward the Serpentine, whose rough country we were studiously avoiding. We found also an east and west line, and the blaze on the tree marked with the name of "Charles Cameron & Wilson Porter, of Andover, New Brunswick, June 4, 1895." We afterward learned that these were members of a surveying party which ran a line across that country and had got jolly well lost while doing it. As for ourselves, we were lost just as much as anybody ever was, and our little scouting party was a very necessary preliminary at the time.

Jack and I lay in camp, finding enough to keep us busy in chopping wood for the coming night. All about us lay the silent icy calm of the wilderness, not a breath of wind rising to disturb the white masses of snow which lay all over the forest covering. It was bitterly cold, and we found that we would freeze very quickly if we were not careful. Adam and Charlie had started out in their stocking feet, for no one felt like taking chances of freezing his feet. Adam's last injunction was that we must be very careful while chopping wood. "One little slip with an ax up in here, my son," he said, "would mean a mighty serious trouble for everybody in this party"—advice which surely was well worth following. Adam told me before he started out that day that the foregoing was the coldest night he had ever "lain out" in his life."

Mistake as to Whereabouts.

In our ignorant guess at the situation, we now thought that we were nearing the top of the Tobique Divide, and that presently we should break our way to the southward to the Miramichi country, it being Adam's intention to put in a half day finding the way down on the south side of the divide. We felt that we were free of the dreaded Serpentine, and figured that possibly we were nearing the head of the Big South Branch of the Nipisiguit. In the latter case we had nothing by way of a stream to follow down, as that river would not lead us in the right direction at all. As a matter of fact, the top of this easy ridge which we had been ascending for more than three miles in a general southern direction, was the divide between the waters of the Little South Branch and Bubar Brook, the latter being a Serpentine stream. We were to cross, before we finally got into the Miramichi country, no less than three such divides. All of which shows how little we knew about the countfy we were crossing.

"Jumped."

Before we went into camp on the preceding day, we crossed a very large bull moose trail which might have been made two or three days earlier. Jack thought he would like to go and see what was on the other end of that trail. Hence he left me in camp later in the day and started out. He followed the trail, as appeared later; for about three miles, and found himself in the middle of a fresh moose yard. He took off his snowshoes and went along the trail for a time and got within fifty yards of the moose, which, after their contemptible custom, were hiding just behind a heavy thicket. He heard them smash the brush as they went out on the gallop—one splendid bull and two or three cows. These moose we later learned came right over toward our bivouac, and went across the trail of Adam and Charlie less than 400 yards from the camp.

The Return of the Native.

Jack got back at noon, and with him whom should I see, as they came up the trail, but the long-lost, much-sought Indian, Joe Ellis. Joe's friend, John Moulton, had become homesick and left him for the settlements, carrying, by the way, some letters which we gave him against such a contingency, and which in due time turned up in the Dead Letter Office at Halifax. We gave John Moulton some money to pay postage, etc., on the letters, but reason on the premises that John needed gin more than he did postage stamps.

Jack had found Joe Ellis getting ready to boil his tea kettle in a little camp which Jack simply blundered over and which we had missed as we came up the hill. This was located on the side line of blazes which we had discovered, and had we followed that line for a half-mile, we should have discovered Joe's shack.

Presently Adam and Charlie came back from their little exploring trail, and we had a sort of reunion and jubilee by the camp-fire. Adam and Charlie had discovered that we were not yet at the top of our divide by any means, for they had found much higher country further on. On the summit Adam had climbed a tree and thence obtained a panoramic view of the country lying out to the south and west. He and Charlie had made search for a certain tree which, according to the tradition of the Ellis trapping line, once bore an inscription made by the hand of no less a person than Henry Braithwaite himself. This tree, according to Joe, he saw four years ago near the top of this divide. On it was Braithwaite's name, and the advice that his camp was but a few miles south of that tree. Such are some of the vague means of information in the wilderness. If only we could find Henry's tree, how glad we would all be! Adam said that it was not an impossible trail up to the divide from where we were, but that there was a haul of about a half mile or so which was as bad as ever lay out of doors. Ellis said that when he went up that hill he never attempted to take his sled at all, but stopped at the foot of it and packed his stuff up on his back in relays. Adam and Charlie declared their intention of returning up the hill and putting in the afternoon in brushing out, so that the sleds could get through the next day. Ellis returned to his own shack to sleep that night—another mistake which we made. We ought to have kept him right with us all the time, although, as it proved, we lost nothing more serious than a few hours' time. Joe told us that he had seen a big moose trail made the day before, made by a bull, and one which had evidently been driven some distance, since it was leaving blood on the snow crust and must have

traveled a long way before the crust cut through its skin. Moose sign, very abundant, was now reported by all hands in every direction for three miles from our camp. We dared not stop to hunt.

The Silent Watches of the Night.

Charlie and Adam came in covered with snow, tired and wet, before dark that night, but luckily they did not have to cut wood, and could make themselves comfortable at once. I stood the first watch that night, and it was an experience which will long remain with me in memory. It was still very cold, more than twenty below zero, but by 8 or 9 o'clock that night light masses of clouds began to scud across the sky, seemingly no higher than the tops of the great pine trees which stood ranged about. Then came little gusts of wind, which shook the snow down in white showers all over the blanketed forms which lay before the fire. Yet the moon was bright enough all the time, and showed in perfect distinctness the white-capped sentinel pines. The frost was so keen that continually there could be heard the cracking of the trees, sounds sharp and loud as rifle shots, now here and now yon, sometimes near and sometimes far away in the distance of the forest. Other than these sounds nothing broke the silence. And the white wilderness lay about dazzling bright, cold, very cold in its appearance. It was glorious, simply glorious. The wilderness—the memory of the wilderness, this is the best part of the moose hunt, and far more worth than many moose.

To one seated alone at the fireside on a night like this time flies by on leaden wings. I looked at my watch dozens of times, and sometimes was shocked to find that the minute hand had not gone more than fifteen minutes of distance around the dial, whereas I was sure it had reached the next hour mark. My duties consisted of keeping the foot logs against the back logs, of keeping plenty of pine faggots in with the birch, of poking any broken faggot down under the fire, and of spreading out the bed of coals so that the heat would be reflected back into the camp. So long as I kept the other fellows snoring, I felt that I was doing pretty well. Once in a while they would get so warm that I could see them pull up their feet, which is also a very good sign. Sometimes the feet of Adam and his almost equally long son Jack would stick down so close to the fire that their stockings began to smoke. Then I would lean a piece of birch bark against their feet to keep them from burning. Another duty of the watcher in such a bivouac is to keep sparks off the blankets. We had $40 or $50 worth of blankets and could not afford the loss of them.

At midnight the clouds were becoming denser and still more rapid in their scurrying flight. The wind came up in strange, tempestuous gusts, without any preliminary and as suddenly fell again. It was evident when I turned in that there was going to be a storm, and at this prospect no one felt any too well pleased. It is no joke to be caught at such a place in a heavy fall of snow.

The March in the Storm.

At 4 o'clock in the morning all of us who were sleeping were awakened peremptorily by Adam, who called, "Roll out, boys, the storm is on! We've got to get up. Crawl out now, before the blankets get wet!"

So we crawled out in a blinding fall of snow, and packed our precious blankets, the first thing we did. We fastened the packs on the toboggans soon thereafter, made our breakfast by firelight, ate up the last fragment of meat which we had, and at the first gray dawn were on the trail again to the southward, with nothing but biscuits and tea and a general trustfulness in our good luck to assist us.

This was the morning of Dec. 23, getting on toward Christmas, and there was no one there who could give a decent guess where he would be on Christmas day. We followed a general course of about south-southwest, for a time, leaving this little brook which Ellis had told us ran back into the Little South Branch, and not into the Big South Branch, as for a time we had supposed possible. We blazed trees to mark our way back in case we were caught in a heavy storm, which should obliterate the snowshoe trail, and I marked a tree here and there with our names, the date, etc., figuring that this sort of thing might come mighty useful to some other fool fellows who might be trying to do things they didn't ought to at some date later to be determined.

The brushing out on the trail which had been done the day before helped matters wonderfully. By 10 oclock we were at the foot of the big and much-dreaded hill of which Ellis had told us, and which Adam and Charlie had discovered for themselves. I shall not undertake to say how those three men pulled the heavily loaded toboggans up these awful slopes. I admit that I could not have done this sort of thing, and I found my rifle and pack all I wanted to negotiate. I do not think three better men ever went on snowshoes than the three who broke this trail across this divide.

The Top of the Big Divide.

In some fashion we finished the long and frightful ascent of this mountain side, making the top some time after 11 o'clock. At this time Joe Ellis had not appeared, although we were expecting him to follow on along our trail. We still missed the mythical Braithwaite tree of which Ellis had told us. Had we found this tree, we should in fact have been out of our troubles, for it directed us to head straight south. When we got to the top of the hill we were afraid to strike straight south, for the country in that direction dropped off so sharply that we knew we were throwing away every advantage of elevation we had gained, and we neither wanted to reascend this hill nor climb another like it beyond, if it could be avoided. Therefore it became necessary to prospect once more. Adam and Charlie went down the further side of the big hill, taking a southwest course by compass, and trying to figure out some way of getting to the south and still keeping up on the height of land and out of the dreaded Serpentine breaks. At 1 o'clock Ellis came poking along the trail, and Adam and Charlie came back, looking somewhat disgusted until they saw Ellis. Then we all "boiled the kettle" and reached that calm and resolution which pertain only to a quart of well-boiled, strong black tea.

Council of War.

Joe Ellis told us that we had passed the original Braithwaite tree and had come too far down across the hill. He said that he had a shack over in the Serpentine country, about two or three miles from where we were. It was due southwest to that camp, and this would bring us much below the place where we figured out Henry Braithwaite's northernmost camping shack ought to be. Joe said that he could get us through by a trail of his own from this Serpentine camp, which, as we figured, would require nearly a southeast course from the Serpentine camp, to the lake where Henry's camp was supposed to be. As a matter of fact, this trail from Ellis' camp to Henry's must be northeast, and not southeast. So much for scientific data. We resolved not to swing so far west, but to chance it straight across.

Ellis consented to go with us in our dash that afternoon for this unlocated lake (which, by the way, is not shown on any map of New Brunswick). He himself was afraid to strike straight south from the top of the divide. Here again we found we had made a mistake. After we had gotten across, we found that a much better trail could be made by keeping on the height of land and running south from a little barren which Adam and Charlie found on the top of the big hill. As it was, we got into pretty rough country, although nothing is impossible for the New Brunswick toboggan when pulled by men such as these.

All the time we were in the middle of moose sign. We dropped down swiftly on the southeast face of our big hill, wallowing a-plenty through snow-burdened fir thickets, crossing occasional wind falls, but all the time working down and working south. We had not yet crossed the trapping line which Ellis said ran over to the lake, but at last, perhaps a mile and a half from our lunching point, we did strike blazes again, and hence we were entirely sure that at last we were safe and that we would get through to some place of comfort before any bad storm could stop us.

At length we came to a little brook, which was the last water leading down to the Serpentine, we having now entirely left the Little South Branch waters far back of us. Hence we felt that the next water we might find must be Miramichi water, and that we must have accomplished the purpose of our trip.

We now began to ascend a long, easy, swelling divide, at whose summit I marked a tree, naming the nature of the divide, as I had the two previous divides which we had crossed. Some time Henry Braithwaite will be prowling around in there, and will see this tree, and find recorded the distance which we estimated it to be from his own camp.

Success!

At 3:20 of Dec. 23 we saw a little dark spring hole, black under the snow which framed it about. It was not a very attractive-looking place, but every fellow there gave a shout as he saw it. We had headed the last brook, crossed the last divide, reached the southeast waters, and at last broken into the Miramichi country.

We had in effect done precisely what all of our friends told us we could not do, what we really could not have done had we met any worse weather than we had, and what perhaps few parties might do so fortunately if they went across as ignorant as we were of where they were going to come out. Our party could do it again now without very much trouble, and indeed could better the trail south from the summit of the big divide to the lake where Braithwaite's most northerly camp is located.

The Trail in the Snow.

We were not, however, as yet quite out of our trouble. Joe Elis was now at the limit of his knowledge, and could not tell how far it would be until we struck lumber camps south of the point where we now were. On our way down the hill we had struck one big open piece of forest, from which a wide view was possible to the southward. It was a wild and stirring scene which lay before us—fifteen or twenty miles of panorama of the wildest of the New Brunswick wilderness, a region covered with a thick black forest and broken up into a thousand steep and sweeping hills. The roughest of this country lay off to the right as we looked southward, being in fact the rough basin of the Serpentine which we had thus successfully avoided. East of this somewhere, as we were satisfied, lay Henry Braithwaite's little, thin, indistinguishable line of blazes, hidden somewhere in the forest, we could not tell. If we should head it, or miss it, or run through it, then stern and serious indeed would be our plight.

We pushed on late into the afternoon, the snow by this time having begun to fall heavily and steadily. At last, just before 4 o'clock, as the darkness was coming on very fast, we broke out into the open, and found ourselves at the edge of a little crescent-shaped lake, three-quarters of a mile or so in extent. The snow made it difficult to see much more than to the further edge, as we looked across the lower horn of the lake. We pushed out into the open, exultant in spite of our uncertainty.

There, written on the surface of the snow, was a record which caused the blood of every hungry mother's son of us to jump a little—a snowshoe trail, and made that day!

"It's Henry, by the great Harry!" said Adam. "He's been here to-day, just about thinking that we were going to come through!"

"Yes, and he's gone back," said Charlie. "The trail is fresher coming this way than going up. He came by here about noon on his way back."

"And it's not very far to the other end of the lake," said Joe Ellis.

"We had better go up there and have a look," said Jack.

"Yes, because we're all of us just a little hungry," said I.

E. Hough.

Hartford Building, Chicago, Ill.

Pennsylvania.

Canadensis, Pa., Oct. 18.—*Editor Forest and Stream:* Three days of tramping through this section of the country has convinced me that the ruffed grouse shooting is going to be unusually good. There seem to be a great many birds, but owing to the late warm weather the foliage is still heavy, and the birds are in coveys. The swales are full of water, a condition that makes tramping far from pleasant. However, ten days of the right sort of weather will so alter these conditions that the sportsman will soon find good tramping and good shooting.

T. E. B.

Wasatch Waves.

The season now drawing to a close has averaged up well so far as the sportsman is concerned. The trout and bass season opened June 15, with but few trout rising and no bass. But as the summer advanced conditions improved, and, as a whole, trout fishing in Utah has been better than for many previous years. Especially is this true on the Strawberry Reservation, where now the imported rainbow trout are larger and more numerous than the natives. At the present time it is too late and cold for good fly-fishing, but large catches are made by trolling. I wish I could say as much for the bass. The reason why they cannot be caught will be apparent later on.

On July 1 doves had to look out for themselves, and they seemed to be in greater numbers than ever before. There was at least a month's good dove shooting before the birds became wild and separated into little bands or flew singly. Of course, all through the summer there was the average cottontail and squirrel shooting for those who enjoy such shooting at that season.

Unfortunately for the farmer and well for the chickens there were no heavy spring storms this year; neither were there late fires. Consequently, the sport with all gallinaceous birds from Aug. 15 until the present time has been "simply immense." Where the chickens have been shot from one stubble the hunter has only to go to the next field to locate another brood. For a week or two, late in August and early in September, a curious condition of affairs prevailed. The upland benches were so parched and dry that the grouse left their regular feeding grounds and came down to live with the "drummers" (partridges) on the timbered bottoms. But the first fall rains sent them back to their accustomed haunts. The dusky grouse are now up in the pines, and hard climbs always result in large bags, even for the poorest shots.

Only the duck crop is a complete failure. Where once there was abundance of feed and where four years ago I rowed a boat easily, is now only sand and mud. The carp have got away with the feed, and dry seasons and the fact that Utah Lake is being pumped out for the benefit of Salt Lake County farmers, gives no inducement to the ducks and geese to stop in their migratory flight. Indeed, there is better duck shooting to-day on Strawberry and Bear River and their tributaries, and on small irrigating reservoirs than on the larger lakes. There will be practically no duck shooting this year unless on the famous Bear River grounds near Corinne, and there, because the ducks have no other place to go, the sport should be even better than usual. To some extent the loss of duck shooting is compensated for by the numbers of jacksnipe, willet, curlews and avocets, almost unknown a few years ago, that now frequent the muddy flats.

The western legislator is not yet educated on the subject of game preservation. Our mills still dump their sawdust in the streams, and the man who would have the temerity to introduce a bill requiring the screening of irrigating ditches need hope for no mercy at the hands of his constituents. Commissioner Sharp is greatly hampered by these conditions, but I notice that several ardent sportsmen have been nominated for the next legislature, so there is a slight chance of a change for the better.

It is a good year for big game. Deer are abundant within a few miles of the larger towns, and bear and mountain lions are by no means unknown. The cañons are now filled with hunters who await the opening day for deer (to-morrow, Oct. 15). The best big game grounds in Utah to-day are in the Brown's Park region, along the lower Green River, and in the Henry Mountains. So far as my experience goes, none of these fields can compare with those of Colorado and Wyoming.

Shoshone.

Mr. Kinney on Highland Moors.

Mr. A. B. F. Kinney, of Worcester, Mass., has recently returned from a European tour, in the course of which he spent some days on the grouse moors of Scotland. The Worcester Telegram tells of it:

From a Telegram reporter Mr. Kinney had a letter of introduction to Thomas G. Henderson, secretary of the great Northern meetings, an athletic and social organization of an exclusive kind, which has been in existence since 1788, which has had yearly athletic meetings since that time without a break, with a great ball on each night of the athletic meetings, which always come in September. These meetings the distinguished persons who are in the highlands at their shooting lodges attend, and there are more of the nobility of England and Scotland and of the millionaires of America at these balls than at any other athletic or social event in Scotland.

When Mr. Kinney called on Mr. Henderson it was in the week of the Northern meetings and he was a busy man, but he took time to interest himself in Mr. Kinney's trip and inquired after a Telegram reporter, who was Mr. Henderson's private secretary prior to coming to this country. One of the special things he told Mr. Kinney was that while he was fishing in the River Ness, which divides the town, he caught fresh water salmon that weighed 34 pounds, and it was about a record catch for the rod.

Mr. Kinney was interested in his visit to Mr. Henderson, for the reason that both are great sportsmen, and are in the same business, that of selling guns and fishing tackle, powder and other equipments and apparatus for men who want to have a good day's sport. Mr. Kinney drove all over the town famous as the residence of King Macbeth, and saw the great cemetery, a large hill, the top of which looks like the keel of a ship, called Tomnahurich, which in the good old days used to be known as "the hill of the fairies," where fifty years ago corn was growing in abundance.

Returning to Edinburgh, Mr. Kinney said he was favored with all the shooting he could spend time to take, through the good offices of Speedie Bros., of Edinburgh, who make a business of renting moors, forests

and fishing privileges. The elder brother, Tom Speedie, is a naturalist, author of two books, one of which is entitled, "The Game in the Highlands and Lowlands of Scotland," written several years ago, which he said is the most interesting book he had ever read on game and recreation by a European author.

He knows all kinds of game in their habits, both large and small game, from one end of Scotland to the other, and probably rents more moors and game preserves than any other four men in Scotland.

Mr. Kinney put himself in communication with Tom Speedie as soon as he arrived in London. When Mr. Kinney arrived in Edinburgh Mr. Speedie had laid out for his American visitors a programme of what he was going to do in the way of shooting grouse, and along with a couple of gentlemen he was invited to have some shooting, which they did for a couple of days with great success. In addition to Mr. Kinney and Mr. Speedie there were in the party Lieut. A. C. Stewart of H. M. S. Venerable, C. Hunt, of London, and D. H. Cox, of Cambridge.

These men were royal good sportsmen, Mr. Kinney said, and they all had a great time. The party went out twenty-five miles from Edinburgh to a little town called Stowe, then drove eight miles in a dogcart and walked about two miles to shooting ground. They were in the highlands of that part of the country and the party had three grouse drives that day with lots of sport. The first day was foggy and there was rain, but the party shot a good bag of grouse. The second day they were favored with better weather.

"Personally," said Mr. Kinney, "I feel under great obligation for the great privileges and courtesy these men showed me while I was in Scotland, and especially when I was an entire stranger to them.

"Then I had a great day's sport in grouse driving on a moor controlled by Charles Stewart, a prosperous and wealthy merchant of Edinburgh. This moor was only twelve miles from the city and there were eight in the party, and they were driven to the shooting grounds in traps from the city. Everything Mr. Stewart had to do with, so far as our pleasure was concerned, was of the most royal order, and I enjoyed one of the grandest days of shooting with that party I ever had in my life. Mr. Speedie did much for me, to the neglect of his own business, and he accompanied me everywhere I went during those days of shooting.

"There is no shooting on the American continent but what I have had, but I have had nothing compared with the fine sport of these days in bringing down the elusive grouse of Scotland. These grouse can beat for swiftness on the wing any kind of a bird I ever saw.

"You may say, Mr. Reporter, that I have in my day met with several nationalities, but there are none who have hearts as near my standard of what men should be as those fellows I have met in little Scotland. The people there are very few clannish and hang together like brothers, and if they were not so much so, it would be a good thing if more of them came out to this country to show the people here their enterprise and thrift. By the exercise of these same traits of character they could be independent in this country within a reasonably short time.

"These people ought to be encouraged to come to the United States. We cannot have too many of them here. It is a well-known fact that there is no prejudice against the nationality of Scotland on the American continent.

"When I was in Inverness, Sept. 14, 15 and 16, there was snow on the highlands, so much of it that it drove the deer down to the village and into the woods near the towns.

"On our return trip we stayed off at the great walled city of Chester, the wall having been built by the Romans, and we looked out of the tower window from which Prince Charlie saw his army defeated on the moor near by. The walls around this city are nine feet wide.

"My trip was made more for the purpose of finding out what kind of shooting they had in Scotland, and I am very much gratified at the result of my journey. I was also very much surprised at the enormous building owned by The Scotsman of Edinburgh, probably the leading daily in Scotland, which cost $5,000,000."

In Nessmuk's Haunts.

Wellsboro, Pa.—*Editor Forest and Stream:* Some time since I saw an inquiry in Forest and Stream for a recipe for "fly dope." For the benefit of your readers I will give the formula of one which I have used for years and have found very effective, never having met a winged "varmint" which cared to take the second whiff of it:

Oil of tar	2 ounces
Oil castor	1 ounce
Oil pennyroyal	½ ounce
Gum camphor	½ ounce

Warm and dissolve together. Apply lightly and repeat as required. Olive oil is more aesthetic, but castor wears longer.

Perhaps some of Nessmuk's former readers would like to hear a word from the camp ground of the tribe of Nessmuk. Small animal life is fairly abundant about the "'baga patch," so named by Nessmuk, from the fact that when first cleared it was sown to rutabagas. The rabbits whittled my beans and peas and the red squirrels played havoc with the apple crop; they seem to know that they are immune. One of them, a female, whom I have harbored for three winters, as I was hoeing the garden the other day, was chewing up my winter sweets and spitting the chankings on me, meanwhile barking and growling, evidently in "ghoulish glee."

The deer are virtually extinct in this section; some few are left in the newer and wilder counties, but they are fast following in the footsteps of the elk and the buffalo.

There is one uncultivated and all but uncivilized lout in this neighborhood who ranges early and late, in season and out, with rod or with dog and blunderbuss, especially on Sunday, who spares neither fur, fin or feather from infancy to old age.

While deer are about exterminated in Pennsylvania, the bear seem to be increasing, the "slashings" of the lumbermen affording them shelter and food in the form of blackberries and raspberries, and the treacherous brush being a pretty effectual guard against sneak hunting them. Some few men trap for bear in a desultory way, and occasionally take one, but I know of no one who owns a pack of bear dogs, and as to overtaking a bear on foot, a man on crutches might as well undertake to overhaul a tornado.

The ground within a half-day's travel of Wellsboro is fairly covered with bear sign, and I know where one has ranged for the past three years, which, according to his track and his "bite" on the body of a tree must be a giant. Three years ago next Thanksgiving we almost had him. We struck his fresh trail with the wind strong in our favor and a heavy wet snow falling, the most noiseless time I ever saw in the woods, and Wallace M., of Galeton, took his track into the slashing while we two skirted the same. The circumstances were ideal for bear meat, but alas and alas! the man with me persisted in traveling too fast and too noisily, in spite of all I could say, and finally to my utter confounding gave a shrill whistle, trying to locate "Wal," and of course away went Bruin. He claimed to be a Rocky Mountain hunter, but lacked several degrees of being a Pennsylvania hunter. However, if the bear maintains his present range until fur gets good this fall, I shall strive to cultivate his further acquaintance, and should I succeed in getting him into the sights of a .45 Sharps, it won't be my fault if I fail to give good account.

Young Nessmuk.

CHICAGO AND THE WEST.

From Minnesota.

Chicago, Ill., Oct. 14.—Mr. S. F. Fullerton, the hustling State Game Warden of Minnesota, in a personal letter writes entertainingly regarding affairs in the busy Northwest, as below:

"I have had a little quail hunt since I wrote you. Joe Whitney, son of our expert printer, Mr. C. C. Whitney, here in the Capitol, and myself, went up the H. & D. division of the Milwaukee road, two hours' run from St. Paul, and got sixty in two days' hunt. They are thicker than sparrows up there this year, and my talk to you when here that there was no necessity for any Minnesotan to go south to get quail hunting, I think is fully verified.

"I suppose you saw in the papers about the invitation that has been sent to the President to come for a moose hunt, but I don't believe he will be able to come, because the accident that has happened to him would make it pretty hard for him to walk. All arrangements have been made, so that he would get a moose. I will try to get you a birch bark copy of the invitation that was sent him; I have one, and I think a great deal of it—it is a work of art, done on birch bark with a pen, a splendid portrait of a moose head in the corner, with oak branches and acorns, then the names of the invited guests. Of course I had nothing to do with it any more than signing the license, which I am glad to say the people are going to pay for in case he comes, and put him on the same footing as any non-resident."

The Charges Against Minnesota Wardens.

The sportsmen's world has rarely had opportunity to see action so senseless, groundless and wholly cruel, as the charges made by a local sporting paper here against the game wardens of Minnesota, who in the opinion of the local paper have been acting as a fence for "tons of illegal game." I have learned in an indirect manner this week that the State Game and Fish Commission of Minnesota do not propose to rest under these charges. They express themselves as willing to listen to any proper public criticism of themselves and their methods, but do not intend to submit to direct charges of dishonesty. The paper which is concerned in the affair, is stated not to have printed in full the earlier letter sent it by Warden Fullerton. The option is offered this newspaper of making public reparation for the injury done or of proving the charges in court. The matter is a very unusual one, and it is indeed difficult to understand why a newspaper claiming to support the principles of game protection should seek to besmirch the reputation of the most efficient set of game wardens in the entire West.

Western Men in the East.

I take from the Fredericton, New Brunswick, Herald the following information regarding Western men who have made big-game hunts in New Brunswick this fall:

"Messrs. C. B. Zabriskie, of New York, and S. M. Mather, of Chicago, who with F. M. Smith, of San Francisco, and E. L. Ransome, of New York, have been hunting in the vicinity of Trout Lake, with William Griffen, of Stanley, as guide, returned to the city yesterday, and left by the evening train for home. Messrs. Smith and Ransome, who came out of the woods on Saturday, each secured a fine moose, but the other members of the party failed to get any big game other than a lucifee, which succumbed to a bullet from Mr. Zabriskie's rifle. It measured 5 feet 6 inches in length, and he is taking the pelt home with him as a trophy.

"Messrs. Mather and Zabriskie were only out in the woods twelve days altogether, and are not in the least discouraged over the failure to score in that short time. Both gentlemen, as well as Messrs. Smith and Ransome, hunted in the same territory last year, and will likely return next season, when they hope to be able to make a longer stay.

"N. T. Depauw, a wealthy sportsman of New Albany, Indiana, who has been out with the veteran Henry Braithwaite on the Little Southwest Miramichi since the middle of September, shot an enormous moose last week. It had a magnificent pair of antlers, with twenty prongs on one side, eleven on the other and a spread of 62¾ inches. This is undoubtedly one of the largest moose ever shot in New Brunswick, and naturally Mr. Depauw is very proud of his success. He is expected out next week with his prize."

The same paper adds:

"A dispatch from New York states that the Messrs. Carnegie will start for New Brunswick this evening, on a moose hunting expedition, and have arranged to stay a fortnight. They will hunt in the Taxis River country under the guidance of William Griffen, of Stanley.

"Messrs. C. W. Feigenspan, of Newark, N. J.; Joseph Omeise and George Belchel, of New York, returned to the city to-day after a most successful and enjoyable hunting expedition to the Little Southwest Miramichi. They hunted on Henry Braithwaite's territory, and had the services of his right-hand man, Thomas Pringle, as guide. Each member of the party secured a fine moose. They had dinner at the Barker and leave for home by this evening's train."

The Squirrel and its Young.

A little domestic drama was enacted this summer up in the little trouting lodge of Mr. B. K. Miller, Jr., of Milwaukee, which lodge is located upon that gentleman's trouting preserve on the Pine River. One of the decorations of this log camp is a large papier maché mask, sometimes known as "Folly" or "Pierrot," the face and head being surrounded with a large ruff or border of ornamental nature. The face is hollow, the big plaque measuring perhaps three feet across and lying flat to the wall above the fireplace. An enterprising little red squirrel early in the summer began a tour of investigation upon the obverse side of this smiling image of gaiety. It found the face quite hollow, and conceived this to be an excellent place for a squirrel's nest. Mother squirrel therefore appropriated this locality and during the summer raised two broods of little squirrels in the dining room of the lodge, within five feet of the dining table. She got along all right with the first litter, which became very tame, running all over the place, sometimes climbing into a hammock where one lay reading, running over the chairs, tables, hat racks and everything else. With the last litter all went well until some one built a fire in the fireplace, which seemed to make things a little too warm for mother squirrel. One morning as the occupants of the lodge sat at breakfast, the fond mamma concluded it was about time for her to move. She carried off her little ones to a hidden spot in another corner of the house, running down the edge of the mask, over the mantelpiece and on the log walls with a baby held by the back of the neck, as a dog carries a puppy. She made several trips in this way, carrying one little squirrel at a time, until finally she had moved the entire family, seven, I believe, in all. These noisy little chatterers still live about Mr. Miller's lodge, and make themselves perfectly at home, although there seems to be no disposition to go back into the mask of Pierrot.

Snipe.

There was a little jacksnipe flight early during the present week, but the birds seem to have passed by in a couple of days, and for the last four days there has been no shooting worth mentioning. Several gentlemen are going out to try the marshes around Fox Lake to-day. It must be remembered that we do not hear so much now as we did formerly from the better Indiana snipe marshes, because comparatively few of our Chicago shooters go there in these non-resident license days.

Ducks.

Several Milwaukee shooters got on the Chicago & Northwestern Railroad train this morning at Princeton. They had been over on the Puckaway marshes and put about 100 ducks in the baggage car. They had some big ducks, although I saw also some bunches of mudhens. Our duck shooting is nowhere as good as it was formerly, but it is only of late years that any hunter would have thought of taking home the blue bird with the queer feet.

I was within twelve miles of Lake Poygan and heard considerable shooting yesterday and the day before. Today on arriving in Chicago I hear that there has been good sport on Poygan Lake, the big ducks having apparently shown up in good numbers.

Eddie Bingham, of the Du Pont Powder Co., this city, is back from a trip to the old home place on Koshkonong Lake, in Wisconsin. He says that the canvasbacks were just beginning to appear at the time he came away, and he thinks there will be a little shooting there within the next week or ten days.

Hartford Building, Chicago, Ill. E. Hough.

It Pays to Abolish Spring Shooting.

La Fargeville, N. Y., Oct. 1.—*Editor Forest and Stream:* A word in regard to spring shooting of ducks. Two years ago Jefferson county was given a law prohibiting spring shooting of ducks. I have lived here twenty-eight years, and up to that time had never known of ducks nesting on the stream that runs through our town; but for the last two years they have nested here. And why? Simply because they have not been frightened away in the spring.

This has convinced me and ought to convince every sportsman that spring shooting is unwise. Northern New York has a natural breeding ground for wildfowl, and if unmolested in the spring they will stay here and breed. Wild animals and fowls quickly know where they are protected, for those in adjoining counties where spring shooting is allowed fly in here and make this their breeding ground.

Ducks are growing more scarce every year, and unless we do something right away to protect them, they will follow our wild pigeons; so let all true sportsmen try and pass a law to prohibit spring shooting in the whole State and nation.

Frank L. Jerome.

Mr. Jasper Miller Sunday night took a look for the cause of a terrible commotion in his yard, and discovered a four-legged animal with something in front of him like an elephant's trunk. He seized his rifle to shoot the horrible thing, but on second thought concluded to leave the animal to his sports until daylight should reveal what it was. At last day dawned, and there was a dog with his head fastened in a joint of a stove pipe, which could not be removed by ordinary means. As a last resort Mr. Miller seized the pipe and started up-town, with the dog trotting along behind, and by the time he reached Gen. Palmer's store the procession had largely increased. The tinner's tools were brought into requisition to release the dog. And now other people are looking up joints of stove pipe to put in their yards, with a piece of beef fastened half way in them.—Columbia (S. C.) Register.

Boston and Maine.

BOSTON, Oct. 18.—The gunners are returning from the Maine woods. E. B. Bowen, of Newton, has just returned with two deer. Mrs. Bowen, who accompanied him, brought out one. E. K. Hall, who was credited with bringing the first moose head to Boston last year, has come out of the woods with one deer, leaving another head at Bangor to be mounted. J. S. Snyder, of Wakefield, has two fine specimens of deer to his credit this season. C. S. Cook, of Boston, brought home a fine buck. F. A. Lane, F. A. Davis and N. A. Davis have each brought home their deer. E. A. Hall has returned from the woods beyond Ashland, Me. He was accompanied by Mrs. Hall. They went in before the end of September, in order to have some fishing, as well as shooting. The trout fishing they found excellent in that country, where but little fishing is done. The trout were large, and though not as numerous as in the same waters in the early season, they generally came to the flies with a tremendous rush. When the open season begun they gave their attention to hunting. The leaves were falling, and were generally very dry and rustling. About the only way was to be at the runways early in the morning, and wait for the deer to come along. They got their quota of deer. A monster bull moose showed himself just at nightfall one evening. They were in a canoe with a guide. At first they thought it was an old tree turned up on the shore. The guide said: "Yes; that's a tree." But it moved. They paddled up nearer, when the old fellow began to stamp and bellow. It was close season on moose, and they could not shoot. There was nothing for it but to keep away from the shore till the moose concluded to trot into the woods. They sighed for a few moments of open season. His antlers were enormous; ten feet in the air, like great tree roots. Mr. Hall thinks that it would have taken some courage to have got out of that canoe in front of the old fellow even with a good rifle in hand.

Megantic Club members and guests are coming out of the woods from hunting trips. Generally they express satisfaction as to deer, but partridges are not plenty. D. C. Pierce and Mrs. Pierce are off for the Megantic preserve for a month. Parry C. Wiggin is back from his private camp at the preserve. Dr. George A. Payne is just out from his private camp at Big Island Pond. He made the trip to Eustis and return on his automobile. Soon they will hunt deer on horseless carriages; that is, if there are any deer to hunt. Dr. J. A. Gordon, W. R. Bateman, and W. E. Burke, of Quincy, have been spending some time in their private camp at the club house. Dr. Gordon got a fine buck deer. Frank Fallon and wife have been occupying Camp Squanto.

BOSTON, Oct. 20.—The Maine moose season opened on Wednesday, but up to Saturday no moose had been shipped through Bangor. This is a disappointment to the hunters or else the guides have failed to have dead moose on tap at the opening day, as on former seasons. A year ago they begun to come along as soon as the season opened. One or two Boston hunters have returned from New Brunswick and Nova Scotia the past week with moose or parts of them. Maine game wardens and guides are dead sure that there are a great many moose in the forests, but they say that it will take some time to get them shot and down as far as Bangor. Game Warden Pollard, in from the Alleguash region last week, reports that he saw ten large moose Oct. 2, all bulls. The record of deer shot is getting ahead of last year, the number reported at Bangor for the week having been 311, against 260 for the same week a year ago. The record for the season thus far is 562 deer and no moose; same time a year ago, 604 deer and 14 moose. Patrolman G. L. Twombly, of Station 3 Boston, is out of the woods from Lincoln. He secured a buck deer of 160 pounds, a perfect albino, with a good head. Mr. and Mrs. Fred Scofield, of Everett, Mass., have returned from a fine trip in the woods of Maine. Coming down the East Branch of the Penobscot, with guide and canoe, they came upon the carcasses of two buck deer, with antlers locked together. The antler of one deer had pierced the lower jaw of the other, going up through the mouth. The position of the carcasses indicated that they had been drowned. Mrs. Scofield took photographs of the heads locked together. Prince Hall, of Greenfield, Me., while hunting last week, came upon two bucks with horns locked, so that they could not be disengaged. The deer attempted to flee, but Mr. Hall had no difficulty in shooting both. It seems that the Dayton, O., party of other seasons is to be in the Maine woods again this fall. About thirty men are to compose the party this year according to reports. A party of about twenty has arrived from Indiana, and will be camped not far from Patten. There are also reports of a third party of 100 men being made up in the West, to hunt moose and deer in Maine. Mr. Carleton should attend to these men personally, or send a warden, to see if they "bring their potatoes with them." If he thinks that he could get 150 fat license fees out of them, if he had the law, he would doubtless be much mistaken, for such reports are always greatly exaggerated. The number of men from the West, who hunted deer in Maine last year was not half the number reported. About forty deer were registered to Boston hunters at Bangor last week. Ten deer were registered to Boston hunters, over the Franklin & Megantic road for the week. At Kineo, Moosehead, a number of deer are registered to Boston parties for the week. Two game wardens returning to Kineo, from a trip to the Alleguash region, H. C. Templeton and Warden Pollard already mentioned, say that there has been a great increase in deer in that section. During the trip 400 deer and sixty moose were seen. Ten moose were seen in one day, going through a stretch of river. At the foot of Churchill Lake five moose were in sight at one time. In the Rangeley region the third week of the big-game season has been a better one. Daniel and Augustus Kuntz and A. Gahm, of Boston, have been in camp at Long Pond for a week. The hunting was rather slow by reason of dry and rustling leaves but they brought out a fine deer. At Camp Carrabassett, Frank Vickery and W. R. Hosmer, of Beverley, got a deer apiece last week. Mr. H. D. Priest, of Boston, got a deer in the vicinity of the Mountain View House last week.

Chatham reports continue to mention a scarcity of shore birds. Boston gunners returning bring very small bags. Good coot shooting is expected soon off Monomoy, as the birds are already "bedding" in that vicinity, and finding feeding grounds that will cause them to stay. Coot shooting has already begun at the lower South Shore, after weeks of slim sport for the gunners. At Marshfield, Andrew Tribou shot nineteen one morning last week. Henry C. Phillips and George S. Josselyn have both made good bags. The gunners are getting a few brant along Duxbury Beach. Yellowlegs are giving better sport along the North River marshes. Some great cooting has been done off Scituate. The hunters go off in dories. Edward, James and Scott Edson, local gunners, went off in three dories, from Third Cliff. Returning in the afternoon, they counted 57, 18 and 12 coot to the respective boats. Along the North Shore coot shooting is beginning. At Essex River the local gunners are getting a good many birds. Boston gunners are departing for Annisquam for coot shooting.

SPECIAL.

Hunting Ducks.

WENT this mornin' to the crick,
Slipped up easy-like and quick—
Birds a-flyin' everywhere,
But there wa'nt no ducks down there;
From the marsh land floated back
Like an echo, "Quack, quack, quack."

Thought I'd find 'em in the marsh,
But discordant-like an' harsh,
Birds jest riz right up an' flew—
I was feelin' mighty blue—
On the crick again alack!
With their noisy "quack, quack, quack."

I got mad an' started back,
Wind had changed an' had to tack,
Found my tame ducks feedin' there;
When I'd shot one, I declare!
Overhead a circlin' back,
Heard the ducks go "quack, quack, quack."

Got him picked an' in the pan;
Bet that duck won't quack again!
Sat there broodin' o'er my luck,
Awful tired an' not a duck;
From the oven floated back
Mighty tame one lonesome "quack."

WM. FELTER.

LACYGNE, Kans.

New Hampshire Snarers.

DUNBARTON, N. H., Oct. 18.—*Editor Forest and Stream:* I inclose clipping taken from Manchester, N. H., Mirror. It speaks for itself. C. M. STARK.

MOULTONBOROUGH.—Fish and Game Commissioners Wentworth and Clarke came to this town Wednesday evening and this morning caused the arraignment of Henry I. Moulton, Smith Davis, Charles E. Moulton and David G. Moulton, all of this town, and C. A. Forsaith, of Sandwich, who were arrested for sending snared partridges out of this State. James B. French presided at the court proceedings yesterday morning and sentences were imposed as follows:

D. G. Moulton goes to jail for sixty days, beside paying a fine of $80 and costs of prosecution. C. E. Moulton was fined $50, jail sentence suspended. The others were fined $10 apiece and ordered to pay costs of prosecution.

The Commisioners have proof that these parties have been shipping snared birds to New York city. They were picked up by the different stage drivers and forwarded to their destination through the American Express Company. The Commissioners, in the near future, intend to bring these stage drivers before the court for the violation of the law that explicitly forbids common carriers handling birds. The penalty is $100.

The inducement was alluring, for the price paid for partridge in New York city is $1.25 apiece.

It is the general opinion here that the Commissioners have broken up the worst combination of snarers that New Hampshire contains. Residents here are pleased over the arrests and convictions.

The Shedding of Deer Horns.

IT is not very safe to predicate anything about the time at which deer shed their horns. The elk uniformly carries his antlers till spring, and sheds them with great regularity—usually in the month of April, but sometimes earlier. The common deer on the other hand sometimes shed their horns in November, and sometimes do not lose them until April, but the greater number of deer cast their horns in December and January.

In his "Antelope and Deer of America," the Hon. J. D. Caton cites the case of a four-year-old Virginia deer which shed his antlers in April in 1869, while in November of the same year he shed the antlers grown during the summer. In both cases the deer was in perfect health and in very fine condition. In 1878 there was a big buck in captivity in the park on the Boston Common, which shed one of its horns the middle of March and carried the other several days longer.

The cow caribou carries her horns very much later than the bull. He commonly drops his in December, or early January, while the cow carries hers till the last of March.

Ducks at Barnegat.

HARVEY CEDARS, N. J., Oct. 15.—I have observed a steady increase in the number of black ducks, and at present these ducks are more plentiful than usual at this time of year. They are also feeding now in this vicinity.

For the last week large flocks of geese have been seen flying southward ,and especially to-day great numbers have been seen. This increase is probably due to a sudden change in the weather, for it is considerably cooler now and the wind is blowing briskly from the northwest. Two geese have been killed by an old gunner. Amos Birdshall, who brought them over to the hotel to-day.

We have quite a number of gunners in the house, and those who went out to-day had very good luck. Quite a number of ducks were killed, including black ducks, sheldrakes, loons, not mentioning some of those useless birds which were killed simply for the love of killing. All express satisfaction with the day's gunning, and the outlook is very bright for a good season at Harvey Cedars for the lovers of duck shooting.

DAVID WHITE.

Long Island Shooting.

BAY SHORE, N. Y., Oct. 14.—*Editor Forest and Stream:* Prospects for shooting in this vicinity during the fall are better than they have been for a number of years. The duck shooters will be pleased to learn that there are already a good many broadbill in the bay, together with coot, black duck and brant. The fall flight of snipe has not occurred yet, but a few English snipe are reported on the meadows.

As for quail, one has but to take an hour or so afield in the afternoon and seldom will fail to find from two to five bevies. Indeed, it was only this afternoon I found four bevies in not over an hour's tramp. Rabbits, too, are plentiful, and as I have said before, the sportsman will find plenty of game for his gun in this vicinity.

F. A. D.

BAYPORT, L. I., N. Y., Oct. 19.—The prospects for ducking in this neighborhood are very good, large flocks of ducks being seen in the bay yesterday. The quail and deer are also very plentiful.

HENRY STOKES.

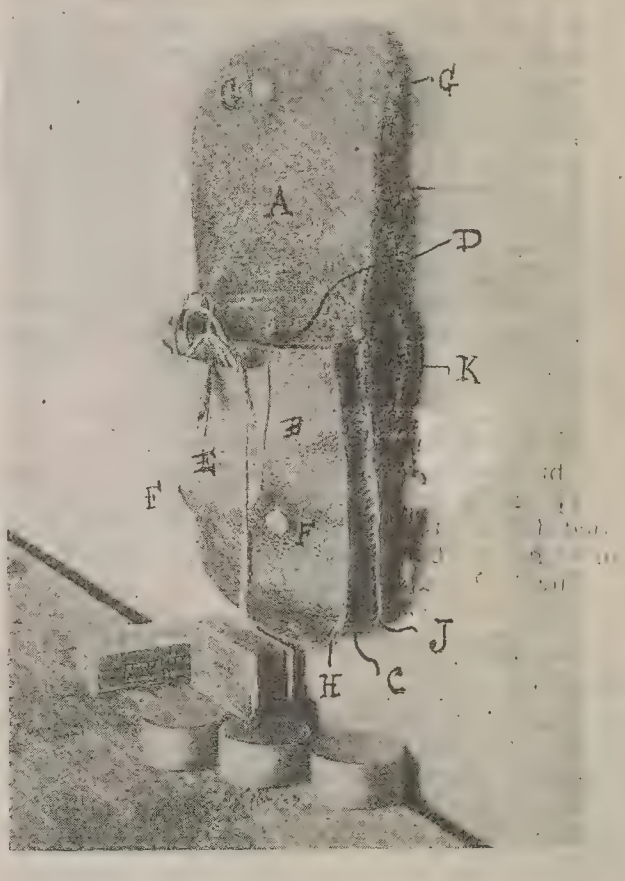
Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

No. 2.—A Useful Cartridge Pouch.

FEW articles in a small-bore rifleman's kit give more satisfaction in the long run than those he himself makes at odd times. Of course he can purchase nearly all of the necessary articles, but if he is inclined to want his traps to be exactly according to his own ideas, the thing to do is to make them. Generally this is easier than one may suppose at first thought, and while the finished article may be homely, it is certain to possess the merit of having been made to order, and the owner has the satisfaction of knowing it is just as he intended it to be. Sometimes he cannot make the manufacturer of such articles as he requires understand just what he needs, and in the end he wants a certain thing and pays for something quite different which is unsatisfactory in the end; so he saves dollars in the loss of a little time and the exercise of patience.

Persons who do their shooting with .22 and .25 caliber rifles are often at a loss how to carry cartridges and cleaning material conveniently during a day's hunt. For one, I have found a small pouch, suspended from the waist-belt, more convenient than anything else, for these reasons: If one wears a coat or a vest, he may discard it, forgetting part of his outfit, left in the pockets;



and the pouch should contain not only the supply of cartridges, but a field cleaner, oiled bits of canton flannel, oil, perhaps a small screwdriver and parts of sights (if these are interchangeable) for shooting in the dark woods and in the open. If all these articles are kept in the pouch, and the latter with the rifle, one will always find just what he requires at the time it is needed.

I have made these pouches of various sizes and shapes for my own use, but have found that one about 5 by 5 by 1 inch answers all requirements for .22 and .25 caliber cartridges. Any soft leather about one-sixteenth of an inch thick will do, as much heavier leather is hard to sew and too stiff after the pouch is finished. In the accompanying illustration A shows the piece of leather which forms both the back and flap of the pouch; B the front piece; C an inch wide strip sewed to A and B along the seams H and J; D, small pocket inside the main pocket for cartridges for immediate use; E, pocket containing field or string cleaner; FF, buttons; GG, buttonholes; K, one of the two belt-loops at rear.

The belt-loops and the cartridge pocket D are sewed on the rear pice first. Then the strip C, after which the pocket E is sewed on piece B, and B attached to C. Snaps or ordinary buttoms will answer for a fastening for the flap. All this may be done in an hour on any ordinary sewing machine; otherwise by hand.

A Government string cleaner for .22 or .25 calibers may be obtained of any sporting goods dealer. Fold it and place in its proper pocket, where it may be found

when needed. Cut some strips of canton flannel to fit the slot in the cleaner, and put them in any empty primer box, where they will remain dry until needed. They should be cut as large as possible, so that when pulled through the barrel they will fit it snugly. In another brass primer box put a little mercurial ointment for preserving the bore from rust, and in a third some pure vaseline. Take two pieces of flannel a few inches square and saturate one of them with good oil. Fold them separately and place them with the three boxes in the large pocket. There is still space in this pocket for a couple of boxes of cartridges, and a few of these should be placed in the pocket D, where they will be out of dust and handy when needed.

While hunting squirrels or other small game one can carry the pouch on the waist-belt, in front or at the right side, where it will be convenient to the right hand. The eyes need not be taken off the game in reloading, so handy is the small pocket to one's thumb and finger, while the empty shell, if kept for reloading, is dropped into the large pocket, where it will not be mistaken for a cartridge.

Small game is more often frightened by one's movements than by the noise of a breaking twig or the crunch of one's heel on dry leaves, and searching through the pockets of one's coat for missing cartridges requires motions that are fatal to one's chances of getting a shot. By carrying the small pouch at the front, the motions required in reloading need be very few, and those such as will not frighten a squirrel or a grouse, as a general thing.

PERRY D. FRAZER.

100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

88

In 1852 William Hackett and Robert Pope arrived in Red Bluff on a prospecting tour. The season was well advanced toward winter and all advised the men to defer their expedition until spring, but this excellent counsel was disregarded, and one day in the early part of September Hackett and Pope, with a couple of burros, set out for the headwaters of the McCloud River. The Indians of that early day were troublesome and vindictive, and resented any invasion of their territory, but the two friends were undeterred by thoughts of danger, and after a month's tramping found themselves on a small branch of the McCloud, flowing northeasterly down the slope of Great Mt. Shasta. Here a camp was formed and a hut built, in which it was determined to remain during the winter.

When all was completed the search for gold began. Indications were encouraging and slowly their pile of dust increased. Winter approached and mining ceased. To occupy the long hours and to provide themselves with fresh meat, the men began to hunt. Game was abundant, and one day a bear was wounded which fled from the hunters, and night coming on the chase had to be abandoned. The next day the trail was discovered and followed for over five miles into a narrow cañon. Before a cave in the rocks the bear lay dead. With the natural instinct of prospectors the two men entered the cave, intending to explore it, but their attention was quickly diverted from that purpose by the evidences that they had unwittingly come upon a formation that indicated the presence of rich gold-bearing quartz in amazing quantities. After that they left the hut and took up their abode near the cave. All winter was spent in detaching the ore and separating the rich from the poor. When summer came Pope loaded the two burros with all they could carry and hastened to Red Bluff, where he sold it for $2,000.

He made immediate preparations for a return, and, accompanied by a number of miners, started to join his partner, but when [illegible] about twenty miles from his destination the party came upon the fleshless skeleton of Hacket [illegible] to a burned sapling, and showing every indication having been tortured and mutilated by the Indians. The effect upon Pope of this awful accident was to destroy his reason. He became violently insane, and one night disappeared and was never seen again. The secret of the Bear's Nest mine died with him, and it has been numbered with the lost. The search for it is still continued, and some day it may be rediscovered. It is a tradition of Shasta that miners love to dwell upon.

Dante and the Animal Kingdom.

In "Dante and the Animal Kingdom," which has just been published through the Macmillans, Dr. Holbrook says:

Altogether Dante mentions about 100 birds, beasts, fishes and monsters. His devils are, so far as can be determined, either the hybrid of man and some lower animal, or they result from distortion, or from combining two or more lower animals. The griffin, the phœnix, the dragon, to say nothing of a six-footed serpent and of a fiery adder, are monsters. Other creatures may have a normal anatomy, but they act abnormally. Such are the three beasts and other demoniacal animals to be found in hell. Such, too, are the beaver, the pelican and the eagle that gazes into the sun. On the other hand, our poet's falcons and hawks are wholly natural. And here it is timely to remark that no other birds than hawks and falcon (except, perhaps, their quarry) were carefully studied during the middle ages. Dante mentions or describes six or seven exotic animals, the monkey, the lion, the ounce (some kind of leopard or a cheetah), the panther, the beaver, the elephant, the whale and the dolphin, for these two are exotic, as they live in the sea. Of these it is more than likely that Dante had never seen the three first named. Those animals that he knew least, Dante, nevertheless, portrays with the energy of genius. Ignorance hardly lessened his power. Those that he knew best he describes so well as to surpass all other writers of the middle ages.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

The Old Way and Herb's Way.

IT is said that instinct is the sum of inherited tendencies. True it is that the love for outdoor life and the pursuit and capture of game—fur, fin and feather—may well be called a second nature—an instinct deeply implanted and transmitted with undiminished ardor from bygone ages, and is a sufficient proof of the truth of the declaration of the opening sentence.

In early youth it was my good fortune to have access to that pastoral classic penned four hundred years ago, "The Compleat Angler," which has been the delight of scholars for centuries, which gave its author immortality, and placed all sportsmen—particularly the brotherhood of the angle—under a lasting debt of gratitude that can never be fully paid.

Its perusal quickened into life the latent love for the gentle art, appreciation of the beauties of nature, and a longing for the day to come when I should exchange the restraints and drudgery of the school room for the freedom and pleasures of outdoor life and the fellowship of the lovers of the gentle art of angling.

My youthful companions were not of the æsthetic and exclusive class who limit the pleasure of angling to success with the artificial fly, and who look down in scornful indignation, if not condemnation, upon all who follow more closely in good old Izaak's footsteps, and who despise not the sprightly grasshopper, the wriggling angle worm, the lively chub, and the festive frog.

With these for lures, we passed many pleasant boyhood days, and well filled creels often attested our knowledge of favorite waters, our persistency and success. When using the frog, we always endeavored to heed Piscator's advice: "Use him as though you loved him; that is, harm him as little as you may possibly, that he may live the longer." Venator and Auceps also contributed to our pastime and pleasure, beside the purling stream and beneath the spreading tree, where we ate our noonday meal—companions as quaint and interesting to-day as when they journeyed together centuries ago beside the gentle flowing Wye and Dove.

But years have come and gone since Walton's day, the world has progressed to higher and better things, and the art of angling has kept pace therewith. The crude and simple have given place to the superior and scientific as befits the age and gentle art—the primitive sapling and animate lure to the delicate split-bamboo and the seductive productions of the fly-tyer's skill.

But, being abundantly supplied with these and all the accessories of the modern angler's outfit, the most expert and enthusiastic angler cannot always command success even on waters where fish are known to be in plenty. The season, temperature of water, condition of the atmosphere, time of day, abundance or scarcity of food, and other causes, enter as important factors for or against success.

It behooves the angler, therefore, who is wedded to the exclusive use of the fly to be able to adapt himself to untoward conditions, to the end that he may, by legitimate means, be able to command success and pleasure where otherwise only failure and disappointment would result.

The decades of years are now lengthening since it was my good fortune to spend my summer vacation in the beautiful mountain and lake region of northwestern Maine, before the woodsman's ax had wrought the devastation now in such painful evidence. It was midsummer, and the weather was exceedingly hot. There was not sufficient breeze to stir a ripple upon the lake, and not a passing cloud intervened to temper the burning rays of the sun. My guide, Herb, who had attained to the years of vigorous manhood, was a true son of the forest. He was left an orphan when ten years old, and was then adopted by an old hunter and fisherman, who devoted all his time to hunting and fishing, there then being none of the stringent fish and game laws of the present time to prevent. With truth it might be said that Herb had passed his whole life in the woods, and that he was an apt pupil. It has been my good fortune to have camped and tramped throughout all northern Maine and in other parts of this country and the maritime provinces—to have had many guides and good ones—but to none will I award the palm over Herb. In woodcraft, in knowledge of the haunts and habits of fish and game and how best to capture it, how to paddle a canoe, improvise a camp, make a bough bed, cook a meal of victuals, make a bee line to destination through an unbroken wilderness by compass; in fine, genial and companionable, past master in all that makes camp life pleasant in the woods; cool and resourceful in emergencies, and you have a word picture of Herb, my guide on the occasion referred to, as well as on many others.

Herb is too much of a gentleman to obtrude his opinions or to offer advice unasked, and so for days we earnestly essayed the gentle art and did our best for distance, delicacy and accuracy, with very indifferent success, only early in the morning and at evening twilight did we get sufficient small trout near the shore for the frying-pan. During the day our best efforts scored only a blank.

In my despair I appealed to Herb, asking him if I must wait for cold weather before I could hope for sport with the large trout that were known to be in the lake, or if he could not do something to stir them up to take the fly, as we had no other lure. He assured me that he could and would, if I so desired.

Being assured in the affirmative, and telling him that I wished him to go just where he pleased, do what he pleased, and that I would attempt faithfully to follow his instructions, with renewed hope we started out. He paddled a few miles from camp, but at his suggestion I desisted from casting. Arriving at a favorite spot, he dropped anchor in deep water. He now informed me that he did not wish me to make a cast for at least an hour. This seemed strange to me, but I proposed no interrogatory and made no comment. When about half that time had elapsed he took a biscuit from his pocket and crumbled a small portion of it at a time and dropped it upon the water, where it soon became water-logged and disappeared beneath the surface.

This he continued at intervals until the hour passed away, and it seemed a day in length. The sun was burning hot as usual, and the water of the lake like a mirror.

He then asked me to mount a cast of the darkest and smallest flies that I had and cast very gently and quite near to the canoe. To my great astonishment my third cast was rewarded by a rise, and a successful strike anchored me to a noble trout that made a stubborn fight and furnished superlative sport before he was secure in the landing net. Again and again the success was repeated, until fatigue supervened from the sport and the excessive heat of the day. We returned all to the water unharmed, save only those needed at camp.

Asked for an explanation of our experience, Herb said that the large trout, as we all know, seek the deepest water and possibly cold springs at the bottom during the heat of summer time. From long experience he knew these favorite spots in the lake, that he had anchored the canoe over one, that in dropping the anchor among them they were startled and frightened away, that by remaining very quiet for an hour or longer they would recover from their fright and return to the place from which they fled, that after a while they saw the crumbs that he dropped overboard coming gently down, that first one trout darted upward for the food, then another and another, until nearly all came to the surface, where in their eagerness for the appetizing morsel, they were ready to take the tempting fly.

Be this as it may, it is certain that under similar conditions we had abundant success thereafter when resort was had to similar expedients not only here but elsewhere in the State, and this would tend to prove that success does not always reward only the skill of the most expert angler, the finest tackle, and the most artistic and seductive fly, and that knowledge born of experience is quite as reliable and valuable as the learned disquisitions of the books.

WORCESTER, Mass.

Ethics of Sport.

As Observed in California—What Sportsmen Have Done in a Few Years.

AVALON, Cal., Oct. 12.—*Editor Forest and Stream:* In a recent issue of the FOREST AND STREAM appears the following reference to Santa Catalina:

During a recent contest in the waters near Catalina Island, the participants caught with hook and line more than 400 albicore, at least 10,000 pounds of fish, but as the meat is worthless, Justice Allen afterward characterized the tournament as wanton slaughter which should be prohibited by law. Fishermen and boatmen contended that albicore were useless except as food for other fish, and that they served this purpose after being caught. The ethics of sport have been observed here as elsewhere only in a vague manner. Perhaps a goat hunt taken next day by fourteen boys of the Naval Reserve, who accomplished twenty-eight kills, was not accurately in line with the ideal conception upheld by a large number of other hunters, though all the meat was afterward consumed in camp. A fair judgment would demand exact knowledge of local conditions.

I think your correspondent hardly means to say "the ethics of sport have been observed here as elsewhere only in a vague manner," as, if the truth were known, nowhere in the United States is there so true a sportsmanlike feeling as at Avalon, which is remarkable when it is known that this little town on Santa Catalina is the most important fishing or angling locality in the country. Every year nearly 100,000 persons visit this island, and every male goes fishing, and many females, hence it would be singular if at times there was not some unsportsmanlike conduct, but certainly not sufficient to justify the above statement that the ethics of sport are vaguely held. The catch of 400 albicores which is mentioned was made under peculiar circumstances. All the year the one or two hundred boatmen or residents of Avalon interested in angling as a business, had fished with their patrons every day, but never had caught a fish themselves, so when there came an end to the season in the last of September and it was possible to have a rest of a week, before the fall season began, the boatmen and gaffers and their friends got up a tournament of two days, and on one day ran into the school of albicores and caught 400, or about ten to a man in one day. It was the one day in the year to them, and those familiar with the case are not disposed to criticise the men, knowing that nowhere in any country do boatmen so constantly maintain a high standard of sport. Exactly what has been done at Avalon and was done to elevate the standard of sport was shown in a speech or address made by Chas. F. Holder, at the banquet of the Tuna Club, when he retired from its presidency some three years ago. The matter referring to the point in question was as follows: "It is a matter of congratulation to every member of the Tuna Club that a high standard of sport holds in these waters, and that every boatman has an interest in the cause." Mr. Holder had been asked to give a history of the Tuna Club and its work, and the following bears upon it: "When I first visited Santa Catalina eighteen years ago, the splendid game fishes of this region were slaughtered without rhyme or reason. There was not a rod in use, and it was the custom for parties of from one to twenty to go out with from one to five or six hand lines and the idea seemed to be for each fisherman to haul in as many as possible, and often hundreds of pounds of splendid fish, as game as the salmon, ranging from ten to fifty pounds—yellowtails, sea bass, albicore and others—were brought in only to be left upon the shore or towed out to sea. I believed that this could be stopped by appealing to the latent spirit of fair play for game which every one has, and I began fishing with a light rod and 21-thread line; was laughed at at first by the 'cod line' hand liners, but only for a short time, as I soon demonstrated that I could take the largest fishes with my rod, and the idea soon became prevalent that a 'true sportsman' only used a rod, and in a remarkably short time the feeling was so strong that no one had the temerity to go out with a hand line. What was the result? With a light rod no one could catch a twenty-seven-pound yellowtail in less than ten or fifteen minutes, and it became a physical impossibility to over fish, and the average catch

(maximum) became from five to eight fish, generally the former, per day. Result: Not so many fish caught; by 75 per cent. and 100 per cent. more sport. I explained to the few boatmen who had no conveniences at this time how my fishing boat on the St. Lawrence was rigged, with chairs, etc., for the comfort of the angler, and suggested the introduction of the water glass, or glass-bottomed boat which I had used in Florida and which was in use in the Bermuda islands, and in a short time finely equipped fishing boats appeared. To bring to the aid of the 'reform movement' other sportsmen, I suggested or founded the Tuna Club, the original members being Mr. H. K. Macomber, Mr. E. L. Doran, Mr. Clifford Scudder, of St. Louis; Mr. Fitch Dewy, of Toledo, and myself, and some twenty or thirty well-known anglers did me the honor to elect me first president of the club. I drafted the following sections of the constitution and by-laws:

"'The object of the Tuna Club is the protection of the game fishes of the State of California and to encourage and foster the catching of all fishes, and especially tuna, yellowtail, sea bass, black sea bass, etc., with the lightest rod and reel tackle, and to discourage hand line fishing, as being unsportsmanlike and against the public interest.

"'No records will be considered if made on lines larger than a 24-thread Cuttyhunk, this being the limit, and the club recommends an 18-thread line for yellowtail and sea bass.'"

The club soon had 200 members, and as honorary members Theodore Roosevelt, Caspar Whitney, Grover Cleveland, President Harrison and many more sportsmen and anglers whose names emphasized the fact that game had certain rights and that those rights were to be protected at Santa Catalina. Mr. Holder now suggested that the Tuna Club give a series of tournaments, offering prizes of cups, medals, rods, etc., to encourage the use of light tackle, which did much to spread abroad in southern California what a true sportsmanlike standard was. These tournaments were enjoyed by thousands, all conforming to the rules of the Tuna Club regarding light tackle, and to see a large line or a hand line used at Santa Catalina is to make the unfortunate owner the butt of the entire fishing community; in fact, it would require more than ordinary courage to attempt it. How well the boatman and gaffers have joined hands with the club members is shown by a glance at the fleet of boats in Avalon Bay devoted to angling. A moderate estimate as to the value is $100,000. The boats are mostly launches for tuna and yellowtail fishing, handsomely fitted, and with an equipment of rods and reels in some cases valued at $1,000. Hand lines would be a much cheaper outfit for these men, but they all have Vom Hofe reels from $25 to $50 apiece; silver-mounted rods of greenheart, and the very finest and most up-to-date tackle the market affords. Not one of these men carries a hand line; even ten-foot sharks are caught with twenty-one-thread lines, all of which suggests that of all places in the world, Santa Catalina Island makes the most determined effort and has made it to stand well before the sportsmen of the world. Enormous catches of fish have been shown here at times. One of the largest was of yellowtail, showing about fifty fish, but this was the catch of four rods in a whole day, or about twelve fish apiece, and as the anglers came three thousand miles to fish, they were pardoned. The catch of even five fish here seems large, as they are so heavy—the yellowtail running up to fifty pounds, white sea bass seventy pounds, sheepshead twenty-five, black sea bass five hundred pounds, tuna three hundred pounds (record 251 pounds), albicore one hundred pounds (record sixty-three pounds). When it is remembered that this peculiar angling ground with its monopoly of tuna fishing and its vast schools of big game fish is fished the year around by hundreds of anglers from all over this country and Europe, it would not seem strange if occasionally some member of the "unsportsmanlike fraternity" got in his deadly work, but the anglers and boatmen of Santa Catalina submit that for a new place and a new country they have done fairly well, and submit with all courtesy to your correspondent that the ethics of sport are not observed in a vague manner at Santa Catalina Island.

21-Thread.

Angling for Lafayettes.

It is not often that the anglers who haunt the piers along the North River experience much excitement or catch any fish large enough to furnish their families with a meal, but when the lafayettes are running they furnish sport for thousands of persons who do not otherwise catch many fish during their twelve months of toil.

The lafayette is not a large fish, it being only four to six inches in length, but it is a gamy fellow, and when it comes in with the new flood tide in large numbers, as it often does, catches of a hundred or more are not remarkable in an afternoon's fishing. Of course many of the persons who fish for these lafayettes do so for the sport of catching them, just as many anglers make big catches of brook trout, and put back all but a few of the larger ones; but others catch them for the pan, and carry them home at nightfall with great pride. It is usually in late August that the word "Lafayettes are running." is passed along the line, whereupon the demand for sandworms equals and often surpasses the supply kept for such emergencies by riverside boatmen and small shopkeepers. Then it is that space on all the piers is at a premium, and every boat that is available is pressed into service by the people who hurry to the river in groups or singly. Not much space is required to cast a hand line or manipulate a rod along the string pieces of the piers, or from some canal boat or schooner moored alongside, but very often there is no space for one more, so that the late arrivals must seek standing room elsewhere. And it is a motley crowd. Old salt-water anglers who fish at every opportunity throughout the year; boys of all sizes and ages; women who for the time being become as enthusiastic over the fun as their husbands do at all times; whole families, each member equipped with some sort of gear with a hook or two at the business end. All along the river, while the lafayettes are in these waters, the same scene is repeated every day and all day.

The tackle used is simple. Hand lines are most in evidence, but those who own ordinary salt-water rods use them. There is little space on the crowded piers for fancy casting, and perhaps this accounts in a measure for the style employed in projecting the line as far out in the water as possible. The hand liners grasp their lines some two feet above the heavy sinker and toss it out by a vigorous underhand swing, or, when there is room, by whirling over the head a couple of times before letting go. The rodsters use multiplying reels sometimes, but generally the large wooden salt-water reels that sometimes rival a diner plate for size. In every case the sinker is very large. This is necessary in order to keep the line taut against the strong tides, and it is easier, too, to cast a heavy weight in close quarters. The hooks being baited with sandworms, the line is reeled in until but three feet of it shows beyond the tip of the rod. The rod is carried well back over the head, and a vigorous forward swing imparted, which sends the sinker and line far up and out, to drop in the deep water many yards distant and run until the sinker touches bottom. Then enough line is recovered to keep it taut, and a bite is anxiously awaited. The sinkers are generally pear-shaped, and are attached to the end of the line, with the snelled hooks further up, so that they may be held in a horizontal direction by the tide some distance above the boat.

With several ounces of lead holding the line on the bottom of the river, and a slack line, it need not be supposed that the strike of a five-inch fish will pull the angler overboard, but the fact is that the lafayettes give a taut line a goodly twitch, considering their size, and make their presence known by considerable fuss as they are being reeled in. Those who fish with more than one hand line attach one or more of these to bits of stiff wire carrying tiny tinkle bells at the end. The wire is pushed into the stringpiece of the pier, the line given a turn round it, then coiled, and a strike is signalled in this way.

It is all very amusing, this scramble for the little lafayettes, and yet thousands of persons get enjoyment out of it in their few leisure hours, and it is of record among them that a mess of lafayettes is not half bad. Let those who have the patience try it.

Perry D. Frazer.

A Pearl River Camp.

Jim and Walter Kirkman, Will Norsworth and I, when boys living in Mississippi, formed a quartette of inseparables. We ranged in ages from fifteen to eighteen years, the two first-named brothers, Jim and Walter, being respectively the youngest and oldest of the four.

We were just about the average, as boys run, being neither so good as to cause our loved ones uneasiness for fear our earthly career would be brief; nor so bad as to cause them constant sorrow for fear it would not.

We were all fond of the sports that attract boys, and hunted and fished together in season and out.

Near our home were two large creeks, which passing on either side of the town, flowed into what was called the "Big Black Swamp," and after adding their mite to the great swamp's water-soaked area, made their way by tortuous windings to the beautiful Pearl River, twelve to fifteen miles away. These creeks we fished, seined and muddied each year, as the fishing season rolled around, but the river we had only visited once or twice, and then for very brief stays.

We had heard much about the size of the fish in Pearl River, and wonderful stories were told by the local fishermen of the freedom with which they took the bait. Both of these essentials to good sport were lacking in our creeks. The fish were small and seldom bit freely. Seining occasionally gave good returns, but generally when the seine came up with a good haul of fish, there would be from one to three vicious old stump-tailed moccasin snakes thrashing around among them, which always caused us to drop fish, seine or any other impediment to speedy flight, and take to the high bank.

Muddying, of course, we never really seriously indulged in, but only at times, when the water was very slow, and we wanted to get into it, would we engage in this practice. For the enlightenment of the uninitiated I will explain "muddying," which is a sport confined exclusively to the "lowlands," and practiced generally by the small boy of African descent. When the season is very dry the creeks and branches become a succession of small pools, in which the fish collect.

The bottoms are all muddy and the fishermen get into the pool with a hoe, or bit of brush, and vigorously stir the bottom until the water is thick with mud, then as the suffering small fish seek the surface for air, they are caught by hand. Does not sound much like sport, but your fly-fisherman, with his hundred-dollar outfit, will not have as much fun in a year as a small darky in a well-mudded pool will have in one half hour.

Numerous parties of adult sportsmen were in the habit of camping out for a week or two each season on the river, and nearly always reported good luck and a good time, so we at last determined that we would go on a real camping trip. Our first intention was to join one of these adult parties, but we soon found that our good company was not as eagerly sought after by these more experienced sportsmen as we had expected, so we determined to get up our own party and go our own way.

We began planning the trip in April, and got away the latter part of June. Convincing our several households that we were mature enough, and discreet enough, to be trusted for a week camping out was the most serious and difficult part of the undertaking, but this we finally accomplished, and began our preparations in real earnest.

After acquiring all available information, and holding many consultations, "Long Lake" was selected as our destination.

Long Lake was one of many so-called lakes, which were in reality bayous, that bordered the Pearl River in central and south-central Mississippi. The river being a very tortuous stream, flowing through a light sandy soil, often formed entirely new channels by cutting through across the neck of some big bend, and then as the openings of the loop filled with soil and drift, a long piece of still water would be formed, which made an ideal fish preserve. Our selection was a long loop, probably a mile around, with its ends both open into the main stream, and not more than two hundred yards apart. The current did not flow into it except in high water, as the upper end was partly closed by a high bank of sand that had gradually formed during freshets in the river.

There were many conflicting opinions to be reconciled among us as to the necessary equipment, outfit, etc., essential to the most complete enjoyment of a week in camp, and many loud and long discussions were held before a decision was reached.

At first our discussions were hampered with a condition, and all opinions and suggestions prefaced with "Now if we do go," but finally when we had all secured parental sanction to our plan, the bridle was off, and every fellow voiced his sentiments freely, and backed up his position with earnest argument.

A boat was necessary, but this otherwise difficult problem was early eliminated by the kindness of a local sportsman, who kept a boat on the lake, and promised us the use of it for our stay. Other matters of preparation were more difficult to arrange. After three weeks of discussion, sometimes cool, and at other times somewhat heated, the problem of what to take, and how much, was not only unsolved, but, in most cases the outfit suggested had steadily increased in items and amount.

We finally agreed to cease all discussions for one week and then meet to consider each one's list of what he thought necessary for the trip, each list to be reduced to writing. A two-horse wagon was what we had agreed upon to carry us and our outfit to the lake, and when we finally met and submitted our lists, a freight car would have been overloaded with any of the four. Walter had in the main the best and shortest list, but after we saw that he had put down four dozen towels and a dozen cakes of soap, we took little further interest. Will's list read well until he came to the items, "Two beds and mattresses," when he was promptly howled down.

Jim came to grief over a cook stove, which he insisted was an absolute necessity; while I suffered complete shipwreck in trying to hold up these items in my list: "Plates, cups, saucers, knives, forks, spoons, and a table cloth."

As we did not expect to get off until some time in June, and the question was a pleasant one to discuss, we went at it again as a committee of the whole, and the result was that we finally took what there was room in the wagon for, and left behind as much again that we had intended taking.

It was out of season for all game, except [illegible] but we would have called off the trip ins[illegible] allowed firearms.

There was well-grounded rumors of bear in [illegible] and semi-wild hogs ranged the canebrakes, s[illegible] of defense arms were unanimously voted [illegible] When collected, they consisted of two double-barrel muzzleloading shotguns, and a .38-caliber Colts revolver. Walter and Jim furnished one shotgun, I the other, while Will contributed the revolver, and we hoped that his father would have no occasion to use a weapon during our absence, as Will did not consult him about borrowing it for the trip.

My gun was a 12-gauge, medium-weight, serviceable weapon, without any special points; but the one contributed by Walter and Jim was a curiosity. Nothing bigger had any of us ever seen off of wheels in the gun line. About 8 gauge, with iron in proportion to its caliber, not one of us could do more than swing it to horizontal and fire quickly before the weight pulled it down; and one shot a day was all a fellow generally cared about making with it, as it took twenty-four hours for even a boy to forget how it had kicked.

To provide bait for fishing, we made a small seine for minnows out of coarse netting and caught a quantity of roaches. Crickets were considered the best bait for bream, but when we had hunted out the most favorable covers for this insect, for the better part of two days, and only secured a dozen or two, we remembered hearing that roaches were almost as good.

An old abandoned smoke house in the rear of [illegible] and Jim's yard teemed with them, and by entering [illegible] denly with a bright light after dark, we easily ca[illegible] a few trips as many as could safely be accommoc[illegible] our bait can, made of a leaky two-gallon milk [illegible] further ventilated with numerous holes punched with a small nail.

Catching the roaches was the most unpleasant part of our preparations, as they had an oily, creepy, disgusting feel to the hand like nothing else that we had ever handled.

All our preparations being completed, we selected Walter and Jim's home as the rendezvous, and collecting our outfit engaged the team to be on hand at the first break of day, Monday morning, June 20. There were two beds in the boys' room, and we turned in early the night before, but there was very little sleeping done. Whenever conversation ceased long enough for us to doze off, one or another would wake with a start and strike a match to see the time of night.

Morning came at last, and found us waiting impatiently in the front yard for the wagon, which, fortunately, was on time.

Making a hurried selection of what the wagon would hold, we loaded it in, climbed up on top of the pile and were off.

Lewis Hopkins.

Clams on Hand for the Clam Bake.

Mr. Charles Alexander, who lives at Rumstick Point, Rhode Island, having encountered the usual difficulties in procuring clams of good quality at the desired time, has invented an ingenious method for overcoming this difficulty. A series of heavy boxes was put down alongside a pier, and their covers perforated with holes. The clams, when procured, were transplanted into these boxes, which had been filled with about eighteen inches of sand. Here they grew readily, became very fat and tender, and were always on hand when desired for baking. This device not only allows the inventor to have clams whenever he wishes them, but the clams actually grow in size; and it is the testimony of every one who has tried them that they are superior in quality to those dug directly from the shore. Mr. Alexander has hereby demonstrated the feasibility of a method which the Rhode Island Fish Commission thinks will be used extensively by others who have land bordering upon the shores of Narragansett Bay.

All communications intended for Forest and Stream should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Fish and Fishing.

Unneighborly Conduct.

THE Department of Fisheries of the Province of Ontario have been endeavoring for some time past to secure specimens of eggs of the ouananiche of northern Quebec, for the purpose of introducing them into Ontario waters, but in every instance their efforts have proved unsuccessful, those controlling the most accessible waters in which they are found in the Province of Quebec being apparently determined to prevent the further distribution of the variety. The very same fish, anatomically considered, is found in the lakes of both Maine and New Hampshire, and I am not aware that any attempt has been made in either of those States, as in the Province of Quebec, to prevent the export of spawn or specimens of adult fish for breeding purposes. It is true that the ouananiche or so-called landlocks of New Hampshire and Maine, are for the most part bottom feeders, and attain a much larger size than their near congeners of Lake St. John, but different habits surely do not constitute a different variety, and it would be by no means surprising if a change of habitat made a great difference in the habits of a fish. I see no reason whatever to doubt that the progeny of the Maine fish transplanted into the cold rapid waters of northern Ontario, would afford quite as good sport to the fly-fisherman as the ouananiche of the Grand Discharge. In Newfoundland, however, the Ontario people will find an abundance of ouananiche, perfectly identical in both habits and habitat with the ouananiche of Lake St. John; and many of the rivers of Labrador, as frequently mentioned in these columns, contain large numbers of them.

The question of replenishing depleted waters with new forms of fish life is receiving considerable attention at present in the Province of Ontario. The qualities of the black bass are carefully noted, and while there are few so bold as to challenge its superiority as a game fish, there is much adverse criticism of its conduct toward [illegible]ighbors, and much alarm is expressed lest it should [illegible]anted in waters whence it might obtain access to [illegible] or streams containing trout. The young of the [illegible]led trout have certainly enough of dangers surrounding them, without the addition of new ones, and not the [illegible] of these arises from the cannibalistic tendencies of [illegible] own parents. This is a crime which none can seriously lay against the black bass. Instead of feeding upon the eggs of their kind, as soon as they are deposited, as both trout and whitefish have been known to do, the parent bass remains on guard over its eggs until they are hatched and only abandons its young when they are able to take care of themselves. Their fecundity is so great that a few pairs of parent fish soon suffice to populate the waters in which they are placed. It is certain that much unnecessary and unintentional destruction of parent bass in Ontario waters is due to the too early opening of the fishing season. Bass may at present be caught in Ontario on June 18, though many of the fish taken for several days after that date are found to be full of spawn. It will be remembered that the North American Fish and Game Protective Association has already recommended that the close season should be extended to July 1, and efforts are now being made with the Federal authorities, which it is confidently expected will prove successful, to have this recommendation carried into effect.

It is understood that means are to be adopted by the Ontario authorities for the introduction of steelheads from British Columbia, but the suggestion has been made [illegible]e rainbow trout would be likely to succeed bet[illegible] would certainly afford better sport. It may be [illegible]th these varieties of Western salmonidæ will, ere [illegible]e numbered among the game fishes of the Province [illegible]tario.

The Result of Protection.

Nothing speaks more eloquently for the cause of protection of angling waters than the records of big fish constantly captured in the Thames and in other streams which are surrounded by a teeming population. The angling column of a small English sporting paper records that during the late trout fishing season on the Thames, the average weight of sixty-four trout caught between Teddington and Lechlade, was four pounds ten ounces. The weights of some of the trout caught at Henley are given as follows: 10 pounds 4 ounces, 9 pounds 11 ounces, 8 pounds 8 ounces, and two of 7 pounds 8 ounces each. The largest of the above measured 2 feet 4 inches in length. These fish are, of course, the Von Behr or brown trout, the common brook trout of Europe, known in science as *Salmo fario;* and in the dimensions to which they attain in some of the English waters, recall the "Fordidge trout" of Izaak Walton, which are caught in the Stour, near Canterbury, and of which Walton tells us that many of them are "near the bigness of a salmon."

It will be welcome news for the readers of FOREST AND STREAM, many of whom are members of the Sportsmen's Fish and Game Protective Association of the Province of Quebec, to learn that the Hon. Mr. Parent, Minister of Lands, Mines and Fisheries, has marked his appreciation of the work being done by the society by according it a Government grant of $400 a year. The Association is perfecting its organization, and is already striking terror into the hearts of many notorious offenders against the fish and game laws. Shortly after the close of the trout fishing season in Quebec, one of its officials confiscated seven dozen of fine trout which had been illegally taken out of Lake St. Charles, and the offender was also fined. On the principle that it is not all of fishing to catch fish, the Association is bending itself to the task of protecting those forms of desirable bird and animal life which contribute to the pleasures and the attractions of a holiday spent on lake or stream. Beavers and their wonderful dams are by no means the least of these attractions, and when the Association was instrumental, at the last session of the Legislature, in having the present close season for beaver extended until Nov. 1, 1905, it also determined to do its best to enforce the new law. Admirers of these interesting little animals will be glad to learn that the Association has recently made a seizure of no less than fourteen live beavers, which had been illegally captured and were on the point of being shipped from Quebec to Mr. Menier's island of Anticosti, for his private preserve.

E. T. D. CHAMBERS.

CHICAGO AND THE WEST.

Grayling and Trout.

It has always been supposed by the anglers of this part of the United States that, of the two fishes, the brook trout was more aggressive and more destructive of its neighbor than the grayling. It is commonly understood among Michigan fishermen that when the trout once get into a grayling stream the grayling is bound to disappear, and this gradual disappearance of the latter fish, which has amounted practically to the extinction of the species in most of the State of Michigan, has always been attributed to the introduction of the trout into the grayling streams quite as much as to the logging operations. It is a matter of some surprise to Western men to read in the English angling papers of a point of view regarding these two fishes which is diametrically opposed to that which obtains in America. Thus, in an English angling paper, Mr. S. Ludlow, writing of the fishing along the Teme River, remarks: "In conversation with an old angler as to the trout in this part, he says: 'Trout are more scarce than usual, but grayling are more plentiful and larger this season, and I think the grayling destroy the trout spawn.'" This certainly is a new thing in angling lore, and if it be in the least correct, all one can say is that it is a fact hitherto undiscovered in our grayling country. We have always been accustomed to look upon the grayling as a beautiful and somewhat helpless fish, doomed to extermination by reason of the greater strength and rapacity of its cousin the brook trout. The grayling does not seem to be as highly esteemed in England as the trout (*S. fario*), and once in a while one sees argument upon the question whether grayling ought to be introduced into streams already supporting trout. The anglers of Michigan look upon the matter in precisely the opposite way.

A Trout Stream in October.

A friend and I favored with an invitation, dropped in for two or three days of rest and quiet at the "Woodpile," on the Pine, up in Wisconsin. William Wood, the preserve keeper, is now engaged in catching his breeding trout for the hatchery, and we helped him for a while, to the extent of leaving thirty handsome trout in his live boxes. My companion, Mr. L. Frank Baum, well known in this vicinity as the librettist of "The Wonderful Wizard of Oz," was a novice on a trout stream, but turned out as handy with the rod as with a lyric. He took nineteen beautiful trout, the first he ever caught in his life, and went well nigh crazy over the beauty of the fish. "It'll cost him about $500," said William Wood, sententiously. He was right. Less than an hour later Mr. Baum began to ask William questions about the proper outfit, rods, flies, leaders, etc. If he gets off with an expenditure of $500 he is beating the record of most of us. It gives me much pleasure to mislead a fellow citizen in this way and to make an angler out of him.

Most of these large trout for the hatchery are taken on bait, William using pieces of sucker or chub for that purpose. We took some smaller trout on the fly, but finding them hardly large enough for use in the hatchery, discontinued the use of the fly, although even at this time of the year one could have sport with the fly did he care to do so. It would be legal also upon this hatchery stream, did one care to avail himself of the legal privileges. William says he will go on gathering his big trout until he has 100 or more in the pens. He plants about 100,000 fry every year, although he put in only about 70,000 last year.

William tells me that the mink are great enemies of his breeding trout, and he once lost several dozen to one mink, which killed them and laid them out in a row "as though he intended to count them," as William expressed it. He saw a good deal of mink sign along the stream, and once caught one dark rascal out on the grass a little way from the stream. William, who is an excellent shot with a revolver, opened fire upon his minkship, and at the second shot turned him over, although unfortunately the mink was able to get down a hole, where no doubt he soon terminated his poaching career. That same night, as William was coming home in the dark, he heard something running through the brush close to him, and, guessing at once what it was, opened fire with his trusty gun. His second shot hit the animal, which at once took to a tree. William went into the house got a lantern and a shotgun, and presently tumbled a big fat coon out of its perch in the tree. What with coons, mink and muskrats he gets just a little taste of variety in his work of watching the prettiest trout stream in Wisconsin. It is the boast of Mr. McLeod, Mr. Miller's friend on the stream, that there is no day of the year when one cannot take trout on the fly, and I presume possibly this might be true if one cared to put it to the test. Our trout we found well advanced toward the spawning season, very brilliantly colored indeed with flaming orange, red and silver, but it will be a month or so before the spawning begins on that stream. It was always William Wood's great ambition to have Mr. A. N. Cheney come up and see his little hatchery, and the death of the latter lamented gentleman was felt very deeply by William, although the two had never met.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

A singular story comes from St. Malo. A vessel bound thither from Jersey with coal, came up on the way with a handsome yacht in full sail, but apparently deserted. The captain threw a rope on board, and tugged the yacht along with his vessel. Presently one head after another to the number of four peeped out of the yacht's cabin. On reaching port the captain sent for the gendarmes, who took a boat and boarded the yacht. Two of its four occupants had disappeared, but the remaining two proved to be French naval deserters from Brest, who had escaped to Jersey, and there seized on the yacht Louisa, gone out to sea, and fallen asleep. The two men will be sent to Brest to undergo a court martial, and the yacht will, of course, be claimed by its owner.

The Carp as a Sheep Doctor.

THE Annual Report of the Bureau of Animal Industry contains an interesting note on the mission of the carp as an eradicator of the fluke disease. He writes:

There have been a number of suggestions made in regard to methods of prevention of liver-fluke disease (distomatosis), and some of them, especially the free use of salt, appear to be valuable. Mr. William Ashmead, of the United States National Museum upon returning from the Hawaiian Islands, told of a method which had been tried there with good results, namely, the introduction of frogs and toads into infected districts to devour the snails, which act as intermediate hosts. This method is entirely new to me, and appears to be a good one.

Dr. Ernest N. Hutchinson, an inspector of this Bureau, stationed at Portland, Ore., has recently called my attention to a decrease in liver-fluke disease following the introduction of carp into an infected district. These interesting notes by Dr. Hutchinson are worthy of serious attention, and, as Dr. Evermann, ichthyologist of the United States Fish Commission, has recently expressed it, they "justify us in scoring one more for that much maligned but exceedingly useful fish." Dr. Hutchinson writes:

I desire to acquaint you with some peculiar points concerning Fasciola hepatica which prevail in the minds of stock-raisers pasturing on the Columbia River bottom, and to which you may be able to attach some practical significance.

Prof. C. V. Piper, of the Washington Agricultural College, in conversation with me, mentioned the theory which I find is, as he said, extant in the minds of many farmers along this river, namely, that "leeches" (liver flukes), which were formerly numerous in the livers of cattle and sheep, have to a considerable extent disappeared since the introduction of carp into the waters of this river.

While of course the farmers' idea is that the carp now consume the leech, which, according to their view, the cattle formerly swallowed with the water while drinking, it is possible that there may be a practical connection between certain peculiar habits of this fish and the noticeable freedom from fascioliasis among the cattle and sheep ranged on the bottoms adjoining streams in which these fish are found, compared with animals coming from other sections where carp are unknown. About 75 per cent. of the cattle and sheep coming from the western slope of the Cascades, exclusive of this Columbia River bottom, are infested with Fasciola hepatica; but from this particular portion only about 5 per cent. are so infested.

All the bottom lands of this river are subject to annual overflow, and at this time the carp clean the meadows as thoroughly as a fire. Every spear of grass, up to the very water's edge will be eaten by them. They also have a habit of rooting all around the edge of this overflow as it gradually recedes.

It has occurred to me, therefore, as possible that they destroy the final cystic stage of this parasite with the grass, and perhaps in their rooting they may also destroy some of the snails.—Letter dated Dec. 2, 1901.

Replying to your letter No. 4092, of the 16th ultimo, I have to inform you that inquiries addressed to certain small butchering establishments whose main source of supply would be lands adjoining carp-bearing streams, to ascertain the frequenoy with which they encounter the liver fluke, has failed to secure a single reply.

The carp were introduced into the waters of the Willamette River at Portland, Ore., about eight years ago. They have multiplied very rapidly, and are quite numerous in the lakes and sloughs adjoining the lower Willamette and Columbia rivers. They have not, however, gone upward in these streams more than a few miles, seeming to prefer sluggish waters and stagnant sloughs.

Mr. A. E. Gebhart, secretary of the Oregon Fish Commission, in describing their feeding habits, likens them to the hog, saying they will eat anything that is eatable in the way of vegetation along the edges of sloughs and on the meadows at the time of overflow. They also root about in search of roots and such animal life as may be within their reach. He also says they will eat clams, as he has tried them as bait.

I am able to say that fascioliasis is much less common in animals from the lower Columbia and Willamette slough lands than from any other swampy districts of Oregon or Washington.—Letter dated Jan. 4, 1902.

Referring to correspondence No. 4092, I have to report to you that while at Ridgefield, Wash., on the 17th instant, I was able to confirm somewhat the theory that the carp in the waters of streams, reduce the dangers of fascioliasis in sheep. Mr. J. B. Campbell, for whom I inspected sheep for passage into Oregon, states positively that since the introduction of carp the flukes have entirely disappeared, and are no longer found in sheep pasturing on the bottoms, but that they are to be found as commonly as ever in sheep which feed upon the moist uplands.

As Mr. Campbell informed me that he had lost 30 sheep from some mysterious disease, and that other sheep owners in his vicinity had also lost many, I endeavored to find a cause for this mortality. I made post-mortem examinations of three sheep from as many different bands, each individual showing a marked degree of cachexia aquosa, with no acute inflammation of any organ The musculature was pale, flabby and watery. The retroperitoneal connective tissue was saturated with a semi-gelatinous, clear, transparent material. A considerable collection of this semi-fluid substance followed the attachment of the mesentery and the intestine. The blood was palish, and while of a quite clear red when discharged from the vessels, it did not make a marked stain upon the white clothing with which it came in contact. Great numbers of the Strongylus filaria were present in the lungs, and much of the lung tissue was collapsed and in a state of carnification, particularly the ventral border and caudal third of the principal lobes. Strongylus contortus was also very numerous in the fourth stomach, the submucosa of which was the site of the same clear, semi-gelatinous infiltration.

These animals had pastured continually upon the low bottom lands, and were entirely free from Fasciola hepatica.—Letter dated Feb. 20, 1902.

In corresponding with the United States Fish Commission on the subject, the following letter has been received from Dr. Evermann:

Your letter regarding the carp is very interesting, and it justifies us in scoring one more for that much maligned but exceedingly useful fish.

I do not know of any observations which have been made specially for the purpose of determining whether the carp feeds upon Limnæ [swamp snails which serve as intermediate host of Fasciola hepatica], but there is no doubt in my own mind but that it does so. Carp will feed freely upon all sorts of small mollusks and crustaceans which it finds in the water, and when carp are able to go out in overflow ponds they will certainly clean up everything edible in the way of animal and plant material. I would be very glad to know more of this matter. Can you give me the localities to which you refer, and any more details?—Letter dated Dec. 11, 1901.

The action of the carp in this case appears to be very strongly supported by the facts stated, and it seems that the introduction of carp into fluke districts generally would result in a great decrease of liver-fluke disease.

Lakes Perpetually Ice-Covered.

Two lakes covered with ice all the year round have been discovered in Baker County, Ore., according to the Portland Oregonian. C. M. Sage, with a party of friends, went on a hunting and pleasure trip to the almost inaccessible mountain peaks back of the town of Cornucopia, in the Pan-Handle district. The mountains are high and rugged, and before passing the timber line the explorer must find his way through a primeval forest. A pack horse is the only means of getting into this district, except to trudge along on foot, which, to

say the least, is uphill business. One part of the road is so incumbered with fallen trees that it is almost impossible to get through. In order to get supplies to their claims two prospectors were obliged to cut a trail through this tangle of fallen trees, and it was by means of this trail that Sage and his friends were enabled to ascend the mountains until they finally discovered the two frozen lakes referred to. The lakes are near the summit on the north side of the mountain, and in order to reach them the party traveled over ice and snow for a distance of five miles. The bodies of water are small. One is about 150 feet across and the other is between 600 and 700 feet in diameter. They are well-defined lakes or pools, however, covered with a thick coating of ice, clear as crystal, and as smooth as glass, which is so thick and strong that the exploring party did not hesitate to ride across on horseback. Sage says, so far as he is able to judge, the ice on the lakes never melts because they are so situated behind two tall peaks that the sun's rays never strike them with sufficient power to make any impression on the snow and ice. This land of perpetual snow and ice is within a day's ride of Baker City by the present means of transportation, part way on a buckboard and the rest on horseback. It would scarcely be more than a ride of an hour and a half on an electric railroad. Sage is of the opinion that from the lay of the country other large and more pisturesque lakes with perpetual ice will be discovered.

Black Bass in Rhode Island.

THE Rhode Island Commissioners of Inland Fisheries report that the restocking of ponds and streams with the large-mouth black bass has been attended with gratifying success. In all waters in which they have been placed the results have amply repaid the small outlay. Pawcatuck River, from Niantic Dam to tide water, now affords good fishing, where formerly it produced no food fishes of any practical value. During the past season it has been the rule rather than the exception for the mill hand to make a catch of several of these fish after finishing his day's work.

Through the courtesy of the United States Fish Commission, a consignment of 300 yearlings, averaging five inches in length, were received in November, 1901, and placed in the preserve near Wood River Junction, for the future use of the Rhode Island Commission in restocking other waters.

The Commission received, on Nov. 13, 1901, from the United States Fish Commission, another consignment of 250. These were planted in Quidnick reservoir, and in Skinflint and Hospital ponds. The Commissioners believe that the large-mouth and small-mouth black bass are steadily growing in favor as an edible fish, as well as a game fish, and expect soon to be able from their own resources to plant both kinds in the waters of the State not already stocked, which are suited to them.

A Government Handbook of Flies.

PROBABLY for the first time in the history of the world a government department has issued a "Handbook of Artificial Flies for Salmon and Trout." I have received from the Fisheries Branch of the Department of Agriculture and Technical Instruction a copy of the recently published "Handbook of Artificial Flies for Salmon and Trout, as Used in the Different Fishery Districts of Ireland, with a Map of the Fishery Districts." It appears that there has been an international exhibition at Cork, and that the Irish Fisheries Department had a collection of Irish salmon and trout flies, and this handbook was prepared to illustrate the collection, or was the collection prepared to illustrate the handbook? Anyway, it does not matter, and I welcome this angling work, "printed for His Majesty's Stationery Office," as infinitely more interesting and useful than most of the blue books on fisheries which appear with His Majesty's sanction.

In a prefatory note we are informed that the flies in the collection have been recommended to the Department by experienced anglers having special knowledge of the several districts. The information as to locality, season and names of makers was obtained in the same way. "The Department, however, while satisfied of its accuracy as far as it goes, can, of course, take no responsibility that it is complete in any particular," and, it adds rather slyly, "It will be noticed that flies known by the same name are often very differently dressed in different districts. As a rule, the salmon flies in the exhibit are tied upon the hooks of medium size, while, in order to display the dressing to the best advantage, the trout flies are shown on the largest size of hook used for the pattern." It is quite refreshing to find a Government department talking in this sensible and technical way about the arcana of angling, and the handbook itself shows in four columns the name of river, kind of fish, local and standard patterns of flies used and their times and season; it even goes so far, in some few cases, as to give dry-fly patterns. It is a very useful, though of course not complete, list, and I shall get my copy bound in morocco for reference. Some day it will be the scarcest of angling books—the only one ever published by the British Government.—R. B. Marston in London Fishing Gazette.

A Record Muscalonge.

MR. CHARLES HALLOCK sends us the photograph of a muscalonge caught in the St. Lawrence River near Clayton, N. Y., in September of 1879, by Capt. Jas. Millward

and John B. Spofford. The length was 4 feet 8 inches, "the largest of the kind ever taken on a troll" up to that time.

Charm Oil.

FALL RIVER, Mass.—*Editor Forest and Stream:* I have in my employ an Englishman who is an enthusiastic salt-water fisherman. Years ago he was in the habit of going fishing with an elderly man who used on his bait a yellow oily liquid with a strong odor resembling that of geranium leaves. When fishing with this man, he claims, big catches were always made; but as the old gentleman refused to tell of what the liquid was composed, the secret died with him. My curiosity being excited, I visited a large wholesale druggist to see if they knew of such a thing as charm oil. My visit was not in vain. A French-Canadian had preceded me by some months, and by his persistence in searching for the liquid, had at last caused them to bestir themselves. They visited a French druggist in the French quarter of the city, and were by him put on the right track. The following is the formula:

Oil rhudal ..... 1 part
Oil copbia ..... 20 parts

In the book of drugs it was described as a lure for foxes and rats, also as good for fishing, to be used on the baits. I have never used any of the liquid myself, but wondered if it was known to the readers of FOREST AND STREAM. S. EVERETT.

[Oil of rhodium is obtained from a species of rose, is a well-known scent which is in common use among trappers.]

Nov. 11.—St. Joachim, Ont.—International Field Trial Club's fourteenth annual trials. W. B. Wells, Hon. Sec'y.
Nov. 17.—Glasgow, Ky.—Third annual trials of the Kentucky Field Trial Club. S. B. Hays, Sec'y.
Nov. 18.—Branchton, Pa.—Central Beagle Club's seventh annual trials. A. C. Peterson, Sec'y.
Nov. 18.—Ruthven, Ont.—Fourth annual trials of the North American Field Trial Club. Alfred Wigle, Sec'y, Windsor, Ont.
Nov. 24.—Glasgow, Ky.—American Championship Field Trial Association's second annual trials. C. B. Cooke, Sec'y.
Nov. 29.—Thomasville, N. C.—Continental Field Trial Club's eighth annual trials.
Dec. 1.—Washington C. H., Ohio.—American Championship Field Trial Club's second annual trials. Chas. B. Cooke, Sec'y, Richmond, Va.
Dec. 15.—Huntsville, Ala.—Alabama Field Trial Club's (member of the American Championship Club) third annual trials. John F. Fletcher, Sec'y, Birmingham, Ala.

Canine Elegies and Epitaphs.

XXV.—A Friend.

"Ci-git qui fut toujours sensible, doux, fidèle,
Et, jusques au tombeau, des amis le modèle.
Il ne me quitte pas quand je perdis mon bien.
—C'était un homme unique!—Helas! c'était mon chien."
—Epitaphe d'un Ami, par Edmond Dallier.

[Here lies one who was always sensible, sweet and true, and even to the tomb a model friend. He never deserted me, not even when I lost my wealth. He was an unique man! Alas, it was my dog.]

Two More Dogs of Worth.

Editor Forest and Stream:

In your issue of Sept. 20 Dr. Samsell has given an interesting history of his little dog pup. There were two dogs in Idaho that certainly deserve a niche in the halls of fame, and I hope you will find their story too interesting to throw into the waste basket.

Quite a number of the miners used to work in Warrens all summer; then they would go out to the South Fork of a salmon river and rock all winter. They were of a whole-souled class; whatever one had all were welcome to, and if anything happened to one all were ready to go to his relief, no matter what the danger was. In the fall of which I write, Pete Smith had gone over along in the later part of November, it was twenty miles, and over one divide, where the snow was about eighteen inches deep.

The South Fork was an ideal place to winter; game was plentiful; there were deer, sheep and elk, for big game, and grouse and pheasants, as well as plenty of the mountain rabbits for small game; and the horses turned out on the range would come out fat in the spring. Miners could make from $4 to $5 per day when they would work.

Pete had been in camp about a week. One day he was taken very sick and he thought that his time had come, and that as there was no one in less than twenty miles of him, that he would die. His companion was Rover, a dog. Just a dog. I cannot give his correct pedigree, but it was heaviest on the shepherd side, and his color was a grisly "yaller." His disposition was good, and there was not a man, woman or child in Warrens did not like Rover.

Although Rover wos a good companion, Pete thought that he could be of very little service to him in his great pain. After the first paroxisms of pain had ceased, Pete thought he would try and send Rover for assistance. He got up and wrote a note and tied it to Rover's neck, and after caressing him for a little while opened the door and let him out, in hopes the dog would go to Warrens. Then he lay down again, and it was not long before he felt a little better and was able to go out of doors and take a look up the mountain trail, but Rover was nowhere to be seen.

About two, or perhaps three, hours afterward, as Joe Debuc was coming out of the slaughter house, which was about a half mile out on the trail, he saw Rover coming as fast as he could run. Joe thought that Pete was near and would soon come in sight. Rover run to Joe and reared up on him, and Joe saw the letter hanging by the string. He opened it, and as soon as he read its contents he hurried to town and reported. Joe had hard work to keep Rover from going back. Joe told him to wait till they could saddle their horses and they would go with him. Joe went to the drug store and told Doc Sears, who immediately saddled his horse, and in less than a quarter of an hour there were four men on the road back with Rover, who had to follow as the horses could travel faster than he could in the deep snow. But when they got out of the timber and started down the mountain to the river and out of the snow, Rover left them and made a run for the cabin. When Pete heard him he opened the door, and when Rover found his master able to get up, it was pathetic to see the antics the dog cut; he would bark, then howl, then whine, and lick Pete's hands and manifest his delight by all kinds of tricks. Soon the boys rode up, and Rover was as glad to see them as was Pete. They were glad to find Pete over his spell. They turned their horses loose and it was not long before they had a miners' supper, and all were happy, but none more so than was Rover. The next day the boys returned, and Rover looked very downcast when they left.

The next spring Pete sold Rover to Ike Grostien and he after a while let Dave Baldwin have him, and I think that Rover died Dave's.

Our next dog was the property of August Berg, a German, who resided on the main Salmon River, and owned a cattle ranch as well as a garden spot and small orchard. Berg had been there for a long time and had sold lots of cattle and was thought to have lots of money. When the first Chinamen were allowed to come into this district Berg hired one for a cook, and he has been with him for at least fifteen years, and Berg's confidence in Lee was explicit. Often Berg would be gone for several weeks, and Lee would take good care of everything on the place, and if he received any money for produce he would turn it over to Berg on his return. During the time that Lee lived with Berg, Berg brought home a shepherd pup from

old Uncle Johnny Woods, and Lee took great pains in raising the little dog, which soon got big enough to go with him for the cows, and proved to be very watchful.

The dog had got to be about two years old when, one day, the Chinamen, who had ground his hatchet very sharp, made an assault on Berg, intending to murder him for his money. The first strike he made Berg threw up his right hand and the hatchet cut the thumb off, the next stroke split the hand. The dog was near and he grabbed the Chinaman by the calf of the leg, and his attack on the Chinaman was so fierce that the Chinaman had to quit Berg and turn on the dog, who dodged his blows. Berg's ear was nearly severed from his head, but he ran when the Chinaman turned on the dog. As soon as the Chinaman found Berg had escaped he left the house and started up the trail toward Florence, which was twelve miles away.

After the Chinaman left Berg went into the house and bound up his wounds best he could, and it was not long before the expressman came by, and he went down on to the river, about four miles, and told the miners what had happened. It was not long before there was a big crowd, and as soon as they could get their horses ten of them started for Florence to get Lee. They found his tracks in the trail, but he had got to Florence ahead of them. There were at that time about 150 Chinamen in the camp, and it was known that the Chinaman would be secreted. When they got to camp they asked the Chinese boss if Lee had come. He said he "no see him," and he thought "maybe he gone to Lewiston." The boys made a house to house hunt, and finally found Lee in between two beds. They pulled him out and found his legs badly bitten. They locked the Chinaman up, as it was too late to start to Warrens, which was the nearest place where there was a justice of the peace. They told the China boss that they would take Lee and turn him over to the civil authorities at Warrens. Next morning early they left [illegible] when they got down to the wire bridge they [illegible]ee to the center of the bridge, which is sixty [illegible]e the water; then they went over to Cary's [illegible]d for a couple of hours; then they cut the [illegible]let Lee go down the river; after which they [illegible]o camp, having done a good deed.

[illegible]xt year Lang and Ryan came up to Camas Prairie to buy cattle and Berg brought over a couple of hundred head and turned them over to Lang and Ryan, who were camped at Crook's Corral, where they were receiving cattle every day. Having some steers out and not wanting them to follow the drove off, I was putting in several days at the corral. One morning, before any cattle came in, some of the boys got Matt Ryan to try and buy Berg's dog. There must have been at least forty men standing around. Matt said to Berg, "What will you take for that dog?"

"I don't vant to sell dat dog," Berg replied.

"Oh, that is not what I asked you. I asked you what you would take for him?"

"Vell, I vuddent sell dat dog."

"I will give you $500 for him."

Berg straightened up and said with much passion: "Matt Ryan, you and your fadder hain't got money enough to puy dat dog. For if it haddent peen for dat dog, Old Perg vuddent peen here now, and as long as dat dog lives I vill keep him mit me, and if he ties first I will purry him."

The faithful dog was lying down by his master and knew he was the subject under discussion, and he would roll up his eyes, but when Berg emphasized his remarks [illegible]vagged about a foot of the end of his tail, as [illegible] to say, "You may buy all the cattle there are [illegible]ountry, but you can't touch me."

[illegible] well known that Ryan and Lang had bought [illegible]ree States of Idaho, Washington and Oregon [illegible],000 head of cattle. So you see there was one man, although he had the reputation of being penurious, had too much kind feeling to part with the best friend man ever had among the brute creation.

LEW WILMOT.

KELLER, Wash., Oct 2.

Pointer Club of America.

NEW YORK, Oct. 18.—The following are the entries for the third annual field trials of the Pointer Club of America to be held at Eastport, L. I., commencing Nov. 6. The Members' Stake closes before starting, and is therefore incomplete.

C. F. LEWIS, Sec.-Treas.

DERBY STAKE.

Dr. Allen Fitch's Fair Acre Cero, l. and w. bitch.

Cyrus P. Wilcox's ——.

George S. Mott's Old Glory II., l. and w. dog (Mott's Regent—Kida).

George S. Mott's Young Lad of Kent, l. and w. dog (Lad of Kent—King's Daughter II.).

George Jarvis' Jess of Kent, l. and w. bitch (Sambo—Ruth of Kent).

Wilcox & Fairbairn's Fair Acre Hector, l., w. and t. dog (Fair Acre Fatal—Vandel a II.).

A. H. Ball's Top Notch Launcelot, l. and w. dog (No. 68962).

MEMBERS' STAKE.

Dr. Allen Fitch's Kent V., l. and w. dog.

Dr. A. G. Terrill's Belle of Kent III., l., w. and t. bitch (Dean of Kent—Gypsy Beaufort).

Dr. James S. Howe's Baby Kent, l. and w. dog (Duke of Kent—Queenie).

Randolph Crompton's Dan Woodstock, l. and w. dog (Plain Sam—Folly).

Walton Ferguson, Jr.'s, Frederica, l. and w. bitch.

Wm. M. Howell's Sister, l., w. and t. bitch (Prince Regent—Mischief Nell).

Brookdale Pointer Kennels' Dream of Brookdale, bl., w. and t. dog (Roland—Brookdale Lilly).

W. W. Davenport's Fairview Folly, l., w. and t. bitch (Fairview Pream—Lady Bessie).

H. B. Rathbone's Top Notch Nibs, bl. and w. dog (Silver Socks—Bessie Ford).

A. H. Ball's Top Notch Rock, l. and w. dog (Ray I.—Susie Bracket).

ALL-AGE STAKE.

Henry W. Terry's Teddy B., l. and w. dog (Clip—Diana K.).

Henry W. Terry's Merry Girl, l. and w. bitch (Teddy B.—King's Daughter II.).

Dr. Allen Fitch's Prince's Lad's Lassie, l. and w. bitch.

Dr. James S. Howe's Baby Kent, l., w. and t. dog (Duke of Kent II.—Queenie).

Randolph Crompton's Dan Woodstock, l. and w. dog (Plain Sam—Folly).

Walton Ferguson, Jr.'s, St. Kilda, l. and w. bitch.

Walton Ferguson, Jr.'s, Frederica, l. and w. bitch.

Brookdale Pointer Kennels' Dream of Brookdale, b., w. and t. dog (Roland—Brookdale Lilly).

Philip W. Moen's Brodick Dash, l. and w. dog (Heather James—Heather Gem).

Charles Caster's Fred C., l. and w. dog (Prince's Lad—Leah).

Charles Caster's Grenadier, l. and w. dog (Prince's Lad—Nell).

W. W. Davenport's Fairview Folly, l., w. and t. bitch (Fairview Pream—Lady Bessie).

H. B. Rathbone's Top Notch Nibs, bl. and w. dog (Silver Socks—Bessie Ford).

A. H. Ball's Top Notch Tobie, bl. and w. dog (No. 65674).

CHAMPIONSHIP STAKE.

Henry W. Terry's Merry Girl, l. and w. bitch (Teddy B.—King's Daughter II.).

Henry W. Terry's Teddy B., l. and w. dog (Clip—Diana K.).

Walton Ferguson, Jr.'s, St. Kilda, l. and w. bitch.

Walton Ferguson, Jr.'s, Frederica, l. and w. bitch.

W. P. Austin's Brimstone, bl. and w. dog (Ripstone—Tick).

Philip W. Moen's Brodick Dash, l. and w. dog (Heather James—Heather Gem).

Frank E. Norton's Duke, or., w. and t. dog (Sport—Birdie).

Charles Caster's Grenadier, l. and w. dog (Prince's Lad—Nell).

W. W. Davenport's Fairview Folly, l., w. and t. bitch (Fairview Pream—Lady Bessie).

Charles Caster's Fred C., l. and w. dog (Prince's Lad—Leah).

Treat Your Dog Well.

We love to hear a man praise the fine qualities, blood and training of his dog, but we hate to see him turn around, yell at and kick the faithful brute to make him down charge. Training makes perfect dogs. We do not believe that a man that will kick his dog for every little mistake, or to make him mind, ought to own one. A dog is not trained perfectly in one lesson. This fact ought not to be lost sight of by some men with whom we are acquainted. Many a dog will act beautifully at home after a few lessons, but will be too nervous to show off before a crowd. Failure to act promptly on his first exhibition does not warrant his being abused. The dog is the truest and most faithful friend of man and should be treated as such.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1902, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, $50.00.

Second prize, $30.00.

Third prize, $20.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1902.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. An outline chart suitable for reproduction, showing the course taken, must accompany each article. When possible, articles should be accompanied by amateur photographs taken on the cruise, including one of the boat. Good photographs will be considered in making the awards.

5. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York city, on or before Nov. 15, 1902.

Mr. T. C. Zerega has very kindly consented to act as judge and to make the awards.

There is now building at the Townsend & Downey Shipbuilding Company, Shooter's Island, from designs made by Messrs. Cary Smith & Barbey, a steel auxiliary cruising schooner for Mr. John M. Masury, of New York city. The yacht will be 120ft. over all, 90ft. waterline, 23ft. 4in. breadth and 14ft. draft.

Lipton's Challenge Accepted.

SIR THOMAS LIPTON'S third challenge for the America's Cup was sent by the steamer Oceanic and was delivered at the New York Y. C. on Wednesday afternoon, Oct. 15. A special meeting of the club was held on the following Thursday night to consider the challenge. A large number of members attended the meeting. Vice-Commodore Frederick G. Bourne presided in the absence of Commodore Ledyard, who is quite seriously ill. The meeting was not a long one, for the challenge and some letters that passed between Sir Thomas Lipton and officers of the club were soon read.

Commodore Ledyard, Vice-Commodore Bourne, Secretary Cormack and Messrs. E. D. Morgan, E. M. Brown, J. Pierpont Morgan, J. Malcom Forbes, Archibald Rogers and W. B. Duncan, Jr., made up the committee on the challenge. This committee held its own meeting directly after the general meeting and formally accepted the challenge.

Secretary Cormack sent a cable to Sir Thomas Lipton and Mr. Hugh C. Kelly, of the Royal Ulster Y. C. as soon as the meeting adjourned that the challenge had been accepted. The cablegram read as follows:

HUGH C. KELLY, Secretary Royal Y. C., Belfast.

Challenge accepted. Same conditions as prevailed last races.

CORMACK, Secretary.

Sir Thomas Lipton was sent the same cablegram.

The following correspondence was given out by Secretary Cormack after the meeting:

Royal Ulster Y. C.,
Mountpottinger Road,
Belfast, Oct. 7, 1902.

G. A. Cormack, Esq., Secretary, New York Y. C., New York:

Dear Sir: I am requested by Sir Thomas J. Lipton, Bart., K. C. V. O., to forward you this challenge for the America's Cup, subject to the same conditions as governed the last contest and which proved to be so satisfactory, namely, the best three out of five races over the same courses with like starts and other details.

The first race to be sailed on Thursday, Aug. 20, 1903.

The second race to be sailed on Saturday, Aug. 22, 1903.

The third race to be sailed on Tuesday, Aug. 25, 1903.

Further races (if any) to be sailed on each following Thursday, Saturday and Tuesday, until finished.

I, therefore, on behalf of the Royal Ulster Y. C., and in the name of Sir Thomas J. Lipton, a member of the club, challenge to sail a series of matches with the yacht Shamrock III. against any one yacht or vessel constructed in the United States of America for the America's Cup.

The following are the particulars of the challenging vessel, viz: Owner, Sir Thomas J. Lipton, Bart., K. C. V. O.; name of yacht, Shamrock III.; length on load waterline, 90ft.; rig, cutter.

The Custom House measurement will follow as soon as the vessel can be measured for registration.

I shall be much obliged if you will cable the receipt of this challenge.

Hugh C. Kelly,
Honorary Secretary,
Royal Ulster Y. C.

Mr. Cormack received the following letter in the same mail that brought the challenge:

Osidge, Southgate, Middlesex,
Oct. 7, 1902.

Dear Mr. Cormack: You will receive by the same mail a communication from the secretary of the Royal Ulster Y. C. conveying a challenge on my behalf for a series of races for the America's Cup to take place next year.

In view of the eminently satisfactory and complete arrangements made by your club for the two contests in which I have already been privileged to engage, I ask, as you will see from the terms of the challenge, no change whatever in the conditions which governed the last contest entered into by me.

In thus desiring an opportunity of making a third attempt to obtain possession of the America's Cup, I hope I may not be deemed importune or unduly covetous of the precious trophy so long and so securely held in trust by the New York Y. C. Yours faithfully,

Thomas J. Lipton.

G. A. Cormack, Esq., Secretary New York Y. C., New York.

Last spring the New York Y. C. discussed the advisability of changing its present measurement rule. At this time Sir Thomas Lipton wrote Commodore Ledyard as to its effect on the boats that raced for the America's Cup. The letters that passed between these two gentlemen follow:

City Road, London, E. C.,
May 2, 1902.

My Dear Commodore: With reference to the reports which have recently appeared in the press concerning a suggested change in the measurement rules of the New York Y. C., there is at present considerable speculation in yachting circles here as to whether such change is likely to be made, and if made, whether it would apply to the contests for the America's Cup.

The prevailing idea is that in view of the great doubt which exists as to whether or not the rules will be altered, and the consequent uncertainty as to the type of boat with which it would be necessary to challenge, and also of the fact that for a contest in 1903 the design of the challenger would require to be commenced shortly, no one would under the circumstances care to consider the advisability of challenging for next year.

I should like much if you could throw any light on the matter and especially advise me whether, in the event of the club deciding to change the rules, such change would apply to the America's Cup races.

Should you prefer that this letter be answered officially

by the club, you might kindly just hand it over to the secretary.

I hope you are keeping well.

With kind regards, yours faithfully,

Thomas J. Lipton.

Commodore S. Cass Ledyard, New York Y. C., New York.

New York Y. C.,
37 West Forty-fourth Street,
New York, July 8, 1902.

My Dear Sir Thomas: Your letter of May 2, inquiring whether in the event of a change in the New York Y. C.'s measurement rules, such change would apply to the America's Cup races, has remained uanswered until now because of my illness and other reasons, having no relation to its subject, as I have explained to you in a personal letter,

The point raised by you is an important one, and I quite agree with you that it should be answered by the club officially. I therefore submitted your letter to the club and am authorized by it to send you this reply:

The facts about the proposed changes in the rule are that some months ago a committee was appointed by the club to obtain the views of the leading designers in the United States and England and other countries as to the desirability of adopting some rule of measurement which would tend to evolve a more satisfactory and wholesome type of vessel than has been produced under the operation of our present rule. It was expected that the work of this committee would not be completed until nevt autumn or winter, and such is now likely to be the case.

I need not say to you that the step taken had no relation to any contest for the America's Cup in 1903, for it was not deemed possible that any change in the rules which might be brought about by it could become effective until long after the expiration of the limit of time for giving notice of a contest for that season, and no one could maintain for a moment that any change in its rules made by the challenged club after the receipt of a challenge could affect the race to be sailed near such challenge.

Nor, indeed, would the New York Y. C. be willing, even if it had the power, by any change in its rules, to shut out or prejudice or handicap in any respect any challenging yacht built in reliance upon its existing rules. If any change in its rules could injuriously affect a challenger, the club would regard itself as imperatively bound to make such change known in ample season to prevent injustice or prejudice.

Therefore, you may rest assured that, if you desire to challenge through any club for 1903, no change in its rules by the New York Y. C., whether made before or after the receipt of a challenge, would apply in any degree to the contest under such challenge.

The fact, however, that you have asked the question makes it proper for me to observe further, that under the deed of gift no such question can really arise.

As I had occasion to explain to you when the question of towing arose in connection with the challenge of Shamrock I., the deed of gift prescribes no conditions respecting the kind of vessel which may compete, except (a) that she shall be within certain limits of length; (b) that no dimensions stated in the certificate may be exceeded; (c) that no restriction shall be placed on centerboards, and, lastly, that she shall proceed under sail, on her own bottom, to the port of contest. This last condition imports all that the framers deemed wise to insert by way of limitation upon the type of vessel, viz., her actual and demonstrated ability to make the passage under sail.

As to measurement, the deed makes no provision whatever. That is left to be dealt with under the mutual agreement clause. The two clubs may agree upon any system of measurement they please. If they fail to agree, the terms of the match are prescribed by the deed; best two out of three races on ocean courses as described, "subject to the rules and sailing regulations" of the challenged club "so far as the same do not conflict with the provisions of the deed, but without any time allowance whatever."

You will observe that under this provision the New York Y. C. would have no power to make any change in its measurement rules apply to a challenging yacht without the consent of the club to which she belongs. All that the challenger would have to do would be to appeal to the deed and stand upon his right to sail the race, boat for boat, without any time allowance whatever, and, therefore, without the application of any rule of measurement. Indeed, the New York Y. C., as the holder of the Cup, regards it as quite beyond its power to impose any restriction or any hindrance upon the challenging yacht, beyond those above enumerated as specified in the deed. The enumeration of these qualifications by the deed excludes the idea that the challenged club could in any way vary from or add to them.

Any yacht, properly challenging through a qualified club, of a waterline length within the limits specified, complying with the deed as to notice and certificate, and proceeding under sail on her own bottom to the port of contest, is entitled to sail for the Cup, on the courses designated, best two out of three, boat for boat, without time allowance and without any other or additional restrictions being imposed upon her. She must sail, it is true, under the rules and sailing regulations of the challenged club, but any provisions of these would plainly conflict with the deed, if they operated to impose any other limit, condition or penalty upon type, model, sail area, or other factor going to the qualification of the challenger.

I have been thus at pains to state our position on this subject, in order the more effectively to allay any anxiety that may naturally have been caused you by the newspaper reports to which you refer. We certainly do not intend to make any changes in our rule of measurement apply to the America's Cup races, and if we had any such intention, it is perfectly plain that we should be without power to make it effectual.

Since you suggested that our reply should be an official one, I would be greatly obliged if you would cause this letter to be laid before the Royal Ulster Y. C., that it may be informed of its contents. Very truly yours,

Lewis Cass Ledyard, Commodore.

Sir Thomas J. Lipton.

Seventeen Days' Cruise on Long Island Sound.

BY THE CREW, THE SKIPPER AND THE OWNER.

(Concluded from last week)

Dead ahead were a number of docks and a little shelter. It was here we decided to drop the hook, and with a plunge and a smash the Innocent lay over as the Skipper brought her up in the wind. No time for losing headway or letting anchor go easily; she would have been away from us in a wink. Orders could hardly be heard, so leaping forward the Skipper let go the anchor, at the same time hauling down jib; the throat and peak halliards, for a wonder, were not jammed, and we got the mainsail off her handily. The way she took that 200ft. of ⅜ chain was a caution, but when it snubbed up to the bitts, the Skipper said "Let her blow." And the Bartender piped to a glass of grog, and we took stock of our surroundings. The Skipper supposed we were in Napeague Bay, but it was mere guesswork. The peculiar configuration of the land had shut us in completely; we had no lights to go by and seemed to be in a landlocked bay, with the ocean immediately on the other side of us. The Skipper fancied he could hear the pounding of the surf on the beach. Going ashore we found we had struck the Promised Land, an exceedingly unapropos name for such an ill-favored spot of country. The air was redolent with a peculiar sickening smell, which we found came from decaying fish oil, which is manufactured at this place. The beach was covered with a peculiar grass and with small brush. A few dilapidated huts and a company store were the only apparent dwelling houses in the vicinity. The only people we could find were either Huns, Slovaks or Poles—

hard to tell which—who jabbered at us in their dialect. The one American who had charge of the company store was a silent man, who answered our questions monosyllabically. Perhaps the sparseness of the surroundings had soured his temper. We bought a small quantity of butter, which was fair in quality, and some bacon, but nothing else could we get, except the average canned stuff, of which we had plenty aboard. We walked back to the boat and found it was blowing harder than ever; it was evidently a case of stay in this harbor until the blow was over. So we went aboard, cooked a sumptuous supper of steak, potatoes, asparagus tips, corn, string beans, with English plum pudding, beer and coffee on the side, after which the Skipper studied the chart; but as the buoys at Promised Land did not seem to correspond with those on the chart, he decided to wait until morning, when he would go ashore and try to get his bearings. The wind had now hauled a point to the south'ard, and the height of land gave us a little more shelter, so we put up our riding light, feeling that our anchor would hold, no matter how it blew. We turned in; shut the cabin door to keep out the sickening smell of the fish oil, smoked a cigar—or rather cigars—and gradually felt the drowsy influence of the god who wooes the tired sailors of the f'csle with the same earnestness as those of the quarterdeck, and, with the wind blowing a gale and the little boat 'scending and tossing, a somewhat vigorous rocking, our little ship's company fell asleep.

Aug. 7.—Still blowing a gale from the east'ard. Banked up on the horizon, north, south, east, west, rolls of thick, low-hanging, gray clouds, so low in the heavens that one can almost note their formation. The tide running out like a mill race, and we have evidently anchored in a peculiar spot. The seas never break around us; indeed, it is always comparatively smooth; but there is not enough strength in the breeze to overcome that rushing tide effectually. We had no trysail aboard, or the Skipper would have hoisted it; our awning would have been torn to atoms in a moment; and we kept describing arcs of a circle around our anchor. We got another anchor out on deck and 200ft. of cable in readiness should we start to drag. And thus, watching our chain and waiting, the morning hours drifted by. We had breakfasted lightly; the smell was getting in its fine work, and the Owner had already paid tribute to its efficacy. It was only by smoking countless cigars that the Skipper's stomach remained normal. The Crew was getting along fairly well. "A good chance to sleep," said he—and he slept. The monotony of our watch was broken by a small fishing sloop beating in, with scandalized mainsail; she made good weather of it under this sail; when they came about, a man forward would hoist a little of her jib, she would then come about; as soon as she filled on the other tack, down came jib; she worked handily this way, as well as a catboat; she ran up to the dock, off which we were anchored, and the Owner immediately set off in the dinghy to get compass directions and buy some fish. With his customary luck the Owner was in for it. It commenced to pour torrents; rain it could not be called. The scuppers in the cockpit did not carry the flood off quick enough; there was a full ¼-in. of water in an incredibly short time. This lasted for about half an hour, when it let up, and the Owner came back with fish and information. It was not much of either he brought; a scant half dozen butterfish and a small blue. He informed the Skipper he could have got more, weakfish, too, but he thought these few would be enough. Poor Owner! He little thought of the hungry Skipper and ravenous Crew aboard, only the flickering memory of a lost appetite was his monitor. The Skipper made a few remarks, and a scornful laugh laughed he. The only information the Owner could get (so he said) was "Keep close to the bushes." Of compass courses he spoke not; the yellow buoys were private buoys, but what for he did not know. "Keep close to the bushes"—the Skipper repeated this to himself, trying to get the meaning through his dumb skull. Going on deck with the glass he searched the four shores for "bushes," but no bushes were there. Turning in he again had the Owner repeat: "Keep close to the bushes." He was not quite sure whether he was going "queer." Gravely the Owner repeated his instruction. Again searching the horizon the Skipper suddenly had a great light dawn on him—the bushes were lashed to the buoys in order to make them more distinguishable, and with a "he haw ho" the Skipper and Owner decided to brave the gale and run to Shelter Island at once.

We tucked in all the reefs, and got a strain on the chain. It needed our entire ship's crew to heave it short. And then our wind'ass—a powerful one—did the rest. Exactly how this thing occurred no one will ever know, but the windlass brought up the anchor before it brought up the chain. The moment the anchor was brought to the surface the Crew had hoisted the jib, and away we went dragging the chain after us. Not for long, for she brought up in the wind and before we could get control of her we had drifted into one of the docks. We made her fast, and taking our jib halliard block from jib hoisted anchor and chain on deck, and a beautiful snarl it was in. It took us some time to clear it, and then we warped out beyond the shelter of the dock and away we went like a scared cat. We made good weather of it, and picked up our buoys without a grounding, and on rounding a black and red buoy we rapidly got our bearings. The wind had begun to favor us, was moderating to a one-reef breeze, and we decided to shake out two reefs. This was quickly done, and we commenced to log about six knots. We picked up Long Beach Light, stood a little to the eastward; picked up Inner Beach Light and stood in between the buoys for the breakwater at Greenport, which we made nicely. We dropped the hook at dusk in about 16ft. of water, and after supper the Crew and Skipper made a flying visit ashore for provisions and ice, and to send telegrams to Owner's and Skipper's respective families, after which we turned in and lay dead till the morning.

Aug. 8.—Rise at 6; Cook under way. Quite a number standing out of harbor in company with us; as usual hold our own; one big, modern sloop gradually forging ahead of us. Quite a number of auxiliaries, cats, sloops and yawls were sailing along with sails set and "kicker" chug-chugging away. It is this abuse of the thing that the Skipper abhors. When you have wind use it. But if you must use power in a breeze, furl the sails. We stood through the gut with a nice breeze abeam and tide ebb, and one would never realize how nasty that Gut can be sometimes in comparison. Flattening sheets, we stood well across on our starboard tack, the ebb tide catching us and setting us down toward the Race; we made poor time bucking that tide. Orient Point Light was our companion for quite a while, but gradually we worked under the Long Island shore, and with a series of short boards made Horton's Point Light. It was now about 2 in the afternoon, and, as our intention had been to try for Port Jefferson, we hoped for more wind with the change of tide. And we got it. A mile or so to the southwestward of Horton's Point Light it came from the S.W. with a rush. It is almost incredible how a sea can pick up in such a short space of time. In less than 15 minutes the Sound was covered with little white caps. Hugging the Long Island shore we stood on and off, the Skipper driving her through the seas and making good time under the lee of the land. Occasionally a puff would hit and she would lay over and run up in the wind like a startled bird. It was in one of these puffs the Owner's nerves started again, and he wanted to reef, but the Skipper apparently paid no heed, and kept the Innocent going. Crack! away went her port backstay in one of the jumps. The Skipper still kept her sailing. It was getting late in the afternoon, and Port Jefferson was a long way off. The Sound by this time was full of those short, steep, angry seas with a broken crest on each of them. Invariably one would be under the Innocent's stem, while one was breaking under her stern. We were close hauled and she was driving through it, but if our destination had been across the wind a point or two we would have made better weather. Threshing to windward in a sea is always a wet task for a small boat, and we were only a little fellow. In response to the Owner's urgent and sensible request to reef, the Skipper relinquished the stick and got a reef in the mainsail. By this time the shelter we had got from working along the weather shore of Long Island was gone, for in reefing we had let her run across and were now in the open, and it was choppy-chop-choppy. It was the first time during the cruise that darkness had caught us in her somber pall before making a harbor, and the situation to one whose nerves were on edge was, perhaps, a little trying. The night was dark, the twinkling of a few stars overhead accentuating the blackness in which we were running, our side lights had got going out—one would not work at all. The Owner insisted making the nearest port. The Skipper informed him the nearest anchorage was under the shelter of Faulkner's Island

SATANELLA.
Photo by N. L. Stebbins, Boston.

and this being agreeable, we altered our course and ran across the Sound to pick up the light. A confusing error in the Coast Pilot, which said the light was a light flashing every 90 seconds, was the last straw for the Owner. Picking up the light it flashed every 18, and it was some minutes before the Skipper had convinced himself that it was a typographical error. A tug boat appeared out of the darkness on our port quarter, and in a moment the Owner had the fog horn out blowing as hard as he could blow; he also got a flag on the awning pole, which he made the Crew wave—this in addition to cat calls, which were calculated to wake the dead, whistling, hallooing, etc., was more than the Skipper could stand for; and he read the riot act there and then. If the Owner got that tug, he would quit, go home and he and the Crew could finish the cruise themselves; there was no danger that such an exhibition was hardly to be expected from a man; the boat was sound, gear all O. K. The Crew was rather puzzled whether to keep waving the flag or not, but as the Owner stopped the fog horn, he, too, desisted, and once more quietness reigned supreme for the Skipper's outbreak of temper. It would be interesting to have the Owner's description of that night: "Waves, mountains high; wind, 60 miles an hour; didn't know where we were going (a rub at the Skipper)"; the truth, wind about 18 miles, moderately steady, short, broken sea. The Skipper had been out in open sandbaggers years ago in as bad weather. Considering that it was the Owner's third season yachting he really behaved very well. By this time we were almost on top of Faulkner's Island, and the Skipper found that the compass was off quite a good deal. Having run by the light, steering N.¼E. should have brought us clear of the buoy that marks the end of the reef, but we were inside, when the sound of the breakers were heard and the Crew forward shouted breakers ahead. We jibed her over, ran back, and stood as close as we dared. It was quick work. By great good fortune the Skipper discovered the pin was out of the arm of the anchor. It was a wet job putting it in and the Skipper enjoyed an involuntary bath, but it was finished at last, and with that anchor out we could hold in anything. Going below the Skipper changed his clothes, lay down, fell asleep, and the Crew followed his example. The Owner lay down, but he said the boat rolled too much for sleep, and he passed a restless night. Poor Owner!

Aug. 9.—When the Skipper awoke the Crew and Owner were working on deck straightening out the snarled rigging and getting up sail. It was a glorious morning, with a light breeze from the southwest, but it was not what we were looking for. The Skipper would have preferred a blow from the eastard, but such was not to be our luck. We barely held our own against the ebb tide, and it seemed as though we were destined to make another poor day's run. This was the last three days of the cruise, and we wanted to pick up some friends at the Norwalk Y. C. We made about a mile and a-half in about two hours' sailing, and, seeing a tug with a long string of barges, light, coming along, we put our flag in the rigging for a tow; the Crew got off in the dinghy and prepared to make terms. The tow was bound for New York and would take us down for $5. So standing as close as we dared, the deck hand threw us a line. You could have jumped from the Innocent to the scow, but, bless us, the Crew and Owner missed that line, and we had the satisfaction of seeing the tow move away from us, while we lay splashing in the doldrums. At this moment, however, the wind seemed to stiffen, and while we could not pick up the tow, we made good time to Southwest Ledge Light, and we picked up Stratford Point Light by 3 in the afternoon. We then decided to stand into Bridgeport Harbor, which we did, dropping our hook about 5 o'clock on the edge of the channel, in about 8 feet of water. We dined ashore this night and did not get to bed until late, a rare occurrence with us.

Aug. 10.—Up late, dawdled about, the Crew getting breakfast, after which we beat out of channel, walking away from a 30ft. sloop bound for New York. We stood inside of Penfield Light House, tacking out of the strong ebb. The breeze, as usual, began to freshen in the forenoon, and we began to log about 5 miles; the sloop we had passed earlier in the morning gave us a good tussle, and it was nip and tuck for a long while, when off Cuckenoe Island we decided to put in a reef, it having got quite blowy with nasty sea; she walked through it with a bone in her teeth, but with stability enough to enable her to carry full sail. We had trouble in reefing our jib, and the cringle not being properly lashed, it ripped as soon as the Owner hoisted it. We decided to run in to Sheffield Island that evening and wait for our friends who were to meet us there. The partial erection of a new lighthouse bothered us at the entrance to the harbor, we wondering what it was, but we soon saw that it was a lighthouse in course of construction, and standing in we dropped our hook off the Norwalk Y. C. Here we received a telegram stating our friends could not come. We had supper at one of the hotels at Belle Isle, and slept ashore that night.

Aug. 11.—We were up betimes in the morning and made sail speedily. Wind again from S.W. Slow work It looked as though we would not reach our moorings that afternoon; off Captain's Island the wind veered to the south'ard, and it was a close reach home. The wind held nicely till off Sand's Point, when it again dropped, and we hardly had steerage way. We gradually passed Belden Point, and the tide favoring us, picked up our mooring off the Club House. We did not bother clearing up, leaving that to the Crew. We got ashore quickly, found our friends waiting for us there, which we appreciated, and after changing our clothes, took the train home, saying that a cruise to be successful must be at least six weeks long, and resolving at some future time to try and spend the months of August and September in a cruise as far east as Portland.

Satanella.

We publish in this issue a picture of the auxiliary screw brigantine Satanella, which has recently been sold by Mr. Perry Belmont to Mr. Lawrence, of Cleveland, O., through the agency of Messrs. Gardner & Cox. Satanella was designed and built by Mr. J. S. White, at Cowes, in 1880. She is 136ft. over all, 113.4ft. waterline, 22.4ft. breadth and 13.5ft. draft. Satanella was formerly Golden Fleece, and was brought to this country in 1891. She is an extremely shipshape looking vessel, and is a wonderfully fine cruiser, handling well under sail and being economical when under power, having a wide steaming radius.

Reports from Queenstown state that the steam yacht Maria, which was recently purchased by Vice-Com. Frederick G. Bourne, N. Y. Y. C., put in there for repairs after encountering a terrific gale when two hundred miles off the coast. Huge seas broke over the vessel and flooded her below.

All communications intended for Forest and Stream should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Indian Harbor Y. C.'s New Classes.

The one-design class of sailabouts that the Indian Harbor Y. C. organized this year proved to be such a success that it now contemplates a larger class. The new class suggested is for boats of 18ft. waterline—craft large enough to participate in the circuit racing on Long Island Sound. Two schemes have been hinted at, one for a class of one-design boats and the other for a class conforming to the restrictions of the Massachusetts Y. R. A. The latter idea is far the better one, and it is to be hoped that it will be adopted. The one-design idea has been overdone, particularly on Long Island Sound, and we are sure that if the Indian Harbor Y. C. breaks away from this deep-rooted plan and establishes a restricted and not the one-design class, that it will meet with the success that it has had in the East, where it was not uncommon to have from twelve to fifteen starters in nearly all the contests. The circular as sent out by the Regatta Committee of the Indian Harbor Y. C. follows:

At the request of several members of the club, the regatta committee has taken up the matter of establishing a new club class for the season of 1903. Although the present one-design class of "sailabouts" has proved a success, there seems to be a demand for a class of boats somewhat larger than the "sailabouts," adapted to sailing in all weathers and qualified to enter in the open races of other clubs on Long Island Sound.

After giving the matter careful consideration the committee has decided to recommend a class of knockabouts of 18ft. waterline length, to conform to the restrictions appended to this circular, which are the same as those of the 18ft. Knockabout Association of Boston. This class of boats has proved a great success in Boston waters, so much so that about 100 boats of that type have recently been built there. The committee, however, has been unable to determine whether it would be best to establish a one-design class, viz: boats of identical construction and rig; or a restricted class which would allow individual members to select different designs from naval architects, and build thereto in conformity with the restrictions—or buy existing boats that have been built to this class, if they prefer.

In furtherance of the one-design class and also to exemplify the type of boat that can be built under the rules, the committee has obtained a set of designs for a keel boat with flush deck and another set of designs for a centerboard boat with cabin house, both of which are now on exhibition at the club house, and can be seen there until Oct. 26, and after that date at the office of the chairman of the committee, No. 29 Broadway, New York.

The committee is anxious to hear, as soon as possible, from members of the club who will build or buy boats of this class, and earnestly request an immediate expression of opinion from those members as to whether the class should be "one-design" or "restricted." Estimates have been obtained by the committee for building to the designs. Communication in regard to the class should be addressed to the chairman of the committee at 29 Broadway, New York, from whom any further information that may be desired can be obtained.

The committee again urges an early response to this circular, in order to enable it to know the wishes of the members and make timely arrangements for the construction of the boats, should they decide to build to one design.

If a one-design class is decided on and the designs submitted, for any reason are not considered satisfactory, the committee will be glad to procure plans from other designers for the approval of those members who express their desire to order boats of this class.

Frank Bowne Jones, Chairman.

Frank C. Henderson,
Charles E. Simms,
Raymond Babcock.

Restrictions of 18ft. Knockabout Class.

Definition.—A boat of this class is intended to be a seaworthy boat, with air tanks of sufficient capacity to float the boat when full of water, or water-tight cabin bulkheads, rigged simply with only mainsail, jib and spinnaker.

Length L.W.L.—The length of load waterline, with full equipment, shall not exceed 18ft.

Beam L.W.L.—The beam at the load waterline in keel boats shall be at least 6ft. 1in., and in centerboard boats at least 6ft. 6in.

Freeboard.—The freeboard shall not be less than 17in. on the said required beam, a reduction of 1in. on the freeboard allowed for every increase of 4in. of beam.

Displacement and Draft.—For centerboard boats the draft shall not be less than 2ft. 6in. for at least 4ft. length of keel.

All boats shall weigh, when rigged and equipped in accordance with these rules, not less than 4,000lbs. It shall be the duty of the measurer to see that nothing is on board when the boat is weighed, except what these rules prescribe, and that the boat is in every way in her normal condition.

Scantling, Planking and Construction.—The keel, stem, frames, house and deck beams shall be of oak or its equivalent in strength.

The frames shall be not less than ⅞in.; deck beams not less than 1¼sq. in. section; house beams not less than ¾sq. in. section.

The spacing of frames, deck and house beams to be not more than 9in., center to center. The planking, including the deck and the side of house, shall be not less than ¾in. thick; the top of house shall be not less than ⅝in. finished.

Deck clamps shall run from stem to stern, with a minimum cross section of 3sq. in. for at least one-half of the length; also bilge stringers of at least 3sq. in. cross section shall run for at least one-half the extreme length of the boat amidships. Clamps and stringers to be of yellow pine or its equivalent in strength.

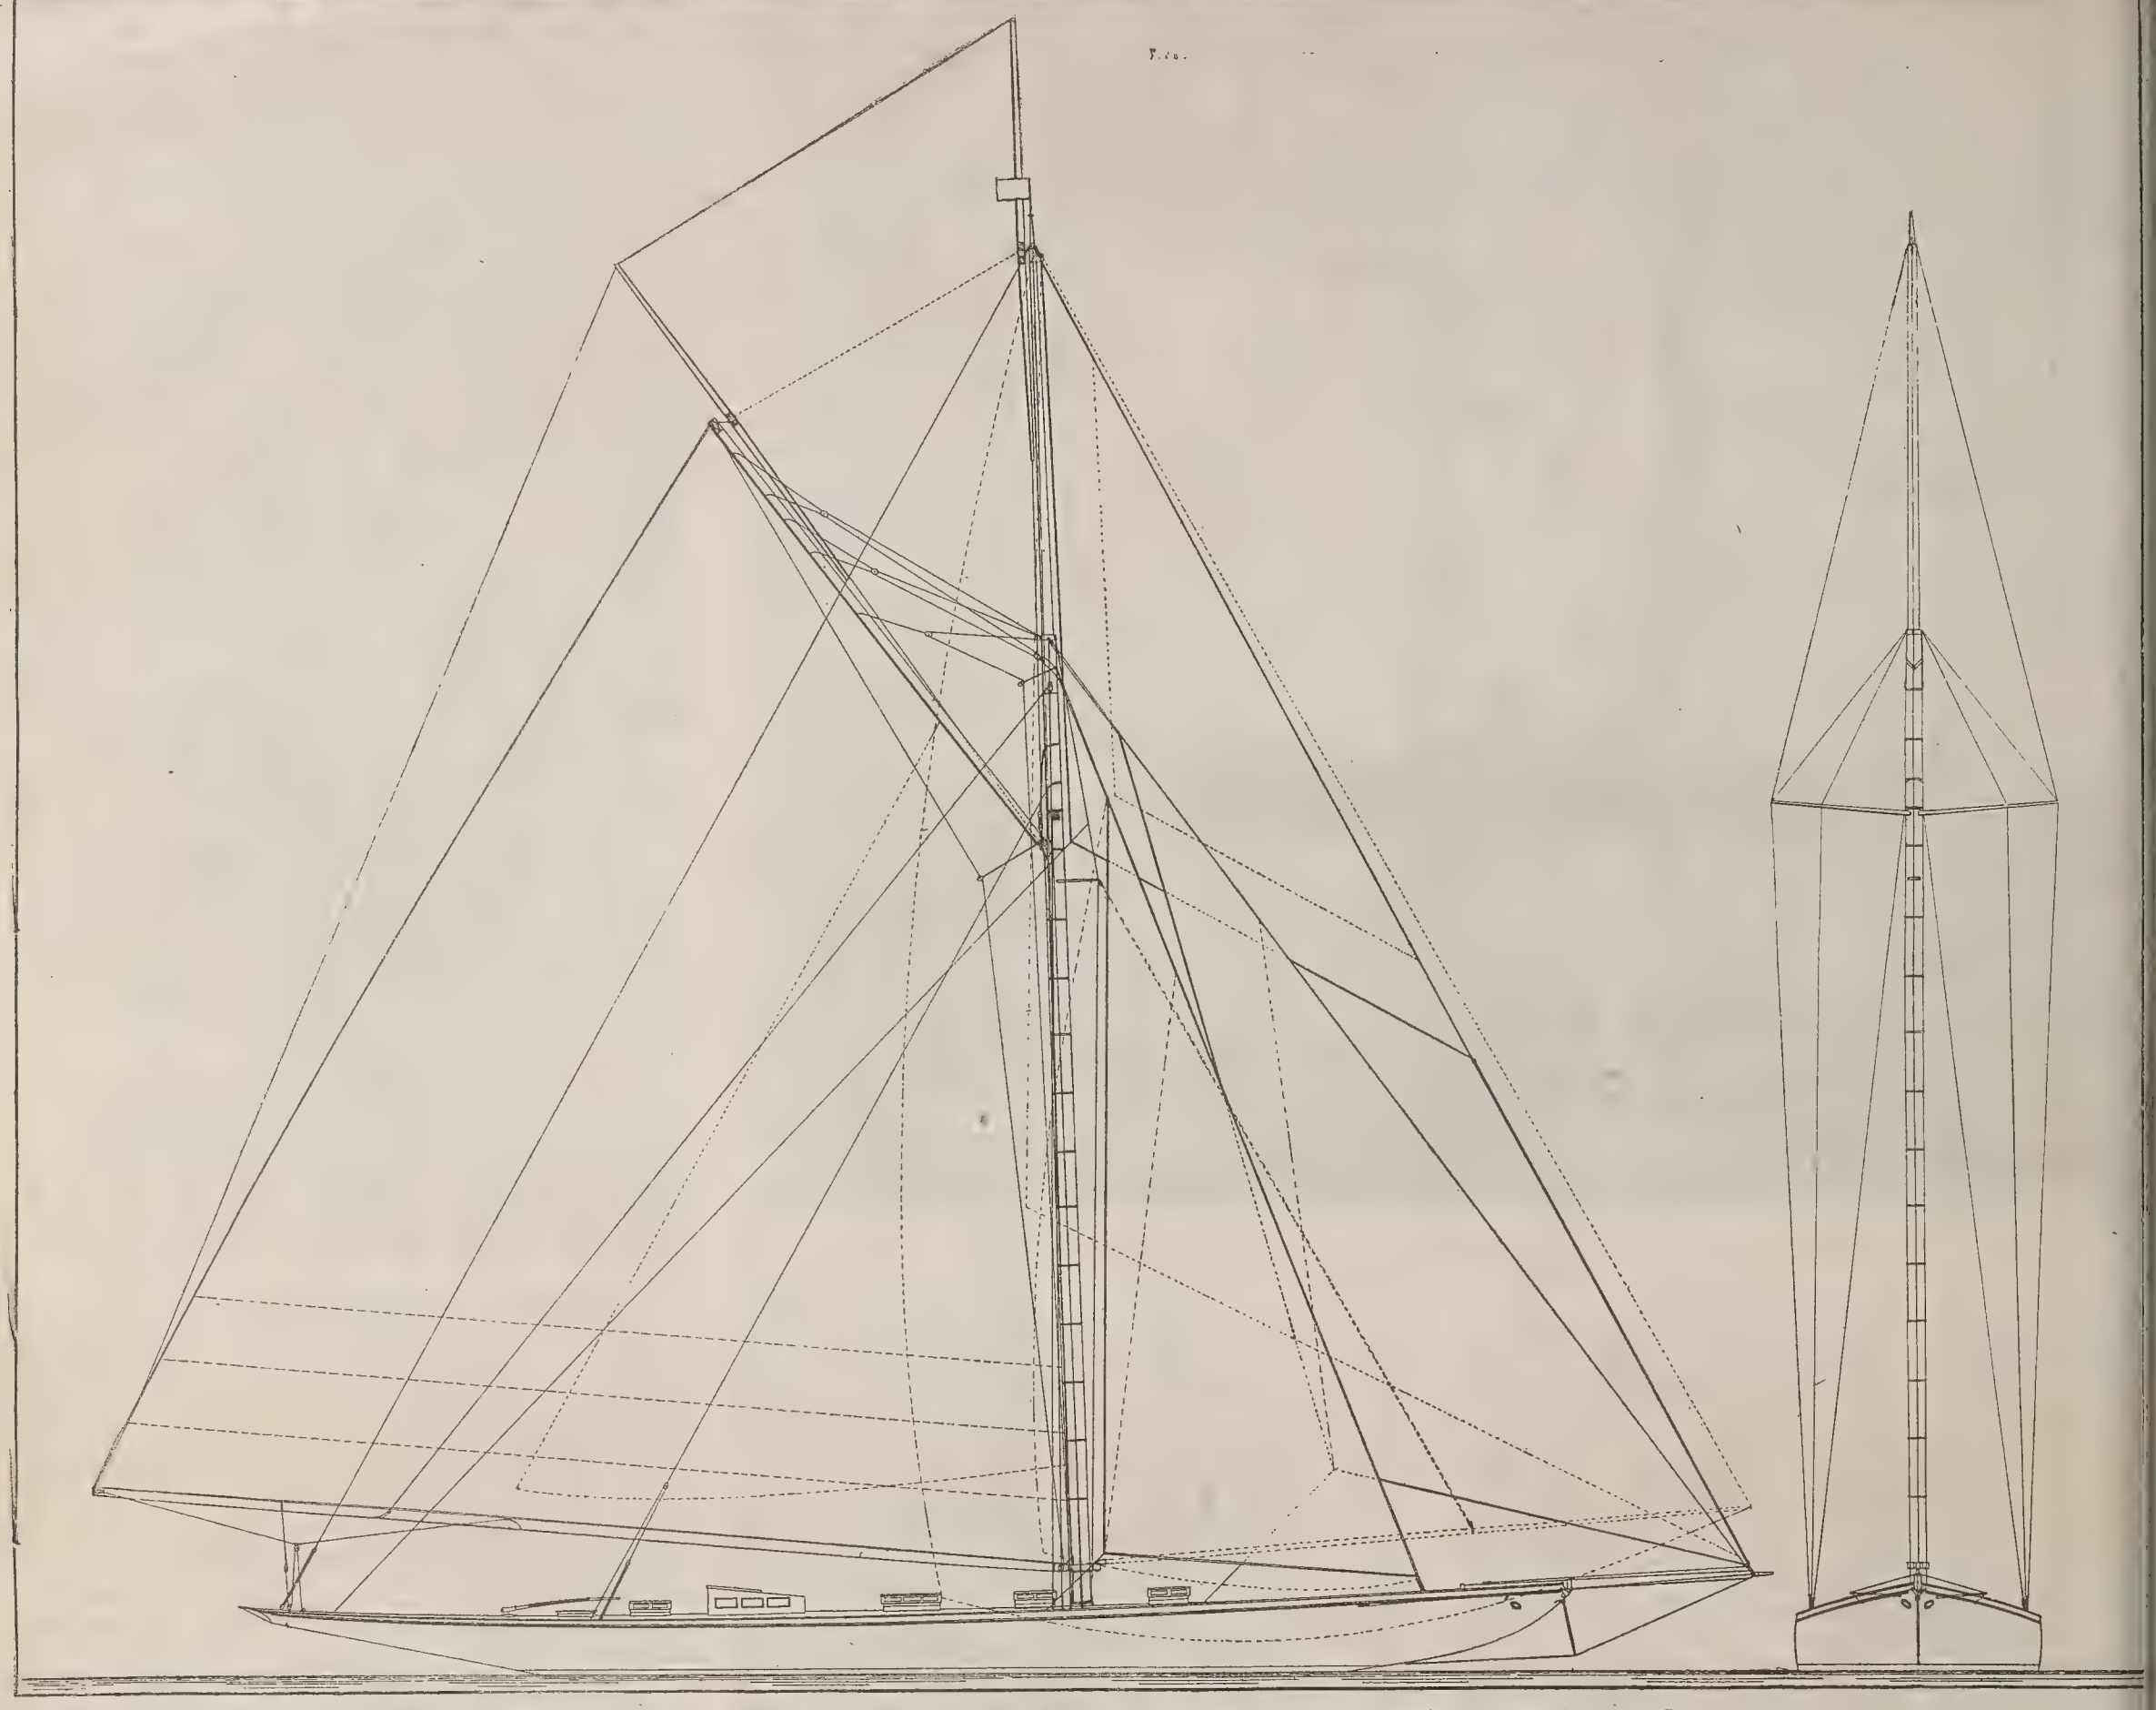
Sails.—The sail area shall not be over 450sq. ft., and not over 360sq. ft. of actual sail area shall be in the mainsail. The measurer shall be provided with a correct sail plan of any boat to be measured; and shall cause distinguishing marks to be placed on the spars as follows: On the mast at the tack, and at the throat of the mainsail, on the boom at the clew of the mainsail; on the gaff at the peak of the mainsail. No part of the mainsail shall be allowed to extend beyond these marks. The marks shall be black bands painted around the spars. The inner edge of the bands shall be the limits of the sail. The actual area of the jib shall be measured.

The extreme distance in feet from mast to end of spinnaker boom, when in position, as used, shall not be more than 324, divided by the distance in feet from deck to spinnaker halliard block. No battens over 26in. allowed to be used in sails.

Equipment.—Equipment to include anchor, not less than 21lbs., and cable of not less than 30 fathoms of 1⅛in. rope; also bucket, pump, compass, fog horn, boat hook, lead and line, lantern and three life preservers.

Crew.—The crew is limited to three persons, and the helmsman shall be an amateur.

Mr. Cornelius Vanderbilt has changed the name of the steam yacht purchased this year from Cherokee to North Star. The yacht will be laid up for the winter at Greenock, Scotland. She will be fitted out in the spring for a Mediterranean cruise.



SIXTY-FIVE RATING CUTTER—SAIL PLAN—DESIGNED BY MESSRS. HERRESHOFF & WELLS.

Boston Letter.

BOSTON, Oct. 20.—Outside of the natural interest that is always noted after a challenge for the America's Cup has been opened and its conditions acted upon, there is little of anything new doing in actual yacht building around Boston, and what interest may be taken in the smaller restricted classes will, without doubt depend entirely upon the action taken by the Yacht Racing Association of Massachusetts at its special meeting, to be held Thursday evening, Oct. 30. The regular October meeting was held last Thursday and it must be said of that gathering that there might have been more delegates of clubs present. The matter of changing the restricted 25ft. and 21ft. classes was brought up, and it was voted that the Executive Committee bring in rules for new classes of those dimensions, at the coming special meeting, to correspond with the present restricted classes on rating.

Considerable objection was offered by Mr. Louis M. Clark to the adoption of the proposed new 22ft. class. Mr. Clark argued against its adoption at some length, and it was finally decided to lay the matter of adoption over until the special meeting. This course was sensible in two ways: First, because it would seem that the matter should receive more than passing attention before being voted upon, and second, it was probably reasoned that the motion to adopt would have been lost, as a two-thirds vote would have been necessary, and the attendance of delegates was small.

There is considerable speculation in regard to the possibility of the 22ft. class being adopted, although it is thought likely that, at the next meeting of the Association, the majority will be for adoption. It is realized by the majority that something must be done with the rules of the present restricted classes, although there is none of the racing yachtsmen who would care to see the classes so altered that existing yachts would be barred. An interesting feature in regard to this position is the present construction of a yacht of 25ft. waterline which is 48ft., or thereabouts, over all. It can hardly be said that such extreme overhangs are desired by the majority, and it is not considered likely that many of the yacht owners in the 25ft. class will care to race against a yacht which has such an immense advantage in length to commence with. But, on the other hand, the construction of this yacht was commenced before any changes were made of a radical nature in the present rules. Technically, under the rule of the Association, she should be allowed to go into the class as an existing boat, and there is where the rub comes.

The adoption of a new measurement rule, under much the same formula as proposed for the New York Y. C., has been considered by more than one of the Executive Committee. The adoption of such a rule would undoubtedly alter the measurements of many existing yachts in the restricted classes, and might have more or less bearing upon what might be considered otherwise existing boats. The adoption of this measurement rule is not favored by all, and there are some delegates who are decidedly opposed to it. It is realized, by the conservative yachtsmen, however, that something must be done, if the racing classes in Massachusetts Bay are going to be continued. There must be some rules provided that will put the yachts of different types on something near an equality, rules which will not make it necessary for a yachtsman to build only one type of boat, if he wishes any kind of a show in the racing. It is, however, the hardest kind of a task to get the majority of yachtsmen to favor any direct change of rules. When the present restricted classes were formed, there was such a howl went up that future racing seemed in doubt for a while; but, with time, it was discovered that there were many merits in the rules, and the disposition to build in the Y. R. A. of M. restricted classes has been apparent to all during the past three years.

There has been considerable talk of a possible Cup defender coming from the board of a Boston designer, but it can be stated positively that no order for any such boat has as yet been received. It may be possible that some of the members of the Eastern Y. C. will get together and form a syndicate for the purpose of building a defender, but prominent members of the club have expressed the belief that such a syndicate is not a probability.

MacConnell Bros. have sold the auxiliary 43-footer Anna to H. B. Stone, of Ilion, N. Y.; the 18-footer, Aspinquid, to Channing Williams, and the power launch, Namet, to J. F. Mackell, of Philadelphia.

JOHN B. KILLEEN.

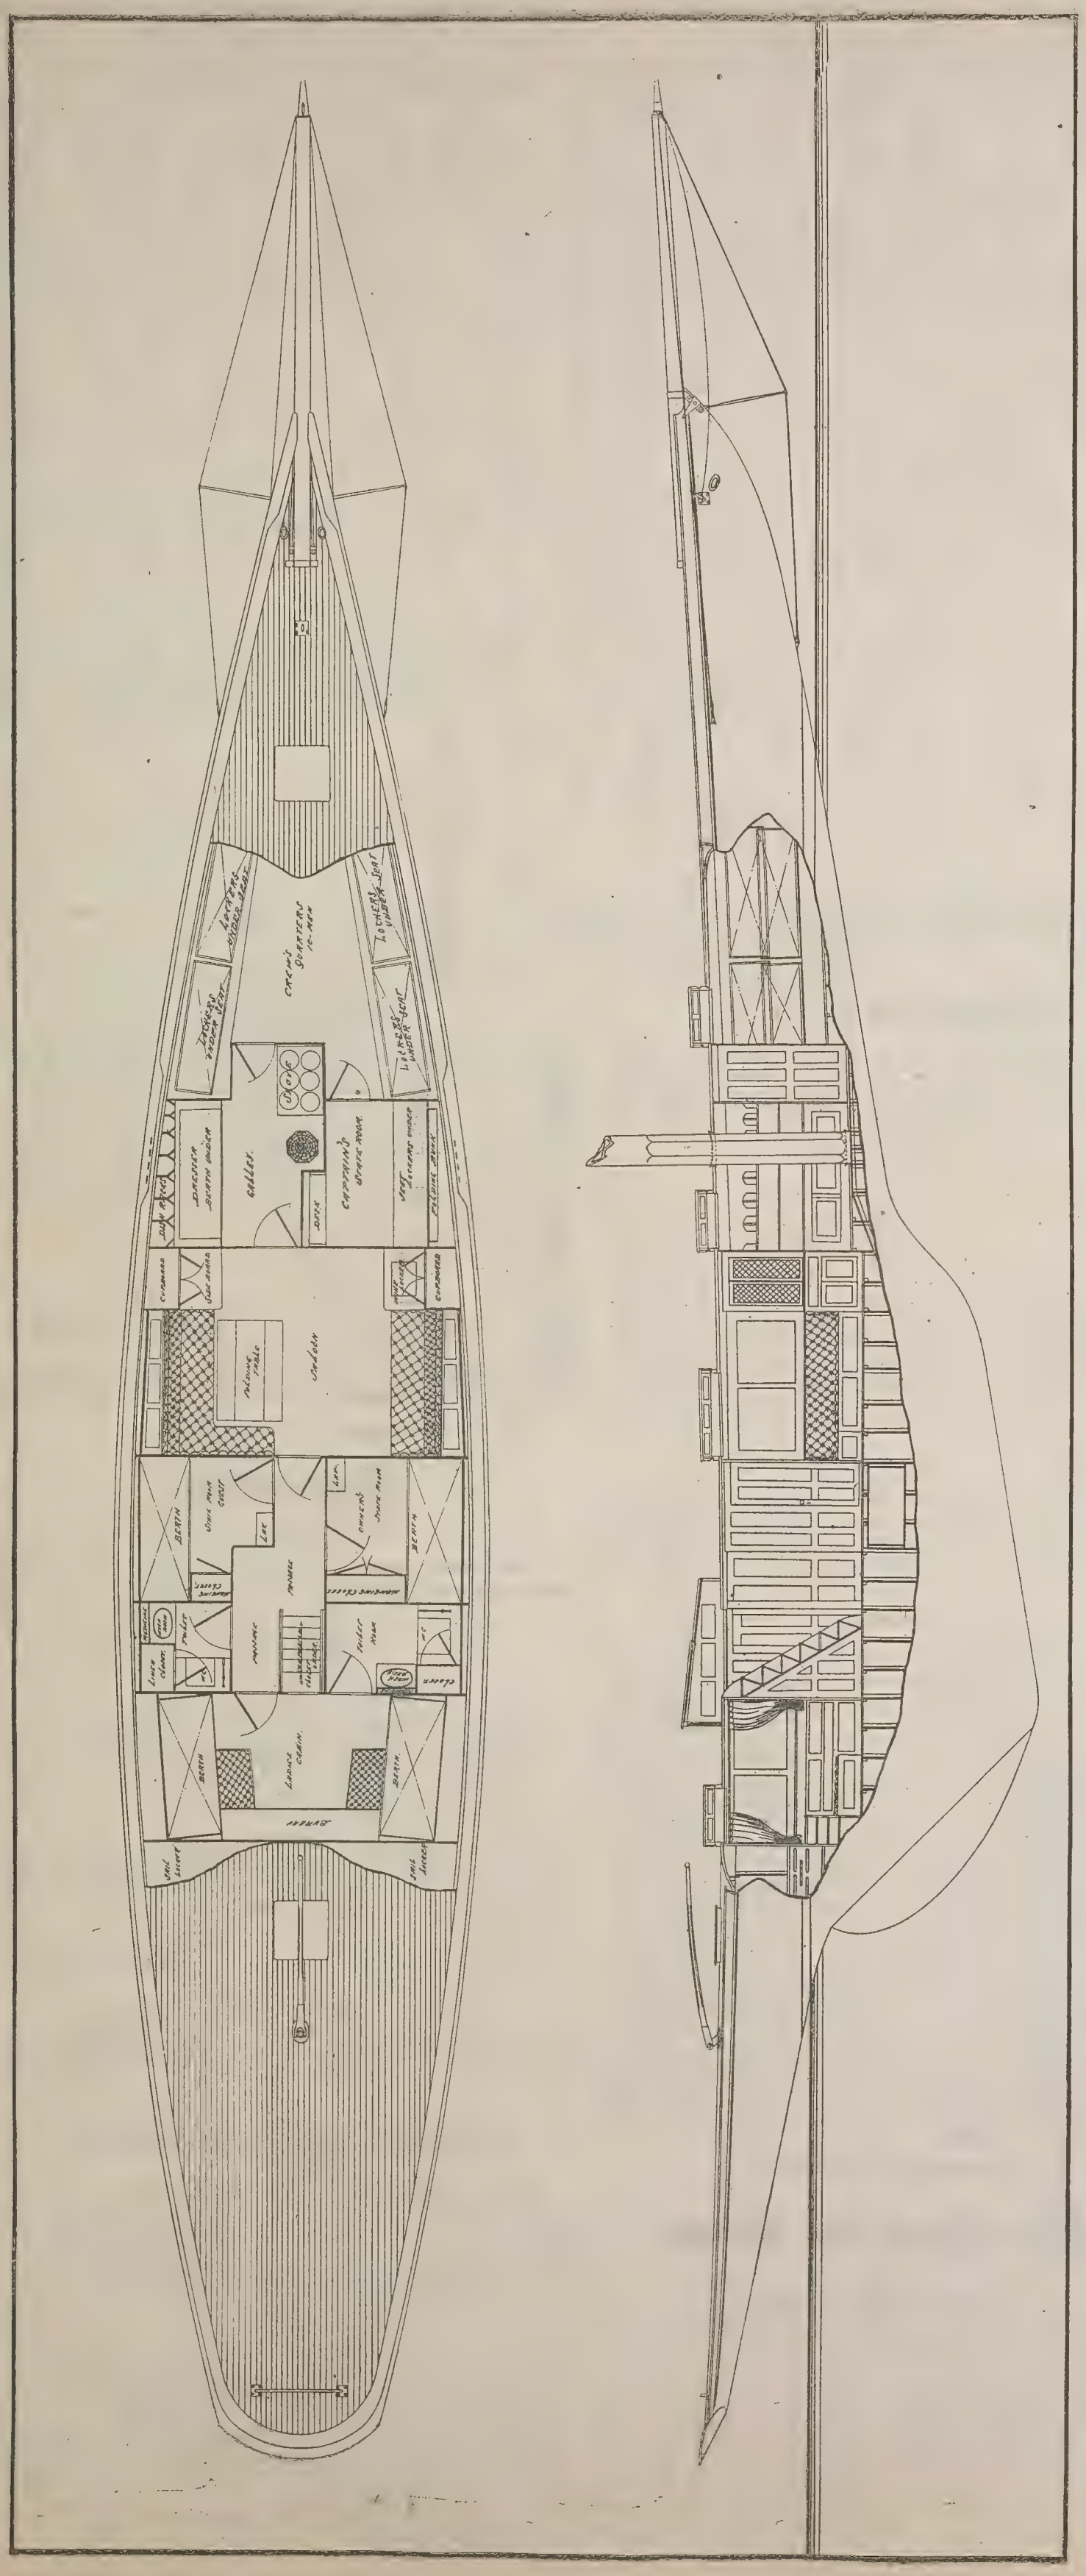
English Letter

NOTHING has been heard of late in reference to the projected new one-design class for the Solent, but it is not likely to have fizzled out. This is the time of year when owners, or, rather, intending owners put on their considering caps for the following season, and, so far, they are all still hard at work thinking, for not a single order for any type of boat, handicap or racer, has as yet been given. There are only three open classes likely to attract an owner if such a person be forthcoming—viz., the big class, the 52-footers and the Clyde 36-footers. The most successful of the last-named class was designed by Alfred Mylne, though the Fife boats ran her close. Therefore, in that class there are all the elements of good competition, and if the boats were a little more to the liking of the Clyde yachtsmen there would certainly soon be a hot class. But the tendency of our rule is to cut down draft, at a point three-fifths the loadline length from the stem, until it is just one-half the beam—this giving the best girth measurement—and aft of this draft is obtained by a drag at the heel, the underwater profile being almost a perfect triangle. The mistake in the rule is that one can get this extra draft without paying for it, and another fault is that sail is taxed too heavily. If these matters were adjusted, I think the New York Y. C. would look far enough before they get a better rule.

For some reason or other we have had a 42ft. class on our statute books for very many years, and nobody has ever built a boat for it. From time to time one hears of a combine among owners to start it, but the enterprise is never carried out, originating, apparently, only in moments of exaltation. If this class had ever come into existence, it would probably have proved far more popular than either the 36-footers or the 52-footers. But it seems idle nowadays to discuss these questions when the conviction is rapidly being forced upon yachtsmen that the absence of any check on expense has given the death blow to yacht racing as hitherto conducted. Even the daily papers have failed during the past fortnight to live up to the Lipton challenge. These international races have no effect whatever on our season, and people over here find it hard to understand why they should prove disastrous to yours. If we won the Cup, I don't think our other racing would be in the least degree disturbed by a challenge. It is rumored here that the new Herreshoff schooners, supposed to be building, will be of 90ft. water line, which looks more like business than the dimensions of Meteor. This is the length of Cicely, but it should be remembered that she was not built for the prime purpose of racing. Had that been so, her draft would probably be more and she would hardly have been built to class at Lloyds. By the way, I think I am not indiscreet in mentioning that Lloyds' new scantling tables for yachts will be published at no distant date, and I shall be surprised if they are not found exceedingly satisfactory.

There is some talk of founding an Institute of Yacht Architects, on the lines of the Institute of Naval Architects. The organization would be of very great use to builders and designers alike. At present the value of the I. N. A. to yachting is absolutely nil, and indeed some of the observations on yachting attributed to members of that body are ludicrous.

Motors are still in the yachting atmosphere with us. Several new American engines have lately been placed on the market, and the distinctive feature of these is the favor shown to two or more cylinders over the one cylinder engine, and also the gradual recognition by American makers that the 4-cycle engine has virtues all its own



SIXTY-FIVE RATING CUTTER—CABIN PLANS—DESIGNED BY MESSRS. HERRESHOFF & WELLS.

Our makers for the most part are steadily pegging away at the 4-cycle type, and they are doing good business. Some of your best makers openly condemn these engines, but they will be wise, if they want to keep a good footing over here, to devote some time and work to making them, in sizes over, say, 8 horse-power. I understand there is to be an exhibition of motor boats in Sweden next season, when no doubt some transatlantic exhibits will be on view. Meantime, an enterprising Cont nental genius has immortalized himself by inventing a new method of marine propulsion. His plan is to drive the propeller, not in the water, but in the air! Of course it is a big propeller, but no doubt it could be reefed. Inventors are sometimes very funny. Not long ago, one gave a demonstration of his patent on the Thames. It consisted in driving a boat by the recoil of a quick-firing gun—that is my description but his filled quite a volume. The boat did move—a little—but every time he fired the gun, the poor man fell over it on his face! The recoil drove the boat ahead a little too suddenly. The experts invited to witness the display were very much impressed, though none volunteered to test the device personally.

E. H. Hamilton.

Sixty-Five Rating Cutter.

Through the courtesy of Messrs. Herreshoff & Wells we publish the sail and cabin plans of a cutter yacht designed to race in the English 65-rating class. Nevada, designed by Mr. Herreshoff, took the championship in the 65-rating class for the season of 1901, and the design we reproduce was intended as an improvement on Nevada.

The design complies in every respect to the English Y. R. A. rules. The boat is very roomy, having far more cabin space than is usually found in racing yachts of this size. While designed to race in British waters, the boat could with some slight changes be adapted for racing in America.

The sail plan is particularly well balanced, and it makes a very handsome rig. Her dimensions are as follows:

Length—	
Over all	92ft. 6in.
L.W.L.	56ft. 0in.
Overhang—	
Bow	15ft. 6in.
Stern	21ft. 0in.
Breadth—Greatest	17ft. 0in.
Freeboard—	
Bow	6ft. 3in.
Least	3ft. 6in.
Taffrail	4ft. 9in.
Draft—Extreme	10ft. 4in.

The cabin arrangement is very good. The companionway leads to a steerage. The after cabin, which is reached from the steerage, extends the full width of the boat; on each side are berths, in front of which are transoms. A large dresser and bureau is placed against the after partition. There is a closet under the companion stairs. On the starboard side forward there is a toilet room which opens from the after stateroom. The room is fitted up with a patent closet and a set wash basin. Forward of this toilet room is the owner's stateroom. This room is 6ft. 6in. long and is fitted with a wide berth, closet, transom and hanging closet. On the port side opposite is a guest's stateroom, and another toilet room. These rooms are fitted up very much the same as the ones described on the starboard side.

The main saloon which is amidships is 10ft. 6in. long and extends the full width of the boat. On each side are the usual transoms and buffets and wine lockers. Overhead there is a large skylight. Forward on the port side is the galley, which is quite roomy and well equipped. The berth on the port side is for the steward. This is where on American vessels the ice box is usually located. On the starboard side is the captain's stateroom, which is reached from the forecastle. The forecastle is roomy and there is accommodation for ten men. Aft there is a lazarette, where there is ample room for light sails and spare gear.

Points for Amateur Yachtsmen.

The Boston Advertiser prints the following sensible advice, valuable to all amateur sailors, from one of Boston's oldest and best known pilots:

"You must believe that an approaching squall is the heaviest one you ever saw or heard of, and make up your mind to face the danger with coolness and decision. No man can tell how hard a coming squall may be, and sometimes they occur with very little warning, indeed. In the summer time, however, squalls can, as a rule, be seen long enough before they strike for the yachtsman to take ample measures for safety.

"When the squall is seen approaching, anchor if possible under the lee of an island or some other land, out of the tide. That is the very safest thing to do. And don't forget to keep out of the tide, for if you are in a tide-way the water is rougher, it brings the yacht broadside to the wind, unless setting just right, and makes her liable to capsize. If the anchorage is out of the tide, the boat swings head to the sea and rides easily.

"Most summer squalls come on the flood tide. Why this is I don't pretend to say, but my experience of thirty-five years confirms the statement. There are exceptions, but in nine cases out of ten the rule will prove true. That being the case, when the tide is flood the sharpest lookout should be kept, although the competent skipper watches the weather closely at all times. If rain comes before the wind you never can tell what is back of it. If the wind comes first, the squall is likely to be of short duration, for the rain which follows kills the wind and beats down the sea. A second squall in the latter case must be looked for, however, for it is likely to follow.

"If there is no lee under which you can run and anchor, or there is no time to do so, then get the sails off the yacht as quickly as possible and furl them snugly. If you are in a sloop, lower the jib first, so that she can be luffed up easily and pointed in the direction from which the wind will come. The idea that a squall can be shaken off is a false one, and should not be countenanced for a moment. And don't forget when a squall is approaching to close the cabin or cuddy up tightly,

The Association race of Sept. 20 did not count for points on series prizes.

seeing to it that no one remains inside. In squally weather never have any one in the cabin when the sails are up. There have been too many instances where people have been drowned in cabins who otherwise might have been saved."

Yacht Racing Association of Gravesend Bay.

Season of 1902.

THE Yacht Racing Association of Gravesend Bay ended its second season with the regatta given under the immediate auspices of the Association itself off the Atlantic Y. C. on Sept. 20. This event brought to a close the series of nine races. The first eight counted for points on the series prizes for the year, while the last was for special trophies offered by the Association.

The healthy growth of the Association has been marked. Nearly twice as many craft have competed as in the initial year, events have been closely contested, and the whole campaign has well illustrated the possibilities of racing on Gravesend Bay.

Classes P and Q have been the star divisions. Not because of closer finishes, but because of the consistent entry in each of the regattas.

The class winners of the series prizes on points for the first eight races were Sunol, Vivian, Caribou, Cockatoo, Trouble, Kelpie and Martha M. Those capturing second prizes, two-thirds the value of firsts, were Bonito, Squaw, Song and Dance, Bronco, Stinger and Rascal.

The winners in the Association race of Sept. 20, for special prizes, were Sunol, Squaw, Cockatoo, Bronco Pebble, Jig-a-Jig and Boozie. Second prizes went to Bonito, Vagabond, Flying Fish, Kelpie and Rascal.

Eighteen newcomers entered the contests of the year, six of which brought with them creditable records from other waters. Caribou Cockatoo, Song and Dance, Kelpie and Stinger competed in every contest. Sunol, Bonito, Trouble, Bronco, Wraith, Quinque, Martha M. and Rascal have started in all but the Brooklyn Y. C. regatta of June 21, in which, because of the threatening weather conditions, only the five first mentioned craft competed. Throwing out the record of this contest, one-third of the entire fleet competed in the eight races held under favorable conditions.

Thirty-nine different craft competed in the nine races of the year. Two hundred and five starters of all classes entered the races, which makes an average of twenty-three boats to each event. Twelve of the craft have flown the flag of the Atlantic Y. C., twelve that of the Brooklyn Y. C., eight the burgee of the New York C. C., while seven were enrolled in the Marine and Field Club.

The outlook for the season of 1903 is especially bright. New additions to all of the classes are assured, and Gravesend Bay Corinthians expect better competition than ever before. The official records of the year are appended.

Seawanhaka-Corinthian Y. C.

OYSTER BAY, LONG ISLAND SOUND.

Saturday, Oct. 11.

ON Saturday, Oct. 11, a match race was sailed over knockabout course No. 3 of the Seawanhaka Corinthian Y. C., between the Seawanhaka knockabouts Gowan and Marcia, to determine the disposition of the series prize which was offered to Seawanhaka knockabouts in the three days' racing in June, which resulted in a tie between Gowan and Marcia. The race on Oct. 11 was sailed in a S.E. wind, varying from light to full sail at the finish. The preparatory signal was given at 3:15, and the start at 3:20. The times at the finish were:

Marcia, Johnson de Forest	5 46 25
Gowan, F. G. Stewart	5 55 30

The result of this race gives the series prize to Marcia.

YACHTING NEWS NOTES.

Mr. Charles G. Davis has designed an auxiliary cruising yawl for Dr. Richard J. Schofield, of New York City. She is to be 27ft. waterline, 37ft. over all, 10ft. breadth and 3ft. draft. The yacht will be equipped with an 8 horsepower King engine.

Mr. Hollis Burgess has made the following sales through his agency: The 25ft. Bar Harbor knockabout Oeewah, owned by Mr. Walter T. Wallace, of New York, to Mr. T. S. Hathaway, of New Bedford; the fast 21ft. Buzzard's Bay knockabout Amanita, owned by Mr. Joshua Crane, Jr., of Westwood, Mass,, to Mr. Edwin Bonsack, of Jamestown, R. I.; Idylis, owned by Mr. Charles E. Stone, of Newburyport, Mass., to Mr. W. H. Sargent, of Moosup, Conn. She has been shipped by rail to Buzzard's Bay, where she is to be used; fast speed launch So Long, owned by Mr. J. A. Burnham, Jr., of Boston, sold to Mr. Joshua Crane, Jr., of Westwood, Mass.

Mr. William P. Kirk, of Tom's River, N. J., is building from designs made by Mr. Henry J. Gielow for Major J. Fred Ackerman, a centerboard cruising sloop. She will be 70ft. over all, 45ft. waterline, 16ft. 11in. breadth and 4ft. draft. The yacht will carry 3,000 sq. ft. of canvas.

The Marine Construction and Dry Dock Company now have their remarkably fine shipbuilding plant in full running order. In addition to the shipbuilding establishment, this firm has a yacht basin 600ft. by 180ft. The property, located on the north shore of Staten Island at Mariners' Harbor, is sheltered by Shooter's Island. Vessels lying in the basin are absolutely protected from rough water and ice. The location makes the plant particularly free from heavy black smoke and dirt. Proximity to Newark Bay affords the cleanest water for storing yachts about New York city. A marine railway now in operation will haul any yacht requiring land storage. The officers and consulting staff of this company are as follows: H. Newton Whittelsey, President, formerly New York Shipbuilding Company, and Gas Engine & Power Co. and Chas. L. Seabury & Co., Consolidated; Ralph Derr, Treasurer, formerly New York Shipbuilding Co. and Wm. Cramp & Sons; Harold Lee, Secretary, formerly New York Shipbuilding Co. and Crescent Ship Yard; James Swan, Consulting Naval Architect, now Scientific Engineer of New York Shipbuilding Co.; C. C. Thomas, Consulting Marine Engineer, now Chair of Marine Engineering and Naval Architects of New York University; F. S. Brinton, Constructor, formerly Crescent Ship Yard.

Rifle Range and Gallery.

Cincinnati Rifle Association.

CINCINNATI, O.—At the regular meeting of this Association on Oct. 12 the following scores were made, 200yds., off-hand, Standard target:

Strickmeier	91	89	87	87	84	Lux	78	75	75	74	73

* On rest.

Ossining Gun Club.

OSSINING, N. Y., Oct. 18.—The Ossining Gun Club has established a very comfortable 50ft. rifle gallery, and offers four cups for competition; one for members, one for non-members, one for ladies, and one for cadets of military academies. Ten shots with a possible 250 to constitute a score, and re-entries unlimited. The regular gallery rifles only to be used in prize contests. Target ¼in., 25-ring. Scores to date for prizes are as follows:

Members: Wm. P. Hall 225, 205, 224, 222; Dr. E. B. Sherwood 229, 229; D. Brandreth 226, 230, 233; Wm. H. Coleman 229, 229.

Non-members: Geo. N. Tompkins 226; Albert Emmett 224, H. M. Schnaar 219, 216; T. V. Roe 229; C. H. Sidman 212, 230, 220, 227, 233, 227, 230; Ed. Bellington 228.

Ladies: Mrs. E. F. Ball 229, 236.

Cadets: Ted Sherwood 218.

E. F. B.

The Field, London, of Oct. 11 states that "the Lord Mayor has consented to accept the custody of the Palma trophy, which the British team, under Major the Hon. T. Freemantle, won by defeating the United States and Canadian teams at Ottawa, on Sept. 13. He will receive the trophy at the Mansion House on Saturday, Oct. 18, at the same time that he receives the Elcho Shield and international challenge trophy. The Palma trophy will be shot for at Bisley next year."

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Oct. 22-23.—Crawfordsville, Ind.—Crawfordsville Gun Club's tournament. M. Stillwell, Sec'y.

Oct. 24-26.—Bisbee, Ariz.—Tenth annual tournament of the Arizona State Sportsmen's Association. M. J. Cunningham, Sec'y.

Oct. 29-30.—Raleigh, N. C.—Two days' shoot of the Raleigh Gun Club; $100 added each day. R. T. Gowan, Sec'y.

Oct. 30-31—Dalton, O.—Annual fall tournament of the Dalton Gun Club. Ernest F. Scott, Captain.

Oct. 30.—Augusta, Ill.—Second target tournament of the Augusta Gun Club. Frank Bacon, Sec'y.

Oct. 31.—Ceres, Pa.—First annual tournament of the Ceres Gun Club. Targets and live birds. L. B. Learne, Sec'y, Ceres, N. Y.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Newark, N. J.—South Side Gun Club target shoot, every Saturday afternoon.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

CONTESTS AT INTERSTATE PARK.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice. Café and hotel accommodations.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

We fancy "the Daddy of Them All" was not in the competition to which the clipping taken from the Dayton Herald of Oct. 18 refers: "Bellbrook clay-bird shooters gave a turkey shoot last Wednesday, and a few of the Dayton crack shots went down ostensibly to bring home a few gobblers for Thanksgiving roasts. They are now getting the roasts, but the turkeys are not in evidence. One good-natured visitor declared that he broke 10 straight, tied up with several farmers, shot off the tie and lost. He did the same thing in several events. One old farmer, shooting a repeater, furnished a number of birds at so much per, then turned around and won them all back again. When the Daytonians came home a purse was made up, and each was presented with a chicken as a testimonial from the Bellbrook Club."

The programme of the North Carolina State Fair Trapshooting tournament, Raleigh, Oct. 29-31, can be obtained on application to Mr. R. T. Gowan, secretary of the Raleigh Gun Club, under whose auspices the tournament is held. The directors of the tournament are Col. J. T. Anthony, Jas. I. Johnson, J. S. Gray, G. N. Walters and B. Stark. There are ten events on the programme of the first two days, 15, 20 and 25 targets, a total of 190 targets, $19 entrance, $100 added money for each of those days. Oct. 31 is set for the State championship shoot, open to residents of North Carolina only. It is for a handsome silver trophy given by the Raleigh Gun Club, the conditions of which are 25 targets, magautrap; 50, expert traps; entrance $3.50, targets included. Sweepstake handicaps, 14 to 22yds. Moneys divided 40, 30, 20 and 10 per cent. Money events open to all. Targets, 2 cents. Those who so prefer may shoot for targets only. Shooting commences at 10 o'clock. Guns and ammunition sent care of the secretary, Mr. R. T. Gowan, will be delivered on the grounds free. Loaded shells may be obtained on the grounds. Concerning fares, the club presents the following: "The railroads all give a rate of one first-class fare, plus 50 cents for one admission to the fair for the round trip to Raleigh during the State fair. These low rates apply from all points in North Carolina, also from Norfolk, Richmond, Lynchburg and Danville and intermediate points in the State of Virginia."

The daily press recounts that "The Rod and Gun Club recently organized at Rockville Center, L. I., with Nelson L. Seaman as president, is arranging to have a busy fall in clay bird shoots, quail and partridge hunting, etc. The membership of the club includes some of the best gunners in Rockville Center and Brooklyn. A pack of fifteen hounds is scattered among the members, and will be used in hunting tours of the club. A room for meeting purposes has been secured at the Junction Hotel. It has been fitted up to represent the interior of a log cabin, with gun racks, bunks and tables."

At the New London, Ia., tournament last week, Mr. W. R. Crosby won the cup for high average of the two days' target and live-bird programme, shooting from the 22yd. mark. In the live-bird events, he shot from the 33yd. mark. Other winners were as follows: Chick Ross won the county championship cup, Dr. Cook won the county championship live-bird cup, Nichols was second in general average with 89.7, won the long-run cup with 69 straight, and tied Crosby for target high average. Mr. Guy Burnside distinguished himself by skillful shooting, being third in the general average of the entire programme with 87.2 per cent.

The match between six-man teams of the Nishoyne Gun Club, of Orange, and the Mountainside Gun Club, of West Orange, N. J., held on the grounds of the latter last Saturday, was won by the latter by a score of 110 to 95, each man shooting at 25 targets, as follows: Nishoyne Club—O. L. Yeomans 19, W. Drake 23, R. B. Baldwin 13, W. Slater 17, Charles Dean 19, D. Adams, Jr., 19; total 110. Mountainside Club—George Ziegler 22, A. W. Baldwin 20, H. D. Wethling 20, Charles J. Ziegler 13, Fred Wright 12, John Gantz 8; total 95.

We have a letter of inquiry from Mr. C. W. Floyd, concerning the match with him as suggested by Mr. I. A. Hudson, of Dagsboro, Del. It will be recalled that Mr. Hudson desired a trapshooting match with Mr. Floyd, the stake being a farm each. Mr. Hudson's letter of defiance was bravely worded. Mr. Floyd's acceptance was prompt, brief and direct, and as a further evidence of good faith he placed a forfeit in our hands. Mr. Hudson's silence would seem to indicate that, as they say in the South, he is "hiding out."

At the shoot of the Jeannette Gun Club, at the old Guttenberg race track, New Jersey, on Oct. 17, Mr. C. Meyer won Class A trophy, killing 10 birds straight in the main event, and 8 more in the shoot-off. He stood at the 28yds. mark. In the challenge medal match at 15 birds, he defeated Mr. C. Steffens, the holder. He will go back to the 30yd. mark in future contests.

The host of friends of Mr. Hayes Keller, son of the renowned T. H. Keller, will rejoice to learn that he is convalescing rapidly from his recent severe attack of typhoid fever, and in due time will be able to resume his duties as traveling representative of the Peters Cartridge Company, in which position he has achieved eminent success.

At the shoot of the Garfield Gun Club, Chicago, Oct. 18, the winners in the third trophy event of the fourth series were: Class A, Hellman, 24; Class B, Jones, 20; Class C, Wilson 15. Dr. J. W. Meek won the cup shoot with a score of 23 out of 25, of which 15 were singles and the remainder 5 pairs. The attractions of wildfowl shooting impairs the attendance at the club shoots.

Mr. Frank Bacon, Augusta, Ill., writes us as follows: "Please publish the inclosed notice of our target tournament, to be held Oct. 30. Trapshooting is booming in western Illinois this season. This is our second tournament this summer, and good attendance is looked for, as we had forty shooters at our first."

A quiet meeting was held in Newark, N. J., on Tuesday of last week, for the purpose of making a political issue as to the election of candidates who are antagonistic to pigeon shooting at the traps. This would seem to be something like fooling with the buzz-saw.

In a brief note, dated Oct. 16, at Winnipeg, Man., Capt. A. W. du Bray touches on the game shooting as follows: "I have had and am having splendid chicken and duck shooting, and I am going to try the geese also. I am using my 20-bore exclusively."

The daily press recounts the death of Harry F. Longnecker, of Allentown, Pa., Oct. 16, from typhoid fever. He was famous as a wing shot and dog fancier, and was Registrar of Wills of Lehigh county. He was forty-four years old at the time of his death.

Mr. A. B. Learnes, secretary, writes us as follows: "Will you kindly announce that the Ceres, Pa., Gun Club, will hold its first annual tournament at targets and live birds on Oct. 31. Post office address is Ceres, N. Y."

The seventh contest for the Troisdorf medals, at the shoot of the Cincinnati Gun Club, Oct. 18, was won as follows: Class A, Messrs. Randall and See, 45 out of 50; Class B, Mr. Herman, 45.

Geo. C. Lebohner, proprietor of Dexter Park, Brooklyn, L. I., died on Sunday of last week from hemorrhage of the lungs and stomach. He was well known among trapshooters.

The Richmond Gun Club, of Silver Lake, Staten Island, will hold an all-day shoot on Election Day. Mr. A. A. Schoverling, 302 Broadway, New York, is the secretary.

The third contest of the Crescent Gun Club, Bay Ridge, L. I., last Saturday, was won by Dr. J. J. Keyes, with a score of 48 out of a possible 50.

BERNARD WATERS.

Richmond Gun Club.

SILVER LAKE, Staten Island, Oct. 18.—Following are the scores made at the shoot of the Richmond Gun Club to-day:

Events:	1	2	3	4	5
Targets:	10	10	10	20	30
F W Schoverling	9	4	9	15	23
G C Williams	6	3	4	9	10
G Bechtel	4	9	6	9	18

Events:	1	2	3	4	5
Targets:	10	10	10	20	30
F Cass	3	4	5	10	10
O Albrecht	3	3	5	8	15
F J Crystal	8	6	6	11	12

A. A. SCHOVERLING, Sec'y.

Baltimore Tournament.

BALTIMORE, Md.—The tenth annual tournament of the Baltimore Shooting Association was held on Oct. 15 and 16. The conditions embodied a handicap by distance. A noticeable feature was the falling off in form of some of the experts. Mr. Fred Gilbert was high in the average of the target events with 190 out of 200, an average of 95 per cent.

Oct. 15, First Day.

There were twelve contestants who shot through the entire programme, a total of 200 targets. There were eight events at 15, 20 and 25 targets, and a merchandise event at 50 targets; in the latter, Mr. C. W. Hart, of Highlandtown, was first with 47 scored out of the 50, and three more straight out of the six allotted to him as a handicap of extra targets to shoot at. There were ties from the second to the sixth places, which were shot off at 25 targets, the winners being in the following order: Lester German broke 25 straight and won silver prize; Fred Gilbert, third; A. H. Fox, fourth; J. R. Malone, fifth; Dr. H. E. Lupus, sixth. The scores:

Events:	1	2	3	4	5	6	7	8	9	Total
Targets:	15	20	15	20	25	20	15	20	50	Broke.
Gilbert, 20	13	18	15	18	24	20	15	19	48	190
Fox, 19	14	17	13	20	23	19	13	18	48	185
German, 19	10	19	14	16	22	20	14	16	47	178

Oct. 16, Second Day, Live Birds.

The main feature of the second day's competition was the live bird events, all of which, however, were not shot as per the programme. The forenoon events were at targets, a total of 100, the general averages of which were made in the following order: Hood Waters 98, A. H. Fox 97, Fred Gilbert 96, Dr. H. E. Lupus and E. Storr tied for fourth on 94.

The 30-target race was a merchandise event, in which the winners were Hood Waters, E. Storr, Dr. H. E. Lupus, Lester German and Fred Gilbert in the order mentioned. The scores:

Events:	1	2	3	4	5	6	
Targets:	10	15	15	30	15	15	Broke.
Gilbert	10	15	12	29	15	15	96

Live Birds.

Enough entries were not forthcoming to warrant holding the Maryland handicap, a 20-bird event, $12 entrance, for a trophy. Dr. Darling and Hood Waters shot a race at 25 birds, which resulted in a tie on 23. In a shoot-off at 5 birds, each killed straight. Shooting off at 5 birds again, Darling killed straight and won by 2 birds, Waters losing his second and fifth. Two races, 5 birds each, resulted as follows: Waters 5, Edwards 4, Street 3, Bonday 5, Goldman 1. Second race: Waters 4, Edwards 4, Street 3, Robinson 5.

The programme events resulted as follows:

Seven live birds, $5 entrance:

Gilbert, 32	2221111—7	Fox, 31	2122220—6
Street, 26	2111222—7	Waters, 31	2222201—6
A R M, 28	1120212—6	Malone, 31	2121211—7
Darling, 29	1222201—6	German, 30	1212221—7

Ten birds, $7 entrance:

Gilbert	1221212112—10	Darling	2011111212— 9
Waters	2222111011— 9	Street	2212001112— 8
A R M	2121112122—10	Malone	2211122201— 9

New London (Ia.) Tournament.

NEW LONDON, Ia., Oct. 17.—The sixth annual tournament of the New London Gun Club closed last night. The attendance was fair, about twenty-seven men taking part in each day's programme.

The weather on both days was warm and pleasant. The shooting at targets was from one magautrap and one set of three expert traps, Sergeant system.

The programme on Wednesday was eight 15 and four 20 target events, and on Thursday was four 15 and two 20 target events; one 7 and one 15 live bird events. No money was added, but $50 was given in averages, divided as follows: $15, $10 and $7.50 to first, second and third high guns who shot the entire programme; $7.50, $5 and $5 to three high guns in target events. All target events were handicaps, 16 to 22yds., and the 15-live-bird event was a handicap, 27 to 33yds. Seven fine cups were given. Chick Ross won the cup given for county championship; Dr. Cook won the cup given for county championship on live birds; W. R. Crosby won the cup for high average in entire programme, shooting targets from the 22yd. mark and live birds at 33yds.; he was in fine form, and gave a good exhibition of what he can do with the scatter gun; Nichols won the long run cup, scoring 69 straight in the target events.

Guy Burnside was the only one to kill all his pigeons in the 15-live-bird event, and won $53 and a handsome cup. He also won a fine cigar case. In event No. 12 on the first day he was the only one to break 20 straight. McCully won the cup given for high man in the 80 per cent. class. John Burmeister won the low general average cup.

Dr. Cook, secretary of the club, had charge of all the details, and this would assure that they were ably managed.

On Wednesday evening the visiting sportsmen were royally entertained by Dr. and Mrs. Cook at their home.

Garfield Gun Club.

Chicago, Oct. 18.—The appended scores were made on our grounds to-day on the occasion of the third trophy shoot of the fourth series. Hellman won Class A trophy on 24, Tom Jones Class B on 20 and Wilson Class C on 15.

The cup shoot immediately followed, and the cup was won by Dr. Meek on 23, thrown as 15 singles and 5 pairs, notwithstanding a breakdown in his gun and having to shoot a borrowed one after first two targets.

The day was a fair one for target shooting, and the attendance should have been better. Duck shooting is responsible for it.

Twenty-fourth trophy shoot:

Pollard	0111111111011111111111101—22
Dr Meek	1111111101111111110111101—22
Wilson	1011111011011001000111010—15

Excelsior Springs Gun Club Tournament.

EXCELSIOR SPRINGS, Mo., Oct. 11.—The first annual tournament of the Excelsior Springs Gun Club closed to-night. The attendance was not as large as it should have been. The programme was a liberal one, $6.25 being added to each event. Half of the events were divided Rose system, and half on the percentage plan. Dickey magazine traps and targets gave good satisfaction. Event No. 12 on the second day was at 25 targets, open to amateurs only, for the Excelsior Springs challenge trophy. All other events were open to all, handicaps 16 to 18yds. Budd was high with a little better than 90 per cent., and Linderman second with 88 the first day. On the second day Budd and McGee tied for high guns with 90.3 per cent.

Linderman won the amateur challenge trophy with 25 straight.

The visiting sportsmen are highly pleased at the reception given them by the Excelsior Gun Club, and will all be ready to attend the next annual tournament of this gun club.

Budd won high average for the two days, with Linderman a close second.

First Day, Oct. 10.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

HAWKEYE.

York (Neb.) Annual.

THE annual tournament of the York Gun Club was held Oct. 14, under the management of F. D. Copsey and H. R. Hatfield. Attendance was not as good as expected, but it proved a very pleasant event nevertheless. Linderman, Sievers and Riehl all shot above 90 per cent., and won the honors in the order named. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	Total
Targets:	10	15	15	15	20	10	15	15	15	20	Broke.

HAWKEYE.

Fort Smith Shoot.

FORT SMITH, Ark., Oct. 15.—Mr. Frank Baptist and Mr. W. W. Webber, two local sportsmen, conceived the idea to give a little shoot here as an additional attraction to the Street Fair. Nothing pretentious was attempted, and consequently a large attendance was not expected. The shoot was a one-day affair, and the only inducements offered was $15 average money, divided $8, $5 and $2 to the three high guns. The programme consisted of twelve events, though the last was a consolation affair, and consequently did not include in the general average. Eighteen shooters participated in the various events, but only four of these shot the entire programme. High gun money was won by Frank Baptist, the local shot, by a wide margin, as he put up the excellent percentage of .929. J. M. Walker, of Spiro, I. T., was second with .806, and J. W. Bryant third with .741.

The weather was fine, and the conditions altogether ideal for shooting. Mr. Paul R. Litzke, of the Peters Cartridge Co., took care of the details of the shoot. The following are the scores:

Events:	1	2	3	4	5	6	7	8	9	10	11		
Targets:	15	10	10	15	20	10	15	10	15	20	15	Broke.	Av.

Cincinnati Gun Club.

CINCINNATI, O., Oct. 18.—The seventh contest for the Troisdorf medals, a handicap at 50 targets, had winners as follows: Class A, Randall and See; Class B, Herman. Scores: Herman (17) 45, Randall (18) 45, See (20) 45, Gambell (20) 43, Coleman (19) 43, F. Littleford (18) 41, Capt (18) 40, Kohler (16) 40, Van Ness (19) 39, Verges (21) 39, T. Littleford (16) 38, Bauer (16) 38, Block (18) 37, Ahlers (21) 37, Steinman (17) 37, Maynard (18) 36, Dreihs (17) 35, Osterfeld (21) 32, Corry (17) 30, Maybin (16) 30, Faran (19) 29, Quehl (16) 28, Jack (16) 28, Colonel (16) 22, Barker (18) 21.

Twenty-five targets, 24yds., $1 entrance, two moneys: Gambell 22, Van Ness 17, Ahlers 15, Coleman 15, Verges 15, Faran 14.

Capron Tournament.

CAPRON, Ill., Oct. 17.—Oct. 15 and 16 there was a shoot held here. The first day was devoted to live birds; second day, targets. Neither day was the attendance what it should have been, and Mr. Vance was much moved over the absence of those who should have been there, and were expected as per the understanding he had with the boys.

The birds were good and were trapped from five ground traps, and many of them will live to be trapped again, or inhabit the farmers' barns for many summers to come.

There were a few of those present the first day who did not stay for the second, as they claimed to be live-bird shots only.

Scores as follows:

First Day, Oct. 15

Event No. 1, 7 live birds, entrance $2:

Van Epps	1112022—6	Rottner	1211211—7

Malana	10001—2	Goodall	00111—3
Bruel	11001—3	Randall	02022—3
Vance	01012—3		

Second Day, Oct 16.

There were some additions to-day to the crowd, and yet it was small.

Ducks are now on the marshes, and this attracts the target shooters.

Mr. Vance was high man with 142 out of 185. Other good shots fell down. The light was bad, and the background, a green hill, that kept all guessing.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14

RAMBLER.

More About Handicaps.

IN your issue of Oct. 11, 1902, page 299, you publish an explanation from Mr. H. D. Kirkover, of Fredonia, N. Y., in which he quotes an article from Mr. Ed. Rike, of Dayton, O., taken from Field and Fancy, stating why there is nothing in trapshooting for them as now conducted.

The question of handicap is a matter that concerns thousands of your readers, and as one of them, allow me to state a few facts:

Formerly all trapshooters stood at same distance, 18 yards; later all at 16 yards for 12-gauge guns. Money was divided 50, 30 and 20 per cent. The better shots naturally scored higher than the less skillful ones; hence men like Kirkover and Rike received 50 per cent. or half of the purse—say four or five times as often as the majority of the shooters.

Soon the majority learned that they were simply "producers" or "suckers," and the attendance declined all over the country. Finally the manufacturers saw that something must be done to revive the sport and increase sale of guns and ammunition, and their paid representatives were instructed to "shoot for targets only."

Various forms of division of money were tried, but all failed to give satisfaction, simply because it was absurd and unjust to expect the majority to stand at the same rise with shooters like Gilbert, Crosby, Heikes, Rike and other experts.

Later the "Grand American" Association introduced the distance handicap—14 to 22 yards rise—and that has proved to be a step in the right direction. Mr. Shaner thought the scale should be back to 25 or 30 yards, and promised to give us his views, but has not yet done so. However, he was correct, and the experts will be placed at a greater distance later on.

Of the various forms of dividing money the Rose system has given the most satisfaction, and will remain until we become more civilized, when we will adopt the Pumphrey equitable system.

Mr. Kirkover and Mr. Rike are not satisfied because the "moneys were cut up." That is, they do not now receive the lion's share, or one-half of the purse. They do not like the novice to have an equal chance against the "seasoned, consistent performer." They do not want to put their hard-earned skill in competition with the "crude, uncertain beginner." There is nothing in the sport to them only the winning of money, and they want a sure thing of it.

For years past your paper has held up to us higher ideas of true sport. You have advocated stopping the sale of game, unreasonable bags, etc., etc., and most States have enacted laws to that effect, that the pleasure might be divided among a greater number.

What is the difference between the position taken by Mr. Kirkover and Mr. Rike and the men who shoot into a covey on the ground, or shoot for count only? Is there nothing in sport beside the money to be won, or the number of birds killed?

CINCINNATI, O., Oct. 14. FAIR PLAY.

Winchester Gun Club.

DETROIT, Mich.—The regular shoot on Oct. 18 was favored with a fine Indian summer day, and the straight score cup had another close call. In the club event of 25 targets, Shiell, of Class A, missed his twenty-first bird only. Guthard gained one point in the year's race in Class B by breaking 21. Ford, of Class C, a beginner this year, added a 21 to his very creditable string. Following are the scores:

Events:	1	2	3	4	5	6	7	8
Targets:	10	15	10	10	10	10	25	25
Shiell	..	..	..	7	7	1	..	24

IN NEW JERSEY.

Jackson Park Gun Club.

Paterson, N. J., Oct. 18.—The Jackson Park Gun Club undertook to run off another shoot at the special request of a number of out-of-town friends, and sent out about fifty postal cards, notifying that many different shooters that we would hold a live-bird shoot on Saturday afternoon beginning at 1 o'clock. We had ordered and received 400 birds, and had about one hundred on hand—quite enough for a good afternoon's sport; but to our surprise, not one of our expected friends put in an appearance, except Count Lenone and Judge Booker, of Passaic.

We delayed matters until after 2 o'clock, thinking some one would come on the next car, but only a few friends came to look on. Everything being ready, I soon got the home boys going, twelve entering for the 5-bird event. Some of the birds were too fast for a starter for most of the boys; but George Hopper and Klotze seemed to be in good form, both shooting in quick time and scoring their birds.

In the 10-bird event, there were ten entries. The boys seemed to all settle down to their work. Every one killed out in the first round. Bunn dropped a hard one in the second round, 2yds. over the wire. Three men dropped in the next round, one in the fourth, one in the fifth, two in the sixth, two in the seventh, two in the eighth. The birds seemed to get better all through the game. Eight men dropped in the last two rounds.

I am sorry that I did not take the flights of these birds, as they were an excellent lot.

Dr. Johnson proved the winner. Morgan was a close second with 9. His miss was on a lightning right-quartering bird. Five men finished in the 8-hole, with the others close up.

The third event was ready for me, and they kept right on, nine entering at 7 birds, but it was seen at the fifth round that it would be impossible to shoot the 7 birds, so the game was called at the end of the sixth round.

Capt. Powers was straight up till the sixth. He went to the score and called "Pull!" He was standing there while every one was laughing and shouting to him to shoot. The bird was a sharp left-quartering bird, very fast. He said he did not see it at all. It was all guesswork. After that it was overcast all the afternoon, but good for shooting while the light lasted.

The boys had a good afternoon's sport, but very poor encouragement from our friends. Probably it was the weather that kept them away. We will try again. Most of the boys here are tied up in politics just at present.

No. 1 was 5 birds, $2.50. No. 2, 10 birds, $5. In No. 1 Messrs. Reynor and Wiley made their first attempt:

Powers, 28	21002—3	2102221120— 8
Dr Johnson, 29	22*22—4	2211221122—10
Morgan, 29	2201*—3	1111021221— 9

DUTCHER.

Jeannette Gun Club.

Guttenberg, N. J., Oct. 17.—The Jeannette Gun Club held its shoot here to-day. The birds were ordinary. Five tied on 10 straight, and of these, Messrs. Schortemeier (Job Lott) and Steffens withdrew on the shoot-off, having already a number of wins in Class A. C. A. Meyer won in the eighth round of the shoot-off, and also won the challenge medal from C. Steffens. This now puts him in the 30yd. class. The scores:

F Ehlen, 28	1101110112— 8	C Thyssen, 25	2222212122—10
F Kastner, 28	1111002222— 8	J Mohrman, 28	1102202210— 7

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Oct. 18.—The attendance was unusually light, and only five contestants participated in the matter of the October cup, of whom Dr. J. J. Keyes was high with 48. Mr. Geo. R. Schneider was a guest, and was in the first flight as to performance. The scores follow:

Club shoot, 50 targets, handicap: Dr. J. J. Keyes (2) 48, H. M. Brigham (0) 45, W. G. McConville (4) 42, W. W. Marshall (6) 38, C. G. Rasmus (4) 37.

Match, 100 targets, all scratch: H. M. Brigham 86, W. G. McConville 86, Dr. J. J. Keyes 85, W. W. Marshall 68, C. G. Rasmus 67, C. J. McDermott 47.

Shoot-off, 25 targets, for trophy: H. M. Brigham 22, W. G. McConville 22.

Second shoot-off, same conditions: H. M. Brigham 23, W. G. McConville 16.

Match, 25 targets: Brigham 25, McConville 20, Dr. I. I. I. Pool 8.

Match, 25 targets: Brigham 24, D. C. Bennett 11.

Match, 25 targets: Pool 22, Brigham 16.

Brooklyn Gun Club.

Brooklyn, L. I., Oct. 18.—There were five of John Wright's students at the Brooklyn Gun Club's shoot to-day. Mr. Welles performed excellently well, breaking straight in several of the events, as the scores will show, as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	15	10	15	10	15	15	15	15	10	15	10	20	10

LIKE GOOD WINE

Du Pont Smokeless Powder

IMPROVES WITH AGE.

In the Hill Top Handicap, Austerlitz, Ky., Messrs. Fred Gilbert, from 32 yards, and R. S. Rhoads, from 30 yards, at fast birds, in a **thirty-three yard** boundary, each scored 46 out of 50 live birds. In the shoot-off Gilbert scored 9, Rhoads 8.

They both used shells that had been machine loaded in 1897 with **DU PONT SMOKELESS.** After being loaded **five years,** the Du Pont Smokeless won the Handicap and first money in competition with experts and fresh loads of various brands.

"MY TRAP SCORES"

WILL ENABLE YOU TO

Preserve Your Scores.

A POCKET trap score book containing 50 pages of score sheets and the Interstate Association rules for target and live bird shooting, and for shooting under the Sergeant system. The cover bears the title "My Trap Scores," and the pages, in number and form, are arranged to make a complete record of the shooter's doings at the traps. The pages are ruled to make a record of the place, date, weather conditions, number of traps, number of shooters, gun and load used events, etc. The score sheets are ruled for 25 targets. Bound in leather Price 50c. postpaid.

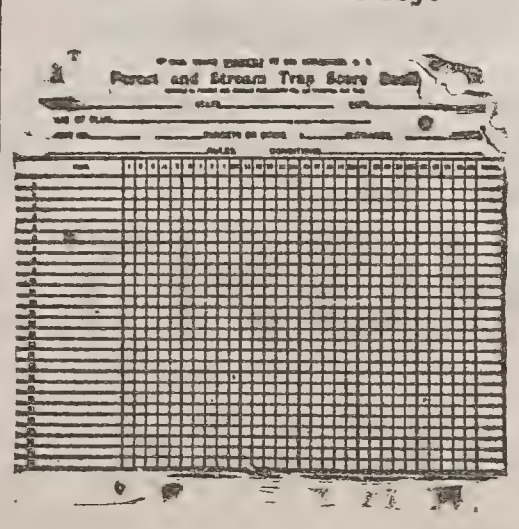
FOREST AND STREAM

Trap Score Book.

The only one containing the new (1902 revision) Shooting Rules of the Interstate Association, for targets and live birds; The American Shooting Association Rules; and the revised Hurlingham Rules. And a detailed description of all the shooting systems in practice for the divisions of money.



FOREST AND STREAM'S new Trap Score Book will admirably fill the needs of clubs and contestants in affording a means of keeping a faithful record of contests. Each book contains a generous number of sheets, so ruled as to make all the chief divisions of the shoot plain at a glance. For instance, the horizontal spaces are numbered from 1 to 27, every sixth line being distinctly heavier than its fe lows; hence the squads are distinguishable at a glance. The perpendicular spaces are numbered from 1 to 30, ample space first being left for the contestants' names and their handicap allowance. Heavy dark lines are between each five spaces, and the numerals 5, 10, 15, 20, 25 and 30 are in heavy-faced type, so that the number of targets or birds to be shot at are apparent at a glance. The heavy ruling also is an advantage in bad lights. However dark a nook the scorer may be in, no straining of the eyes or incorrect entering of scores is possible on account of inability to distinguish the lines of the score sheet. At the head are the usual spaces for current data. Each sheet is perforated, so that it can be readily torn out when manifold copies are made, and yet each sheet is strong enough to hold firmly in place if the book is desired for permanent club records. A neat pocket on the inside of the back cover holds carbon sheets for manifolding. The book is neatly and substantially bound in cloth, and contains 150 score sheets. The price is $1

FIELD GUNS.

When, 15 years ago, we introduced the light weight, short barrel 12 gauge **Featherweight Francotte Guns,** most hard practical field shooters who were lugging their 8 or 9 pound guns when following their bird-dogs, shook their heads and very much doubted that anything like the same bag could be made with these "grasshopper" or "mosquito" guns as with their heavy old-fashioned guns.

When, however, one of these full-choked little guns made highest percentage of pattern and penetration in gun trial where most of the leading guns competed and when others were winning highest honors at the trap—then, public opinion began to change. Since then thousands of our Francotte and Knockabout Guns have gone into the hands of leading sportsmen.

FRANCOTTE AND KNOCKABOUT GUNS have always kept well ahead of all competition as regards shape and model, strength coupled with light weight shooting and wearing quality, fit and finish, and the ownership of either make of gun is a testimonial as to a sportsman's standing.

FRANCOTTE GUNS, all gauges, weights, length of barrels and shape of stocks from $80.00 to $450.00 net.

KNOCKABOUT GUNS, all gauges, weights, lenght of barrels and shape of stocks, $60.00 net.

We are willing to take your second-hand guns as part-payment for new ones.

MAUSER SPORTING RIFLES, $45.00 to $50.00.

MAUSER AUTOMATIC PISTOLS, $22.65 to $25.00.

WINCHESTER

BOX MAGAZINE REPEATING RIFLE MODEL 1895.

.35 CALIBER.

WE have adapted the Winchester Model 1895 box magazine repeating rifle to handle a new Smokeless Powder cartridge, known as the Winchester .35 Caliber, which is the most powerful shooting cartridge, at both long and short ranges ever offered. Rifles for this cartridge are made with 24 inch round nickel steel barrels, and weigh about 8 1-2 lbs. The Winchester .35 Caliber Cartridge embodies high velocity and consequent flat trajectory, great energy and striking power, making it a very desirable cartridge for hunting the biggest game known. Some idea of its tremendous killing power may be gained from the fact that the striking energy of this cartridge at 200 yards equals the muzzle energy of the .45-70. This cartridge is loaded with a 250 grain soft point metal patched bullet, and special Smokeless powder, which imparts to the bullet a muzzle velocity 2,200 foot seconds, thereby developing a muzzle energy of 2,685 foot pounds. The penetration at 15 feet from the muzzle is 15 7-8 inch pine boards. Owing to their size and high velocity, .35 Caliber soft point bullets upset, or mushroom, in a most perfect manner. Send for circular fully describing this rifle.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

YACHT ARCHITECTURE.
By DIXON KEMP, Associate of the Institute of Naval Architects, and Member of Council. Second edition. Super-royal 8vo. Price, $16.80.
This work enters into the whole subject of the laws which govern the resistance of bodies moving in water, and the influence a wave form of body and wave lines have upon such resistance. It also deals comprehensively with the subject of steam propulsion as applied to yachts. An easy system for designing is provided, and every necessary calculation is explained in detail. The latter part of the work is devoted to yacht building, and engravings are given of every detail of construction and fitting, including laying-off, taking bevels, etc. The list of plates (exclusive of over thirty devoted to the elucidation of the text, and nearly 200 wood cuts) exceeds fifty, and comprises the lines of some of the most celebrated yachts afloat by the most successful builders and designers.
FOREST AND STREAM PUBLISHING COMPANY, NEW YORK.

Hints and Points for Sportsmen
Compiled by "Seneca." Cloth, illustrated, 224 pp. Price $1.50.
This compilation comprises six hundred and odd hints, helps kinks, wrinkles points and suggestions for the shooter, the fisherman, the dog owner, the yachtsman, the canoeist, the camper, the outer; in short, for the field sportsman in all the varied phases of his activity. The scope of the information it contains embraces a wild field, and "Hints and Points" has proved one of the most practically useful works of reference in the sportsman's library.

ZOO AND PARK.

THE managers of the New York Zoological Park are impatient of the popular abbreviation of the title to the "New York Zoo." They submit that the park is something quite different from the conventional zoo, and that the distinction should be given recognition in its designation. In this they are right. The park is not only different from the zoo, but it is so much superior that the old term of zoo applied to it is erroneous and belittling. A zoo as commonly known to most cities where it exists is a collection of wild animals crowded into a confined space which has been wrested for the purpose from a park area, and into which the unhappy creatures are packed in the way to get the most exhibits into the least room. Large animals are confined in small cages and pens, where they have no rest from one another, and no sufficient means of exercise. Here they are shut up year after year, victims of a refined cruelty which takes no heed of their sufferings. An elephant in the New York Central Park was for years kept chained by all his four feet to the floor, until as a matter of course he went crazy and had to be killed. "Wicked Old Tom got cyanide at breakfast," the papers reported it—a fine discernment surely, to attribute wickedness to a beast which had been slow-tortured into insanity. "The day will be long, but there will be an end of it," said the indomitable Frenchman condemned to the rack; but this poor Central Park brute in chains had not the sense to know that his day would have an end. "Wicked Old Tom" was only a type of his class. The zoos of the country are full of creatures whose captivity cannot mean anything else than prolonged suffering; and it is a curious twist in human nature that permits us to tolerate with complacency, or at best with indifference, the zoo system.

Under the conditions which have been provided at the Zoological Park, the lot of the captive animals is in large measure ameliorated. The ruminants—buffalo, elk, deer—have extensive ranges, where they may roam freely and widely. The bears are in cages of such size and construction, and in such combination with rock caves and ledges, that these creatures too have that freedom of movement and exercise which is essential to the health and physical comfort of all animals, including man. Even the monkeys are provided for after a fashion, which, while it does not give them conditions in any degree approximating their surroundings in nature, is yet far beyond the conventional monkey cage. The difference between the Zoological Park and the ordinary zoo is in short just the difference between intelligent and humane treatment at the Bronx and the stupid and indifferent abuse at Central Park. The managers of the Bronx institution may not reasonably expect newspaper editors and the public always to use the full title, New York Zoological Park, for time is precious and it is much quicker and easier to write or say zoo; but they may reasonably demand public recognition and appreciation of those improved conditions and conduct which distinguish the park from the zoo.

Putting aside altogether any humane considerations, it cannot be questioned that the observation of wild animals under the Zoological Park conditions is much more agreeable and profitable than the contemplation of them in the cages and pens of a zoo. At Bronx Park students of natural history have splendid opportunities for study; and there is so much of wild life—and natural wild life—on show there that a visit to the park may be made both enjoyable and instructive and profitable.

SNAP SHOTS.

Judging from the inquiries received at this office, we infer that there is a general uncertainty respecting the privileges of non-resident shooters and fishermen in the State of New York. The practice of Canadians who crossed the boundary waters for shooting and fishing on the New York side, when if a New York sportsman visited the Canadian side he was required to pay a license fee, naturally aroused a spirit of retaliation, and the Legislature was asked to adopt a law providing that a non-resident might not fish or shoot on boundary waters within the jurisdiction of the State except upon payment of a license fee equivalent to that which was exacted of New York sportsmen in the State or country from which the visiting non-resident had come. The measure was locally protective and retaliatory. Subsequently, at the last session, the scope of this law was widened, to apply to the entire State, and the provision was made that nowhere in New York might a non-resident shoot or fish, if such non-resident came from a State or Province which exacted a license, except upon payment of a license fee corresponding with the fee his home State or Province took from visiting New York sportsmen. The only exception was in favor of non-residents who hold real estate in New York. If then any non-resident shooter or angler is in doubt whether he must take out a license for shooting or fishing in New York, he may resolve his doubt by learning whether his own State or Province exacts a non-resident license.

Herman Schmidt, a Maryland farmer, having read in a foreign paper that wood properly prepared would make good animal food, is putting the plan into practical operation. The theory is that "animals have a decided liking for young shoots, roots or shrubs, tree bark and other heavy food of the same nature, and experiments have proved that the nutriment contained in such growth remains in it even after it has become wood, and that with a little salt and water added to it the sawdust will prove to be a highly nourishing diet. Pine, birch, alder, beech, walnut and other woods have been analyzed chemically, and the wood has vastly more albumen, nitrogen and fatty substances than straw." If the Schmidt live stock does not succumb under the treatment, we shall have here the solution of the economic disposal of the sawdust which plagues so many fishing waters, and grateful anglers will inscribe the name of Herman Schmidt on a monument more enduring than bronze.

It is the opinion of certain Adirondack dwellers that the abolition of deer hounding has largely increased the list of hunting casualties by which human beings are shot by mistake for game. The reasoning which leads to this conclusion is that sportsmen have taken to still-hunting and jacking, in both of which pursuits there is much firing by novices at objects not clearly determined to be deer, with a resulting frequency of shooting at human victims. It may be said in reply to this that jacking also is prohibited by the law, but as a matter of fact it is extensively and continuously practiced. An interesting and instructive comparison might be instituted to determine the relative human mortality in those sections of the North Woods where deer are hounded and where they are not hounded. If the districts where the hounding law is violated show fewer man killings than do the other districts where hounds are not now employed, that fact would be significant.

Another victim has fallen before the imperfect aim of the variety show William Tell. This time it was at Cold Spring Harbor, Long Island, where a fatuous grocery clerk posed for a traveling vendor of patent medicines. The reports say that the showman who fired the fatal shot has been performing the act for years. That is only to say that he should have been in jail long ago. These dangerous stage feats should be forbidden by law. There will always be found foolish creatures ready to stand up before the show marksman; they should be protected against their own foolishness. A preventive statute to this end is worth much more to the community than the findings of coroners' juries after the event.

Those Massachusetts deputies who lay in wait for the capture of a partridge snarer exhibited the resolution and endurance popularly attributed to the duck hunter or the seeker after moose or deer trophies. The Fish and Game Commission and its executive agents are demonstrating the admirable results which follow the enforcement of the law by actually going after the poachers. Under the control and inspiration of Commissioner Collins game and fish protection means something in Massachusetts. It is a pleasure to record such a piece of detective work as that which is chronicled in our shooting columns to-day.

FOREST SCHOOLS.

THE recent extraordinary awakening of this country to the importance of forestry promises much for the future of this science and the industries which depend on it.

In no way is this awakening more interestingly shown than by the establishment in various States of schools devoted entirely to the instruction of young men in various branches of forestry work. Many of these schools are admirably equipped, and all are in charge of excellent men.

The Yale Forest School, under the direction of Prof. Henry S. Graves, has recently been equipped with a new wood-testing laboratory, has a botanical laboratory and herbarium, and a wood lot of 400 acres; the whole giving a very complete equipment. The attendance this year will be between thirty-five and forty, and the force of instructors has been increased by two.

The New York State College of Forestry, under the direction of Prof. B. E. Fernow, will have seventy students this year, of which thirty are old and forty new. Eleven of these are graduates of different colleges and universities. Among the special students are one from the Philippine Islands and one from Austria.

North Carolina has its forest school, under the direction of Dr. Schenck, on the estate of Mr. George Vanderbilt, at Biltmore. A new building devoted to the forest department of the Biltmore estate, as well as to the Biltmore school, has been recently completed. Mr. Ernest Bruncken, of Milwaukee, Wis., formerly Secretary of the Wisconsin Forest Commission, has been added to the staff of instructors at Biltmore. It will be remembered that last spring Dr. Schenck took a party of seven students from Biltmore through the forests of Germany and Austria.

A forest school has been established at the University of Nebraska, and has been put in charge of Dr. Chas. E. Bessey, so well known as a botanist and a student of forest matters. Although just starting, it is not to be doubted that the interest here will grow rapidly.

In Michigan, one of the greatest of lumbering States, forest schools have been started in the University of Michigan, at Ann Arbor, and at the Michigan Agricultural College at Lansing. The course at Ann Arbor is open only to students who have received a bachelor's degree from some college or university, and covers two years' work in forestry.

Meantime the Bureau of Forestry in Washington is doing all in its power to arounse interest in forestry all over the country, and to make easy the planting and culture of forest trees, as well as the protection of forests already in existence; while the New York Forest, Fish and Game Commission has determined to establish a State nursery for the propagation of seedling trees, which are to be used in reforesting areas in the State forest reserves which have been swept bare of their timber.

All these are encouraging signs of the times, and taken in connection with the constantly growing interest in irrigation, promise much for the future. Meantime, however, it is to be said that the care of the forest reservations in the West leaves very much to be desired, and, in fact, in some localities is reported to be deplorably neglectful.

A RECORD OF THE OLD MISSOURI.

A FEW years ago there was picked up, about three miles west of Mandan, North Dakota, by a party of surfacers on the Northern Pacific Railroad, a fragment of clay rock, on which had been scratched a number of names. The stone is yellowish brown in color, about 7¾ inches long by 5 inches at its widest part, by 1½ inches in thickness. It is too hard to be scratched by the finger nail, but soft enough to be readily cut by a knife. It appears to be a river-worn boulder, quite smooth on one side, but a little weathered and roughened on the other, which has apparently been uppermost in running water, and so is pitted and roughened by the impact of small stones and particles of gravel passing over it for a long time. As seen in the engraving, fragments have been knocked from the surface in several places, leaving smooth faces, which bear the interesting marks.

On the smooth surfaces, which have been apparently protected from wear, are engraved a number of names: "H. C. Dent, Ind."; "Shrope, 1849"; "Clark," "Bennett," "Mooney, Mo."; "D. Russell, N. Y."; "Hedden," "No-

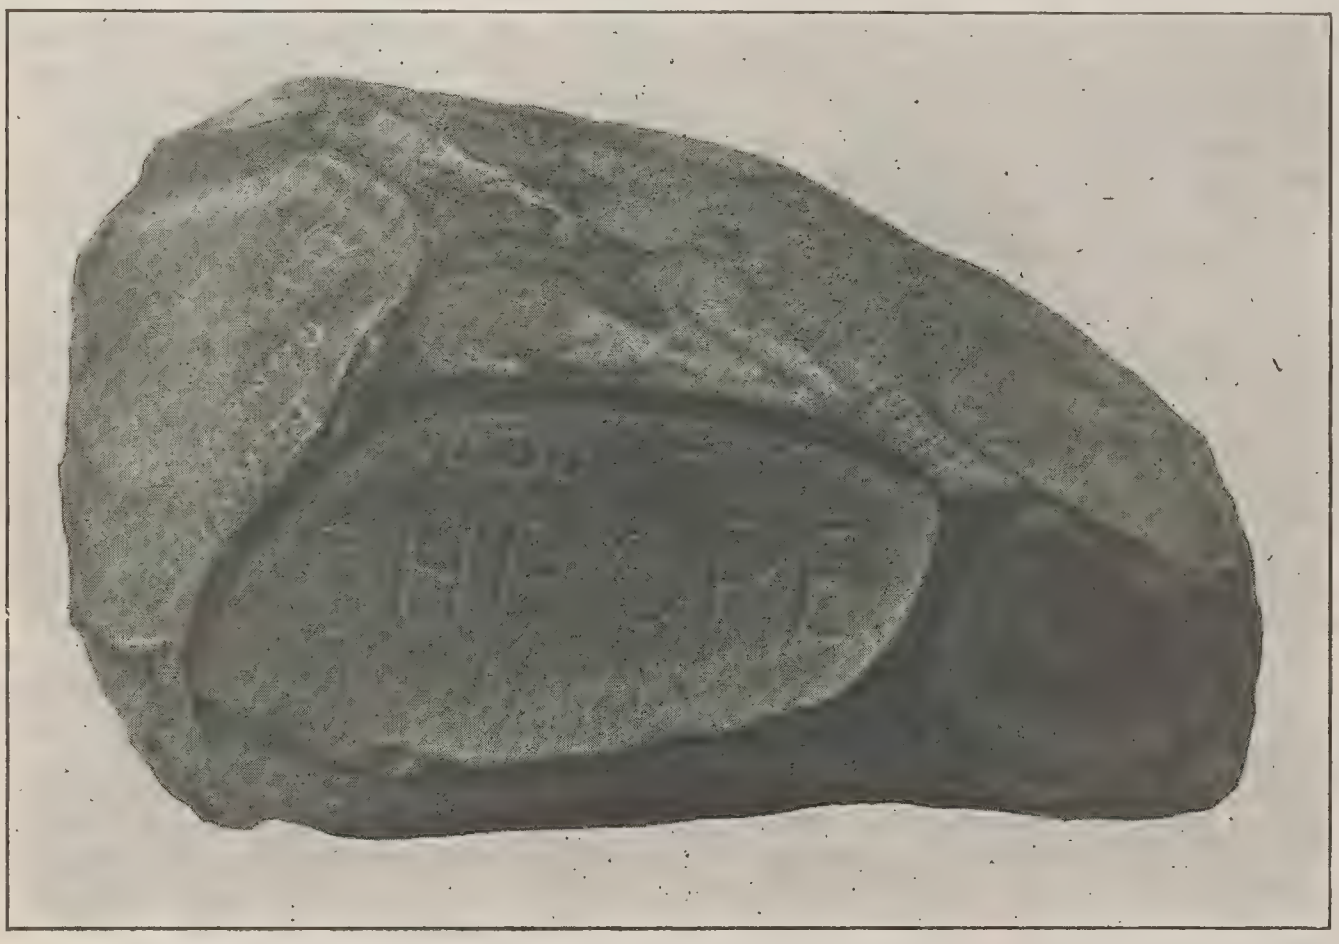
lon," "Illingworth," "Leland," "Judson," "Kid," "T. D.," "DiR.," "M."

On the pitted or roughened surface are the letters "McCa," apparently the beginning of the name McCarthy or McCann, the last letters having been worn away by the weather.

Here is the apparent record, seemingly more than fifty years old, of some party of travelers—hunters, trappers or traders—who once were encamped on Heart River, near its junction with the Missouri. Who they were and what was their purpose in the country we cannot now know. Long before this date, trading posts had been established far up the Missouri River, and travel on the stream was now more or less regular. Yet—except for the fur traders and their engagees—the travelers to the more distant west passed further to the southward, since most of the trails to the Rocky Mountains, traversed by traders, trappers, explorers and missionaries, started out from Independence, Mo., and for a time followed the old Santa Fé trail.

It will be remembered that about 1833 there was established on the east side of the Missouri River, about where Bismarck, the capital of North Dakota now stands, a trading post known as Mitchell's Post. It will be remembered also that there were various forts then chiefly owned by the American Fur Company up and down the river on both sides. Further, to any one traveling up or down the Missouri, Heart River offers a natural stopping place and camp ground. In old times there was at the mouth of this river an Aricara village, the remains of which are still visible.

It is perhaps fair to infer that the men whose names are inscribed on this stone were employees of the American Fur Company, but where they came from or what they were doing we do not know. Can any of our readers help to read the story told by this stone?



A RECORD OF THE OLD MISSOURI.

The stone is now the property of Major George H. Bingenheimer, long a resident of Mandan, North Dakota, and for several years agent of the Standing Rock Indians. It is to his kindness that the FOREST AND STREAM owes the opportunity of seeing and illustrating the relic.

The finding of this stone was a most extraordinary happening. Here was a common enough fragment of rock, hardly a bit of gravel, for it is too large; certainly not a boulder, for it is too small. In an idle moment, these men scratched their names upon it and then thoughtlessly threw it away. Later, some freshet on the Heart River carried along this and a million other similar pieces of stone, and heaped them up in a gravel bank, where this one may have lain buried for nearly half a century. Meantime, the old fur company had gone out of existence; buffalo and antelope and Indians had been swept away; the railroad had come; white settlers had filled the country. Then followed railroad plans for a change of grade, the choice of this particular gravel bank for filling, the steam shovel, and the transfer of many tons of gravel from one point to another. In this transfer, the stone was moved, came to the surface and happened to catch the eye of some one who could read the markings it bore. There was not one chance in a million that this particular stone should reach the surface, or, if it reached the surface, that it would fall under human eye. Yet it did so, and now its picture goes forth to the world, carrying the question, Who were the men who carved their names on this imperishable register?

The register gives us much information. There are the names of the signers, the States in which some of them resided, and a date. It is entirely conceivable that some member of this party may still be alive and may see this note, or if not that, perhaps some descendant of a member may see it and may be able to tell our readers something of the matter.

The Sportsman Tourist.

Sunday at the Cabin.

(*Continued from page 330.*)

MANY summers ago a small boy went to visit his relatives in Connecticut. The trip was a delightful one. There was New Britain with its teeming industries, Hartford the beautiful, quaint Weathersfield with its onion patches and truck gardens, above all the lovely Connecticut valley dotted with farmhouses and meadow land, musical with the low of kine and the whetting of the scythe, redolent with the fragrance of June—the fragrance of new-mown hay. All went well enough until Sunday came. Now at home one Sunday was no sooner ended then the dread of its successor began, but this Connecticut Sunday capped the climax. Great were the preparations therefor—the sweeping and dusting, the cooking and baking, the doing of all possible chores that might eliminate labor as any factor in its observance. Soon after Saturday's sun had passed the meridian shadows of the levitical Sabbath commenced to forecast themselves. Clean clothing was laid out; the head of the house shaved himself, and the weekly bath was indulged in by all members of the family. Books and newspapers were laid away (locked up, I believe), save the Bible, the Independent, the catechism, and the nauseating "good child go to heaven," Sunday school literature that obtained a generation since. Saturday evening was but a foretaste of the morrow. There were no games, no conversation on secular topics, no books that any sensible child would care to read. There was a preview of the Sunday school lesson and an unusually long supplication at family prayers. I really believe that everyone rejoiced when bed time came.

A glorious Sunday dawned. It was heralded by birds that carol their Maker's praise for seven days in the week without regard to creed or catechism. The perfume of the roses floated up to my window. There was no restraint upon their blooming. Kind Nature puts no sabbatical stint upon her bounty. It was just the day for a ramble in the woods; but, no! The very mention of such a thing would be considered sacrilegious. There were prayers, and a breakfast that would have been cold had not coffee and oatmeal removed the curse. Then came the preparation for meeting—a long, long service, with a very dry sermon. I wondered if people in the old pillory and stocks felt the way that I did for a couple or hours. Sunday school occupied the time for another hour and a half. Then we made way with the cold lunch, by courtesy termed the Sunday dinner. According to the laws of hygiene it was eaten altogether too hurriedly, but the afternoon service began at two o'clock. This was a repetition of the morning's ordeal, only a little more so, for I was more tired. After the benediction we went back to the farmhouse, now as bleak and dreary as a winter funeral. Uncle doled out the literature appropriate to the day, and then proceeded to read a sermon from the last Independent. The juniors took their good books like good children. When I was unobserved I stole off to the barn to speculate as to how long it would take a "highholder" to peck through a dry limb, or whether the honey that the bees gathered from the sweet peas tasted the same as that obtained from clover blossoms. Coming back to the family group I found the children looking anxiously toward the west. Never did sun decline more slowly. At length its rim touched the hills; down, down, out of sight! Then my uncle arose. It was a signal, and dense powder is not more instantaneous in its action. There were smiles on every face. Story books and dolls were brought from concealment. The larger boys went to their milking or to see their best girls. Uncle vanished to talk over the crops with a neighbor. The Sabbath was ended.

Train up a child in the way he should go, and when he is old he will not depart from it. Evidently the wise man did not practice what he preached, for but few of his numerous posterity were any credit to their royal sire. The fact is, overmuch preaching generally produces negative results. When the proper time came I went to a New England college. It was before the happy day of electives, and, of course, chapel attendance, especially on Sundays, was compulsory. Sunday morning is always the best of the week for sleep, and many a youth ran across the campus donning collar and cravat, or running his fingers through his wet, uncombed hair, lest the last stroke of the bell should find him outside the chapel door, and uncertain what excuse to render "prexie" in the morning. Then, indeed, Sunday afternoon was the time to wander amid green fields and beside still waters. All college boys have "cousins" to be visited occasionally and conveniently, and if, when I obtained a Sunday's leave of absence, my cousins proved to be a botany can and a fishing rod, who will cast the first stone at me?

Later on six days out of the seven were given to hard grinding in Gotham. Sunday demanded recreation. I would not shock the home folks by absolutely refusing to go to church and Sunday school, or by reading a Sunday newspaper, so I usually visited a friend. In spring and autumn the Hackensack marshes and Orange Mountain were the attraction. But in summer, after the long, sweltering week, what could be more enjoyable than to take the Mary Powell on Saturday afternoon and sail up to Pougekeepsie? From this point one might ramble up or down the river, but I preferred crossing to New Paltz and enjoying the shades and scenery of the Shawangunk Mountains and Walkill Valley. A delightful stroll was from New Paltz to Cornwall or Newburg. This may be done leisurely in a day; with long rests to thoroughly absorb the ever-changing panorama. The West Shore road was not built then and there were no magnificent country seats and villas on the west bank, though the opposite side of the Hudson, as far up as Peekskill, was experiencing its first thrill of popularity. Old-fashioned farmhouses, dating back to colonial days, old-fashioned hospitality, old orchards and older legends gave a charm to Ulster, Delaware and Orange counties that I am afraid has long since departed. Except at a country tavern it was useless to ask to pay for bread and milk, berries and cream, or any other light lunch that a loiterer might crave. Somehow those Sundays along the Hudson are canonized by time, and a halo of perfect peace crowns their memory. Since then it has been my custom to spend Sunday in communion with Nature. Yet, even now, I sometimes pause with my flies just dropping on a mountain brook, pause with a start when I remember that I am fishing on the Sabbath, and I fall to wondering if—simply wondering; that is all. And after these years I can look back and say that I believe that my Sundays have been more happily and much more profitably spent than had their sacred hours been devoted to listening to homilies on predestination, or to futile efforts to prove that Darwin, Huxley and Spencer were inspired by the devil, and that the tendencies of modern thought and modern life will soon bring upon this unrighteous generation the judgments of Sodom and Gomorrah.

This is a long preface and somewhat of a digression from the caption. I do not want any of my clerical brethren of rod and gun to consider me a heretic or an unbeliever. But my experience has been that "as the twig is bent the tree in inclined" sometimes, and it does not pay to be too hard with boys that have ideas of their own, even about remembering "the Sabbath day to keep it holy."

Two years of strenuous life under a tropical sun gave choice between a change of scene or an untimely grave. I preferred the former alternative and my heart inclined toward the mountains that I love. High up in the Wasatch a little creek, upland valleys, rugged cañons and a sunny cabin offered all I wanted. The hills over which the sun rises separate me from the Strawberry reservation; the high peak behind which it goes to rest from the farm life of Utah valley. In an air line I am not more than six miles from a town of 7,000 inhabitants. Fortunately the mountain is practically unscalable, and so I am twenty miles, by trail, from the cares of business life. When the wind blows from the right quarter, which has been only once this year, the echoes of distant factory and locomotive whistles remind me of the world outside.

A Sunday in June! The sun peeps into the cañon and kisses the white veil from the tender grass. Then little films of mist commence to climb the mountain furrows. They sail over rolling foothills, but yet half-clad in Nature's gorgeous livery, up through new-leaved oaks and maples; higher yet, to where the white-stemmed aspens are just showing the first tinge of green. They are lost in the tops of the somber pines, and, when they find themselves, they mass, rank upon rank, against mighty walls of snow and ice that will not yield to any but midsummer sun. Higher, yet higher, till they reach the crest, more than a vertical mile above their cradle. Then with one exultant bound they clear the earth and, white as the snow beneath, launch in the ethereal blue, proclaiming a new day is born. And the loving sun, who called them into life, sees them and draws them to himself, until they melt and vanish beneath his warm caresses.

"Sweet day, so cool, so calm, so bright,
The bridal of the earth and sky,
Sweet dews shall weep thy fall to-night—
For thou must die!"

Now a spring morning is not one in which a healthy man can sit idly in the cabin with melancholy and ashes for his boon companions. The shadows on life's dial turn backward a score of years. There is keen stimulus in the air. It sharpens every sense and quickens the pulse. A rugged trail leads to the mesa, where one may view the landscape o'er and quaff the inspiration of the day. The birds have chanted matins and now they are too busy with domestic affairs to pour forth the music that erstwhile filled their souls. Over a mountain torrent a fallen maple makes a bridge. The water, fed by melting snow, is as unrestrained and tawny as a lion.

It licks up the earth, plays with the boulders, and carries its rich booty down to the meadows, miles upon miles away. Where now it rules another month will show a dry arroya, where great rattlers sun themselves and tiny lizards play.

The hepaticas, wake-robins and showy orchis are wanting; nor is there oxalis or arbutus, azalea or laurel. But there are violets and adder's tongue, with mottled leaves, to remind of the eastern flora, while dwarf astragalus and a dozen species of the borrage family flaunt themselves in every direction. Here the bench-land stretches about us, level as the prairie. It is a huge triangle, with base resting on the lower mountains, and sides formed by ravines that deepen, though they become less steep toward the apex. Encircling it is an amphitheater of hills, the only opening being the main cañon, toward which all mesas point, into which all side gorges open. To-day the bench is carpeted with young lucerne and a "nurse" crop of barley, the two greens blending beautifully. It is a dancing floor on which numerous cock grouse are performing minuets to the admiration of their prospective partners in hymeneal bliss. They are tame enough now, but after the young broods are hatched and the males return to lives of celibacy, he will be crafty indeed who can get within gunshot without flushing them. So, too, the rabbits seem to know that they are safe, and bird and beast alike invite the companionship of man.

As the day advances breezes from the snow banks cease to blow, and for the hour ere the up-cañon wind begins the sun asserts his power. A cowpath leads downward to a shady brook that sings season after season. Its banks are mossy, but here and there receding water have left small tablets of mud on which mink, wildcat, fox and deer have each inscribed an autograph. Petals of haw, of choke-cherry and service berry fall on the stream like snow, and the budding brier begins to send out delicate perfume. Under overarching boughs and in rocky pools are trout galore. The water is not yet clear and almost any bait will tempt them, but spawning is only fairly underway, and it were a shame to fish at such a time. Every bush and tree has its half-finished nest. It must have been amid such scenes that Izaak Walton wrote:

"I in these flow'ry meads would be;
These crystal streams should solace me;
To whose harmonious, bubbling noise
I with my angle would rejoice;
Sit here, and see the turtle-dove
Court his chaste mate to acts of love.

"Or, on that bank, feel the west wind
Breathe health and plenty; please my mind
To see sweet dew-drops kiss these flowers,
And then washed off by April showers;
Here, hear, my Kenna sing a song;
There see a blackbird feed her young.

"Or a leverock build her nest;
Here, give my weary spirits rest,
And raise my low-pitched thoughts above
Earth, or what poor mortals love;
Thus free from lawsuits and the noise
Of princes' courts, I would rejoice."

From noon to twilight is short time in cañons such as these. First come the lengthening shadows; then the chill that says, "It is not summer yet." Birds begin their vesper chimes, and, ere the cabin is reached the sun has dipped behind the western peaks, leaving a ruddy haze on all the land, and this fades out, through purpling tints and pink and apple green, to pearl and ashen gray. Anon the stars come out, slow, one by one; the warbler's note becomes a plaintive chirp, then dies away, and tired Nature, her day's work well done, lies down to pleasant dreams.

With many-colored palette midsummer comes to change the picture. Over naked mountain tops a golden ball rolls into a cloudless sky. Bird, beast and fish, great tree and tiny plant alike have filled the law of their existence. Now is the Sabbath of their lives when they may rest and with their great Creator say that it is good. They rest happy in that which is accomplished, fearing naught of what may be. On the bench the lucerne has purpled for its cutting, and the yellow, bearded barley awaits, with drowsy head, the reaper's blade. The vivid green of spring has assumed a sober hue, and the berries are beginning to blush with thoughts of their own maturity. Among upland oaks the grouse leads here mottled brood, and when alarmed the fledglings run to cover as fast as their small legs can carry them. But their cousins, the ruffed partridges that live along the stream, squat when they hear the mother's warning "cluck," and sit motionless until the same voice reassures. Only their sparkling eyes give sign of animation. This is the season when doves gather in great flocks and meadow larks come up from the hot valleys to pastures new.

But most of life is found along the brook. Here in the heat of day come hundreds of cattle, with a score of brands and earmarks, come from the dry hillsides where they feed. Wild are they as the deer, and the cows all cache their young calves while they come down to drink. Overhead the squirrels are chattering, but they always manage to keep out of sight. Song birds are silent. With noiseless wing they flit about and undismayed survey the stranger. Lusty trout sun themselves in the riffles, then return to the seclusion of the deepest, coolest pools. The water is clear as crystal now, and bait has not been invented that can entice the fish at this season, but the proper flies—small, delicate, well handled—will work wonders at any hour.

The heat of early afternoon provokes a dreamless sleep, and, later on, the human part of cañon life displays its sociability. Some kind-hearted neighbor woman, down the road, sends word that she will make ice cream at four o'clock. Naturally that includes cake, pie and fruit, such things as seldom grace a lone man's board. So we meet and enjoy church, lodge and picnic, all combined; talk crops and politics, business and sport, till the shadows warn that it is time for nightly chores, and thus the Sunday passes happily away.

Gray and cheerless the morning! Clouds hang low on hills already whitened by the first snow. Even the sun seems sad as he looks, belated, upon the cabin roof. Chill are the winds, and they sing a doleful song.

"There was no bird, no bloom up the bowers,
The spiders spun their thin shrouds night by night;
The thistle-down, the only ghost of flowers,
Sailed slowly by, passed noiseless out of sight."

Aspen branches are bare, but the ground beneath is yellowed with their sere leaves, now the sport of every idle breeze. Only oaks and maples show the brilliant hues of autumn, and their gay colors are out of place on such a dreary day. But the crackling of cedar and glow of oak on the hearth will soon dispel the gloom and make bright the inside of the cabin, no matter what the weather out of doors.

Long before breakfast is ready the harsh chatter of a magpie comes from the ridge-pole. We never see magpies in the cañon in spring and summer, but in the fall this is the rallying ground for the clan. The bird life has changed completely. Doves leave early in September. With them go the thrushes and other songsters. Robins innumerable take their places. This particular magpie is waiting for his breakfast, too. If it were not for studying his antics there would be a cold-blooded murder. For hawks and magpies I have no mercy. A magpie will destroy, in one season, half a bushel of the eggs of better birds, and as for hawks—their depredations are even worse. But I have a dog, a timid little lady, who will let Maggie take the meat from her very teeth, and then run whimpering to me for protection, except when her puppies are around. Then there is a lively "scrap," in which the dog always comes off victorious.

A shadow darts by the window. There is a crested bird on the ground, hopping about after crumbs. Surely I have seen him before, but he is a stranger here. I go to the door for closer observation. The rascal flies to the nearest tree, whence he hurls jaylike epithets at me. Companions join in his insults. I refuse to be blackguarded in any such a manner, and the cause of science must be upheld. There he lies, with plumage scarcely ruffled by the No. 12 shot, ready for knife, brain-spoon and arsenical soap! He is the long-crested jay (*C. stelleri macrolopha*). The margin of my Ridgeway shows that I had met him before in the Buckskin Mountains of Arizona, in June, 1895. By the way, I find my bird notes better than even a camera for recalling scenes and events. Lewis' woodpecker is a common autumn visitant, and once this fall I saw a real catbird. Catbirds were also seen in Utah Valley, in the spring, by ornithologists who were raised in the East and who could not have been mistaken in the bird; so its territorial limits will have to be extended. I believe it to be the latest immigrant from the other side of the continental divide.

After breakfast a walk is in order; not on the bench. That is a maze of stubble and rowen. The chickens have all been shot off, or have bunched in the friendly shelter of the pines. But the brook still sings, although the time of fishing has long since passed, and here nature fondly clings to the little that is left of life. Under the haws the few remaining partridges feed on decaying berries, and scratch amid the crackling leaves to find a richer diet. As the sun comes out more brightly and an almost Indian summer haze enfolds the earth, the squirrels leave their nests and, lying prone upon some swaying bough, enjoy the genial warmth. A toothsome dish these squirrels make when properly dressed and cooked. They are clean feeders; yet the ranchers hereabout, who live nine months out of the twelve on rancied bacon, assert that they would as soon think of eating rats and mice as the flesh of squirrel. Once this summer, while on a dusty, open trail, I spied a squirrel coming toward me. Fortunately I had no gun, so I stood motionless. The squirrel came within a half a dozen paces before he was aware of my presence. Then he stopped short. His tail, that was flat and prostrated, now stood erect, and bristled like a wire brush. Seeing no sign of life he stole nearer, stopping every few steps to gaze at the strange object. At length he reached my feet. He climbed over my boots and smelled of them. I believe he would have tried to climb this new species of tree had I not moved my head slightly to observe his actions. That settled it. He ran off a few feet, halted for a farewell glance, and then disappeared in the underbrush.

Noon! It is time to sit upon some moss-grown log, and rest and think—think not of the future but the past, for this is the season of dead hopes, of dreams unrealized. Yet in the autumn chill Nature will breathe her gentle spirit into all who stop and commune with her. Where did Moses learn his lesson of meekness, Gautama his lesson of self-sacrifice, Jesus acquire his boundless love, but far from haunts of men? And, being far from men, they learned to love them more and to become the greatest helpers of mankind. Under the Bodhi tree, in the Wilderness, by Walden pond, the mere place matters little; the inspiration and the blessings are for all who seek. Man grows more manly, aye, more divine, each time he lets sweet Nature's teachings sink deep into his soul; and in his heart a new life burns, and on his face a new light shines beneath her heavenly influence.

The day wears on. Clouds hide the sun, and cold winds wail among the barren branches. Softly the flakes of snow descend to shroud a dying world. The leaves that, in the morning, clung with tremulous grasp to withering supports now rustle in my path. The birds have flown to warmer climes. There is no fire upon the hearth. I saddle my horse and bid farewell to the cabin forever.

SHOSHONE.

There is a plant, popularly known as "sheepweed," which grows in great profusion around sheep pens, hence its name. This weed is possessed of decidedly poisonous or at least deleterious qualities, and the Indians gather a quantity of it and set it afloat on a pool in the river, and standing down stream from it they thrash it with tree branches until the juice exudes and becomes mixed with the water. The result is that every trout for a hundred yards or so below that point is "doped" or stupefied and rendered helpless and an easy captive.—San Francisco Examiner.

Diana Visits the Farm.

PRINCE EDWARD ISLAND, Aug. 24.—*My Dear Nimrod:* We had rather an unpleasant voyage on account of the thick fog which set in soon after leaving the harbor and continued to the end of the trip, but the sail down the harbor was delightful and I saw a number of interesting things, one of which was a six-masted schooner with her sails filled by the breeze, sailing into port.

We arrived at Halifax Sunday night and left early Monday morning. When I awoke we were at sea again and the ship was rolling considerably, so that I felt disposed to remain quiet, although I was not sick. The fog was very thick, so that there was nothing to be seen but gray, above, below, and all around us. We reached Charlottetown about 4 o'clock Tuesday morning, and after breakfast took a walk about the city. At 3 P. M. we took the train for the Mills, thirty miles from the city.

This is a delightful place. The farm contains three or four hundred acres, and Uncle also has a grist mill down in the valley on the brook, or little river, and the house is on a hill near by.

Tuesday night we walked down to the brook and watched the water flowing over the dam, and saw a most beautiful sunset, all gold, and red, and purple. It was very quiet except for the sound of the water. As we sat there on a pile of logs we saw seven, then two, then five black ducks fly over our heads quite low, also two cranes, and Uncle says the woods are just full of rabbits and quail. He says the rabbits are quite tame, and come out often in the evening. He never shoots them, but likes to watch them about the woods, though the folks kill quail for the table in the fall.

The fishing is not just what I expected from the report of last year. The trout are not so large, although in June a good many were caught weighing from two to three pounds. We fished all day Wednesday, but only caught about fifteen. They run from seven to twelve inches, and are just darlings in shape and color, the spots are so bright and their dear little bellies are a beautiful salmon color.

Thursday it rained all day in showers, but your Diana was out just the same and got wet to her skin. Friday was a beautiful day, and I was up very early and out by the dam, fishing long before breakfast, and had half a dozen beauties by half-past seven. In the afternoon I had become tired fishing in the same spot all the time, and made up my mind to do a little investigating and find out where the water came from; so I walked along up the road by the side of the little river till I came to a place where it ran under a bridge, then I left the road and followed up a most delightful little stream something like our Nineteen-Mile Brook, and I dropped my line in and out came a little jeweled beauty, and in about twenty minutes I had half a dozen.

Saturday was another lovely day. In the morning we caught twenty-two trout by the mill and sent them to the village to a friend, and in the afternoon we got eighteen from the little brook, and to-morrow morning I am going up there the first thing and try some flies. Yesterday I came to a shallow place in the brook and saw hundreds of trout all headed up stream under a big tree overshadowing the water, and I dropped in a nice fat worm and a big trout made a rush for it, and I lifted him up to land him when he dropped back into the water, and do you know I just believe he told all those other fish that the nice juicy worm had a hook in his head, for not another bite did I get from that spot. In another shady place I caught four and lost two. Indeed, the ones I didn't land were many, and if you were with me, Nimrod, you would have just enjoyed yourself laughing at me I know. Please tell me the why of this. I saw a big fellow about fourteen inches long in the big pool at the foot of the dam yesterday morning and dropped in a nice bait right in front of his nose, and he wouldn't take it, and wouldn't budge an inch, just kept his tail wiggling all the time, till I got tired trying to tempt him. Now why wouldn't he bite do you suppose? He couldn't have seen me, for I was leaning over a log fifteen feet above him.

Last night was delightful, and I wish I could paint a word picture for you, but as I am not gifted in that line my description cannot half do justice.

It was sunset, and the sky was most beautiful, with brilliant colors. Just to the south was a mass of black clouds, from which the lightning flashed, showing a storm in the distance. The sky was reflected on the water and hundreds of trout were jumping, some of them away out of the water. Not a sound was to be heard except the music of the water flowing over the dam, and the old gray mills added to the beauty of the scene. It was just perfect, and I do wish you might have enjoyed it with me.

I must tell you about Monday, the best fishing day I had. We were to start for town in the afternoon, and I wanted to try the brook again; so I was up very early and started off alone with my dear little rod, a can of worms and some flies. I turned off by the brook and thought I would try a fly. I intended to wait until I got to the head of the stream and fish down, but I came to a nice little pool under a big tree and just couldn't resist the temptation. I didn't have very good luck, however, with the flies, either I didn't cast right or the hooks were too small, probably the former was the real reason, for the trout would make a rush for them, but I couldn't seem to hook them. I managed to get two nice ones, however, and was proud enough of them, as they were my first fish caught in that manner.

Then I started off through the woods again until I came to a natural fall of water over rocks formed like steps just beside another dam, and the water was pouring down, forming a great pool at the foot of the dam. I climbed down the steep bank about half-way, and putting on a nice big worm, let it drop into the pool. In an instant a great salmon-colored trout had it, and as I landed him my rod bent like a bow. He was a foot long, and as fat as butter. That was the largest one I caught, but I landed seventeen out of that one pool as fast as I could bait my hook, beside a lot of small ones which I put back. I didn't land every one that took the hook, but nearly all. Then I cut a branch and strung the little dears on it, and started down the stream. I had one big fellow landed and he gave a jump and landed himself back in he brook, and I saw no more of him. In another place under a big rock I took ten more,

and I made up my mind to send them all to you if I could manage it, but they said at the house that I could not possibly do it as the weather was so warm and the distance so great. I was dreadfully disappointed. I fished until noon and had thirty-eight. Uncle said: "That's a good catch, but last year they ran about as big as your largest one." I was satisfied, however, and pretty proud of my morning's success. I don't exaggerate one bit when I say there are thousands of trout in that stream. The folks about here don't think as much of the fresh-water trout as they do of the salt-water ones caught in the river below the dam.

I am going back to town now, and leave to-morrow for home. I shall be glad to get back only for one reason. Can you guess? DIANA.

Pacific Coast Items.

NORDHOFF, Cal.—Whatever may have been the case in other parts of Ventura county, the first day of the quail season passed off very quietly in the Ojai Valley, and though it is now the second week in October, they are still comparatively fearless. The pot-hunter has found that the coveys here escape to the hills on the first or second flight, so he hunts where extermination can be more readily accomplished. A hunter can have good shooting, though if he hunt along the base of the hills in the afternoon, at which time the birds come down on the level to feed, as by walking fast he will have continuous sport till nightfall. Residents who have lived here a long while say that the quail are finer and more plentiful in the Ojai at present than for years.

Over abundance of this game, however, is declared to have caused a protest in various sections against the law as now enforced. Many of the ranchers in the northern part of Santa Barbara county, so the game warden tells us, complain that their late grain crops and the vineyards were injured through September by quail, and ask that the season be made a month longer. It would be unfair to discredit this reputed sentiment, there being no other means to establish its truthfulness, but there must have been a recent change among he ranchers, for all of them used to be on the alert to protect their quail. When your correspondent made a trip up that way late in August two years ago, though he was not at all disposed to violate the law in any manner, acquaintances warned him at every turn that he must not dare to shoot quail, that every person within miles was on the lookout, and the most conspicuous objects he observed were the trespass notices. Some of the ranchers may feel aggrieved now that the warden has also watched them closely.

Though in rare instances complaint has been made with regard to the stringency of the protective law and the expense of employing wardens, so far as an observer can judge there exists a sentiment nearly unanimous throughout southern California favorable to close preservation of game and its propagation, or to stocking the suitable waters with fish, for climate and other features here actually compel hunting of every sort and whipping the streams. The few ranchers who wish a retrograde policy adopted that would soon mean the loss of these amusements, if they realize how strongly the country boy or the best hired help is attracted to city employment, should rather try by every means to make ranch life enjoable. A more intelligent feeling is noticeable in the Ojai. Nearly every rancher or his son is a crack shot. Homes seem private armories. What that up to date rifle or hammerless has accomplished with game would astonish you.

Remoteness of our place from the ducking country makes news concerning that class of sport hard to obtain. occasionally some minor item comes to hand. Early in the summer one of the Los Angeles clubs with privileges on the coast had to pay for flooding celery ranches near its preserve, and for a while it looked as if all the clubs would be compelled through the courts to come down heavily, but a compromise must have been effected, as no more suits have been reported. Preparation for the season had been made by sportsmen and the counties. The latter appointed a great many additional deputies to serve where most likely to be needed. The best duck shooting will not come until severe weather induces migration south.

The State hatchery of California has been engaged for the past month in distributing black bass for propagation. Lots are not large in number, but the average length is better than six inches. Consignments have been made in many instances to the different protective associations that these might place the spawn in suitable water. The club at Arroyo Grande, in San Luis Obispo county, retained a few fish of its consignment to show at the local fair and turned the others loose in Black Lake, near town. The shipment to Needles went into the Colorado River at a point near the Santa Fé bridge. Our southern waters contain only trout spawn, for minnows and frogs are scarce; only a few fish are being introduced at any one point; otherwise the conditions are favorable for the present effort at stocking with bass. The pool-like formation of all California water courses would seem a great advantage.

Result of bounty legislation has now caused no little consternation in Oregon. Mandamus proceedings will soon be begun in Klamath county, just north of the California line, to compel payment of a five-dollar bounty upon five hundred coyote scalps held in the clerk's office. These claims had always been allowed, but the Superior Court at its last session, despite a ruling of the lower court, ordered the county clerk to issue no more warrants after September, hence the basis of contention. Refusal to meet this class of debts, not only in California and Oregon, but throughout the West, indicates that bounty legislation is impracticable for its purpose. Your correspondent hopes that it will never be tried East, with such useful creatures as hawks and crows.

So far as the Ojai Valley is concerned, the coyotes were never more plentiful, not even before the bounty law had been enacted, and though rarely seen through the day, they rend night with their shrill outcries. One band gathers at evening a mile west of town to salute the train, as though this were a newly discovered member of the family, and imitate the shrill whistle. Very little trapping is done in the valley; but more violent means are often adopted. Robbed poultry fanciers will butter aged hens with honey and strychnine, then in the morning look for agonized tracks. A coyote seldom dies near the sham hospitality, but driven onward by disgust, he makes the mountain; or should he not die at all, little brother avoids forever man and a chicken. The average size appears to be greater here than it was in Nebraska.

This country has about as many kinds of small animals as are found along the Atlantic coast. Chipmunks, red squirrels, tree rats, the last nearly allied to the squirrel family, will be met with about brush or timber. The little brown civet cat, a weasel marked white and dark brown on head, terrorizes the gophers and ground squirrels by a close pursuit. Cottontails resembling the swamp variety, swarm through all growth. Jackrabbits have become a pest. 'Coons inhabit the creek bottoms. Foxes between the red and gray types exist in great numbers. Wildcats approach town to rob roosts. These are here beside the small animals already mentioned in this letter. Then also deer at times are shot in the valley; venturesome mountain lions come down the hills. But black bears and the grizzlies avoid civilization. The rangers had hoped to close their guard for the summer by bringing in a grizzly that for some time has been making "sign" on the high peak east of our valley. The trail is also reported as having been discovered in a cañon within easy walking distance of Nordhoff.

Since the last letter was written, good luck secured for me several California tree squirrels, a gray variety, which, viewed closely, appeared even handsomer than at a distance. Their length proved to be twenty-four inches, twelve of it tail. Color seemed to be more sharply defined than upon the Eastern variety. The steel gray was sharp and free of tawny to its limits; under part snowy white; profuse tail, distinctly marked. They were shot while feeding upon the seeds of cotton wood timber. These beautiful creatures must not be confounded with the California ground variety, for this filthy pest, a cannibal in habit, lacks both in form and veracity of color; nor the ground variety with the chipmunk, which reappears here but slightly changed from the Eastern type.

The Warner Ranch Indians, the last of the Mission contingent likely to be disturbed, and whose removal has excited widespread pity, will fare well after all it would seem, as a fine property better than the original tract has been selected for them, and at a price that will make it possible to devote a large part of the appropriation to making improvements. Well-watered land in the southern part of San Diego county has been purchased. President Roosevelt took a deep personal interest in having these Indians provided for, their case being harsh in the extreme, and appointed a commission composed of men who could accomplish this end. The Sequoya League organized recently for the betterment of Indians, with the editor of FOREST AND STREAM upon its Executive Committee, has looked closely after the rights of its wards in this affair. But no provision can make removal of the Mission Indians from their homes less than a tragedy to be greatly deplored. H. R. STEIGER.

Natural History.

The Zoological Park.

A VISIT to the New York Zoological Park is always pleasant and one sees there always something that is new—either some addition to the collection, or an animal overlooked at the previous visit, or perhaps some habit in a captive wild thing not before noticed.

This is especially a good time to go to the park, when the October sun shines warm through a soft hazy air, when the grass is as green as that of June, and yet the ripened foliage of the trees is colored with a thousand soft and subdued colors, brightened here and there by the blaze of sumach on a hill or of some pepperidge or soft maple tree that has not yet lost its foliage.

If one goes to Fordham by the Harlem Railroad, and walks or drives the short distance to the park, he enters at its northwest corner, and, passing down between deer ranges on either side, goes through the bird house and so on to the geographical center of the park. The cooler weather has made it necessary now to bring into the bird house the tropical, or sub-tropical, birds, which have spent the summer in the flying cage, and the cage is thus no longer crowded with pelicans, ibises, cormorants, herons, spoonbills and flamingoes, but is tenanted by a few ducks, crows and magpies, with two great vultures and a fish-hawk. At a distance it seems very empty by comparison with its populous appearance in the summer. The birds, which have been removed from their condition of practical freedom to the closer quarters of the bird house, all seem healthy and in good feather. Just beyond (south) of the bird house, is a large yard which contains a number of foreign cranes, several of which bear a close resemblance to our familiar sandhill crane, though some are much larger and some of course are strikingly different.

Continuing southward, one passes other deer ranges, where whitetails and caribou are confined, on to the elk range, and here, confined in the elk house, and awaiting the completion of the lion house, are a number of the great cats which the Society recently purchased in Europe. As already stated in FOREST AND STREAM, there are six lions, two tigers, and a number of other lesser felines. These will be shown to the public in the course of a few weeks, as soon as it is practicable to install them in their new and permanent home.

In the elk house there are three large lions, two lionesses and a pair of tigers. The two Barbary lions, whose manes are very dark and abundant, are most impressive. A Nubian lion, which has far less mane, is on that account less striking. All three male lions seem cross, and one of them struck viciously through the bars of his cage at a person who passed near him. Unquestionably the close confinement of the little traveling cages which barely give the animals room to turn around has temporarily soured their disposition. No doubt a transfer to more roomy quarters will improve their temper. These lions are each about four years old. The two lionesses are very handsome animals, and seem much more placid than the lions. The two tigers, each two years old, are very beautiful creatures, and very mild and gentle, so far as one could gather by looking at them.

In the small mammal house is a Senegal lioness, a cub eight months old, very gentle, and a great pet.

Passing out of the elk house to the near-by wolf dens, it was gratifying to see wolves, coyotes and foxes, all in admirable condition. They are all cheerful and playful, and are now assuming their winter coats. In one of the cages here are two Eskimo dogs, deposited by the Peary Arctic Expedition, of which the male is the animal which led the team that drew Peary to his furthest north. This is a dog of great power, about the size and build of a gray wolf, but much more heavily furred and more muscular in the legs. The head, though wolflike, is far shorter than that of the wolf, and the color darker—almost a black on the back. The ears, too, are shorter and sharper. The female is slightly paler and seemed little more than half as heavy as the dog.

A new animal in the wolf den is a blue fox from Alaska, which is neither blue nor white, but a very pale gray. The Society expects to receive a dozen more blue foxes which are likely to come through Mr. Elwood Hofer.

On Mountain Sheep Hill are a number of new animals. At the north end, occupying the pen which held the little musk-ox given the Society by Mr. Whitney, is its successor, the calf brought on by Peary. It is very small, this spring's calf, and its horns are just appearing. Very heavily coated, the warm weather appeared to be causing it suffering, for it was panting. The musk-ox, like the wild sheep and goats, seen a little later, all seemed eager for dry food, and were picking up and eating the withered leaves, which were constantly falling into their pen.

Next south of the musk-ox is the pen occupied by a burrhel, a small sheep from India, characterized by horns very thick at the base and almost at once spreading outward and upward. It is curiously marked with black on the front of the foreleg, and has a black line on the flank. It is quite a small animal, not far from thirty inches in height. In the same paddock are two Vignau's sheep, much taller, slighter animals, with horns which somewhat suggest those of the moufflon.

The Siberian ibex is one of four in captivity. It suggests a very large goat with tremendous saberlike, backward curving horns, with strong transverse ridges in front. Its color is purplish brown and on the back it has a large patch of pale gray. Still further south is the pen which holds the beginnings of a herd of Spanish ibex, male, female and young, and one chamois. The horns of the male—though much smaller than those of the Siberian ibex, as the whole animal is smaller—are somewhat similar in character. Among these goats are seen also specimens of the tahr from the Himalayas, a curious wild goat found only in the high mountains. Of the Barbary wild sheep known also as aoudad, or maned sheep, the Society has now a little herd of five or six individuals. The patriarch, who has been here for a long time, is very impressive with his long throat beard and pantalets. There are females and young as well. The old male seemed to be disposed to fight some one when last seen, for he had been butting the ground until his horns and face were covered with earth. The herd of moufflon has increased in numbers, and the ram, which leads the flock, is as friendly as ever. If one passes near the pen and stops, he trots up to the fence, evidently desiring to have his head scratched.

The buffalo herd was confined to its corrals. There are three calves, two of which are now quite as dark as their mothers. Near the buffalo range are two smaller pens, in one of which is a wild boar from the Corbin Park; in another a wild boar from Africa.

No one is likely ever to go to the Zoological Park without visiting the bears, and on bears the New York Zoological Society believes that it leads the world. It has between thirty and forty specimens, representing ten species, and most of them are in splendid order. All the young animals have made good growth this year, and almost all of them are in the very best condition. Perhaps most interesting of all are those which came from Cook's Inlet, Alaska, called Kadiak bears. These two are markedly different from the grizzlies and black bears with which they are associated. They are of very great size, have short and very broad heads, well furred ears, and very thick and long hair about the neck and head. The two on exhibition differ considerably in size, and slightly in color. The largest is much the darker and is an exceedingly playful and attractive beast. The other day he was seen wrestling and sparring with a good-sized cinamon (black) bear, which of course did not approach him in size and weight. The Kadiak bear at no time put forth his strength, but the two played with each other on equal terms, like great puppies wrestling with each other, biting in play at heads and necks, and finally the great Kadiak bear allowed himself to be pushed over on to his back, while the black bear stood over him and pretended to maul him. Both bears were as active as cats, very quick, and, of course, strong. Their play was throughout entirely good natured. The Kadiak bear, when standing on his hind feet, was estimated to be between seven and eight feet in height.

The two great polar bears are growing, but not very rapidly. They are in good condition, except that one of them shows decided traces of a skin disease, which at various times has troubled both. During the heats of summer they spend their days and nights in the water, and much of the time backed up against the rock work which forms the sides of the bathing pool. Constantly rubbing against this they wear off the hair of back and hips, and finally scratch the skin raw. However, the new hair is now growing on the affected surface and undoubtedly by winter the coat will be perfect throughout. These bears are savage and cannot be handled. It is necessary, therefore, to transfer them to their shifting cage, where, the quarters being so much smaller, it is possible to reach and treat the affected part.

In the small mammal house in the park are a number of new arrivals. Here is the cheetah, a spotted cat smaller and paler than the leopard, which seemed rather cross and snarled when it was inspected. This is the hunting leopard of the East, native to parts of India, Persia and parts of Africa, and trained, as is well known, to capture game, and then to submit to be taken from its prey, blindfolded and put in its cart again. Here, too, are an African leopard, two black leopards, which decline to be seen, a young jaguar, noticeable for its dog-like head, and the very interesting hyena dog, or cape hunting dog (*Lycaon*) from the Kilmanjaro district of East Africa. This is rather a small animal, less in size than a coyote, with a hyena-like head, a bushy tail, the body striped and

barred with yellowish and blackish, and pied on the legs and belly with white. This species hunts in packs of from thirty to a hundred, and its numbers make it invincible.

In this house, too, is the gentle little Senegal lioness, already referred to. Here, too, is a beautiful ocelot, with two very pretty playful little kittens, born Aug. 14 last, and now as large as half-grown cats. Here, too, is a litter of half-grown opossums, which seem in good condition.

In the outdoor cages opposite the small mammal house there are interesting things. Noticeable among these are three fine mountain lions, which early in the day seemed as cross and ill-tempered as could be, growling and snarling at each other all the time, but after feeding they were extremely good-tempered, and played with each other very prettily.

It is a pity, but not surprising, that the walrus calf brought back by the Peary Expedition is dead. So little is known about the conditions which surround these animals in their native haunts, that it is almost impossible to keep them alive, and, as already stated in FOREST AND STREAM, this is believed to be only the third that has ever been on exhibition.

There is so much that is interesting in the park that a day is all too short a time to spend there. The reptile house and the monkey house, two of the most attractive exhibits, were neglected on this visit, though within their walls there is a very great deal that is well worth seeing. Other visits must be made to see all that is to be found there.

Ways of the Blue Grouse.

KELLER, Wash., Oct. 5.—*Editor Forest and Stream:* This has been one of the best grouse seasons we have had here since the opening of the reservation for mining, four years ago. We thought, as the spring seemed to be so late and it kept cold so long, we should have a short crop, for but few people here pay any attention to the game laws, but think they have a right to kill for their own use. And then they begin killing before the young ones shed their baby tail feathers.

It was March 10 when I heard the first old grouse hoot, and not long after there was a continual hooting on the mountain opposite my cabin. To add to the music, a pheasant kept up his drumming near the cabin. One Sunday I went over on to the small hill and sat, and with my binoculars watched him for nearly half a day. My glass has a power of twelve times, and as I was less than 100 yards from the bird, he showed up very plainly. Should he be there next summer, I shall endeavor to get a picture of him while he is drumming. I tried to get the photographer to come up and try this spring, but failed.

The grouse—that is, the blue grouse—come down from the high mountains every spring, and rear their young along the breaks of the Columbia and the small streams, and stay here till after the service berries are gone; then they work back up to the high mountains in time to help harvest the huckleberry crop, and the huckleberry puts the finishing touch to them. It must be like the celery putting such a rich flavor to the canvasback. When the huckleberries are gone, then they go to the tops of the highest peaks, where they take up their residences in some big fir, or one that has an abnormal growth, and there they stay all winter.

While in the Clearwater country I have noticed where they kept all winter; for whenever I passed the trees, I would examine the snow and I always found fresh droppings. Once while returning from a chase after elk, Taylor and I came under a tree, and from the amount of droppings we thought there must be several in the tree, but the foliage was so thick we could not see any. I told Taylor I would climb the tree and see if I could not roust some out. I had no difficulty after I had got ten feet from the ground; there were plenty of limbs. I got up within less than ten feet of the thick limb when grouse began to fly out, and there was six left the tree. Two of them lit in a near-by pine, and I got down and killed them. We took them home, and when they were dressed, there was nothing to be found in their crops but the tender pieces of fir browse. One was a young bird, and we fried it, but the other was an old one, and it took four hours' hard boiling to get it tender enough to eat. I shot their heads off, so they did not taste of the fir; but when they are shot through the entrails, then they taste, and no matter how much you may wash them, the taste is still there. I have often noticed a blue grouse with a flock of sharp-tailed ones, but I have never seen a pheasant among any of the rest of the grouse family.

About six weeks ago two of the miners from our mine came down one Sunday and wanted me to go out with them. John had a shotgun, and Jim intended to get my .22 Marlin. I told them I would go for a while, but I did not care to go too far. We started up a small cañon from my cabin, and climbed a mountain for about two miles. We saw several bear tracks in the service thickets and plenty of grouse sign, but not having a dog, we rolled rocks where we could find any small enough to roll. We started three birds out of one thicket, and I got a shot and killed one. Jim missed with the shotgun on the wing. We went around on to the top of the ridge, and here we found quite a bevy. There must have been about a dozen. I got one at the first shot, and Jim got two. John would not shoot; he said he would carry the game. An old grouse flew down the mountain several hundred yards, and lit in the top of an old dead pine. I went around down and when I got opposite, and on the same bench, I got where I could have a good shot. I was about eighty yards from the tree, and the boys were sitting up above me and watching, and discussing as to whether I would hit or miss. They knew that I would either hit its head or miss clean.

The grouse was sitting on the limb, and its head was at right angles to where I stood, which made the shot more difficult. But I felt equal to the occasion. I raised the little rifle, and held for the grouse's eye, and at the crack of the .22, down came the grouse. I heard John say that it was the best shot he ever saw made at a grouse. The boys came down and complimented me on the shot. I had struck the grouse in the eye. I then gave Jim the rifle and John took the shotgun, and we got seven altogether, but mine were shot in the head, while the shotgun drove the contents of their intestines through the meat, and to me those birds did not seem fit to eat.

That is the only hunt I have indulged in this fall. I have got so that unless there is some one to come along who wants me to go, I care nothing about it. I have been fishing but twice this summer here, but when over at Missoula, the Fourth of July, I went out several times. Twice I went up to the falls at Bonner, and there I saw a bull trout that weighed 20 pounds and 1 ounce. It was the largest char I ever saw.

Around here deer are a thing of the past. I saw but one this summer, and it ran across the road ahead of me while I gas going to town. Yesterday I saw a track in the road near the cabin.

I saw more bear sign this summer than for several years, but I did not see any of them. I have been wanting to get one treed so that I can kill it with my .22. A few beaver are still to be found along the San Poil, but they will not last long.

Salmon are now running, and the Indians have a trap in the river near the mouth. Some nights they get the trap nearly full; some nights they get not more than twenty. One night, two years ago, they got 2,600. Salmon run but little in the light moon. Now that the nights are dark, the Indians think they will get all they want.

L. P. WILMOT.

Vermin on the African Farm.

SOUTH AFRICA has often been described as a land of plagues, but an outsider can hardly grasp how much the farmer suffers from vermin, both carnivorous and herbivorous. In olden days the voortrekkers lost much stock from the ravages of the large and fierce carnivora, and to this day in parts of Rhodesia the owner of live stock can only insure its safety by erecting strong and high kraals to repel the attacks of predatory lions and hyenas. These brutes have, in civilized districts, been improved off the earth, but small stock all over the country still has to contend with a host of formidable prowlers. Chief among them is the Cape tiger or leopard, whose habitat is the wooded and mountainous kloofs as far south as Table Mountain. This brute is truly the stock farmer's bête noir, as when he gets among a flock of sheep his victims are counted by the score, the mere lust of killing causing him to destroy far more than are required to satisfy his hunger. His tit-bit is a young foal, but no stock is safe from his ravages, and, unlike the less bold vermin, he prowls by day as well as by night. Even to man his lurking habits, activity, and poisonous claws make him, especially when cornered or wounded, a dangerous opponent, requiring the services of a good gun and dogs.

Of the same species, but smaller, are the numerous wild cats, most destructive to lambs, kids, and fowls. The progeny of domestic cats run wild are to be most dreaded among them, such having even more than the usual amount of cunning. These vermin are usually hunted out of the kloofs by means of dogs, many farmers keeping terriers especially for the purpose. Of the three species of jackal two create great havoc among stock, the rooi, or red jackal, being the worst offender. Poison has not much effect upon them, as in nine cases out of ten their natural cunning causes them to reject the offered bait, which a valued dog often picks up. Packs of terriers and mixed dogs are of great benefit, but in such a vast and mountainous country the indifference of a few landowners will nullify the efforts of their more active neighbors.

Many farmers, rather than exterminate vermin, resort to the pernicious practice of kraaling or folding their sheep, and consequently their farms become the refuge and breeding places of jackals, which, unfortunately, sally out by night and molest sheep running on neighboring farms. The jackal, as well as the carrion crow, is very fond of ostrich eggs, and both resort to many ingenious devices to crack the thick shells.

The muishond, or stoat, confines his operations chiefly to poultry, with an occasional weakly lamb, but is most enterprising in clearing out any poultry yard which may be open to his attacks. The great aasvogels, or vultures, are usually beneficial scavengers, but sometimes vary their menu by tearing open helpless ewes in labor. The lammervangers, or eagles, carry off lambs to their eyries on the mountains. Baboons are common all over South Africa, and devastate the gardens, and, in addition, carry off young stock. Hunts are organized against them, and they are shot in large numbers. Poisonous snakes do damage, especially to sheep which tread upon them when grazing.

So much for the carnivorous pests. When we come to their herbivorous comrades, we find their number truly legion. The locust plague, formerly occurring only periodically, seems to have now come to stay. It is evident that there has been a wholesale destruction of creatures which used to keep down the numbers of this plague. It is a toss up whether the creeping voetganger or the flying rooibaatje is most to be dreaded. The latter can, with a favorable wind, be moved on by means of smoke, but woe betide the man in whose garden or land they settle for the night or on a cold or wet day. The voetgangers move on in myriads regardless of water or other obstacles, and death alone, by fire or under the feet of a flock of sheep, will stop their inroads. Hares, and especially the species, half bat half hare, called the spring hare, cause great damage to the crops. The latter gives a certain amount of recreation, being shot at night with the aid of a bullseye lantern, this being about the only means of putting an end to his existence.

Trouble in many places in South Africa is given by the ant. These tiny insects, in addition to devouring our houses and furniture, eat through trees and vegetables. Boiling water or lime and water is the only means of destroying them, but the difficulty is to observe the danger before it is too late. The white ant is considered the most destructive, but the red is also a terror to gardeners. Revenge is taken upon them by using their mound-like nests for floors of huts, tennis courts, etc., for which the material is well suited. In parts of the country caterpillars travel about in hordes, devouring all before them. The omnivorous interior native collects them in bags and turns them into a sort of shrimp paste. Another nuisance to the farmer is the fretful porcupine, especially in hilly country. A pair can do an incredible amount of damage in the potato or wheat land, but a stone wall effectually stops their entry. Hunting them has to be done in their roaming time, viz., at night, with dogs and sticks. When the ravager is discovered both dogs and men make a rush, and he is quickly dispatched by blows on the nose. The dogs soon learn to be very wary in attacking, imprudent ones receiving great punishment from the terrible quills. The flesh is very white and tender, and when baked forms a tasty dish.

Pests among the fruit trees are very numerous, most of them being imported. Thus the dorthesia, or Australian bug, wrought great havoc among the orange groves in the seventies, and only of late years has a destroyer been found for it in the shape of the vedalia, or ladybird. The phylloxera was introduced in 1885, and caused the uprooting of many beautiful vineyards. It has been met by the planting of phylloxera-proof American vines, on which the European stocks are grafted. Nowadays pear slugs, peach yellows, quince borers and insects and fungi of all sorts make the fruit grower keep a far more vigilant eye on his trees than he ever previously had need to.

Of parasites among live stock there is, unfortunately, an abundant supply, often caused by overstocking. In wet and marshy districts sheep fluke is very prevalent, although unknown wherever the soil contains a fair amount of lime and saline matter. Bots are very troublesome to horses on certain farms, and it often happens that one place may be notoriously unhealthy for horses, while its neighbor may be quite the reverse. "Tulp," or tulip, renders certain places deadly to cattle, while the tsetse fly has still to be reckoned with in the Transvaal and Rhodesia. It will be seen that South Africa has its fair share of plagues, and every year seems to add to them. Farmers often lament the good old days, when many now prevalent diseases were nonexistent and when, barring inevitable droughts, the stock owner and husbandman had little to contend with. —London Field.

Some Mississippi Creatures.

Editor Forest and Stream:

At the risk of the imputation of claiming an undue share of the attention of your readers, and your own forbearance, I will send a little "hodge podge" of various matters.

The rattlesnakes have not yet gone into hybernation, as the weather has not yet been cold enough. The lowest thermometer reading so far was 41½ degrees on the morning of Oct. 15, accompanied by a very light frost.

We have now a new pet, in the shape of a young red squirrel, who, in the language of Artemus Ward, is an "amoosin' little cuss," and a subject of considerable interest in a small way. He has the freedom of the office building, the windows and doors being wire screened, and gambols about at large, his favorite exercise being to run up and down the screen doors. He also makes a playground of me, and as I sit at my desk runs over me, and on the top of my head, nibbles at my fingers as I write, and makes squirrel tracks in the fresh ink on my paper. Certain hereditary instincts cropping out in this youngster are interesting to note; as for example, he will attempt to hide a nut by sticking it between two books on the table, poking it in tight with his nose, and going through the motions of scratching dirt over it with his paws.

While the rats, guinea pigs, and chickens, remained in the rattlesnakes' "den" without any show of fear on their part, nor any sort of strained relations arising between the snakes and their intended victims, one sight of the reptiles was enough to throw the young squirrel almost into spasms, and he was not content until snugly ensconced in the pocket of a coat hanging on a peg in a remote part of the building.

This little fellow is quite affectionate and will play with the fingers or with a string very much after the manner of a kitten, sitting on his haunches the while.

There was some inquiry made recently by a writer in FOREST AND STREAM as to whether squirrels drink water, and how. It is a matter of common knowledge in this part of the country, where pet squirrels are of rather common possession, that they drink water frequently, in the same manner that a cat drinks.

Speaking of pet squirrels reminds me, that in the fall of 1864, when campaigning in northern Georgia in a wooded region, the capture of squirrels became a fad with the Confederate soldiers. On going into bivouac at the end of a day's march, if any daylight was left, axes were seized and the surrounding forests invaded. Every tree showing a hole in it was cut down, and many young squirrels were captured. This was in September and October. It was not uncommon to see a regiment on the march with perhaps fifty squirrels perched on the shoulders of the men, strings being tied around the squirrels' necks for security.

The "quail" season opened here on the 15th. My friend B. and myself indulged in an afternoon shoot, and bagged thirteen birds (an unlucky number—for the birds).

Apropos of the recent discussion of "true sport," my friend B., who has an argumentative disposition, was disposed to take the æsthetic and non-utility side of the controversy—perhaps merely for the sake of argument. I determined to apply a practical test to the sincerity of his arguments on this occasion; so on our way home we stopped on a bridge and laid out our bag on the bridge railing—thirteen handsome birds, all in a row, strongly suggesting juicy broiled quail for breakfast, to rejoice the eyes of the "missus and the childer" next morning. As we were admiring the game, I remarked to B., "Now, it would be a gluttonous performance if we should take these birds home and devour them like hogs; in fact, very degrading to the high ideals of æsthetic sportsmanship. Let us pull off their heads and take them home as trophies, and to prove our skill as sportsmen, and we will throw the birds into the bayou for the fish and turtles to eat." Strange to say, my friend B. repudiated this suggestion with vehemence, and declared that he would not take a quarter apiece for the birds he had killed.

The bluewing teal have been in this country for a week or two past. Being in the vicinity of Horn Lake a few days ago, I heard heavy firing in that direction, as if a

South American revolution had invaded the land, and I presume it indicated a severe engagement with the bluewings.

The bear crop in the "Gazoo Delta" is said to be abundant this season, and it has been bruited about in the papers that President Roosevelt would come down as a guest of Governor Longino, to engage in a bear hunt under the guidance of R. E. Bobo, the king of bear hunters. It now seems probable, however, that the President will be detained in the North, after larger game.

COAHOMA.

Gigantic Grasshoppers.

APROPOS of Mr. Sprague's interesting contribution to the very rich (and unworked) field of translators' blunders, there is a curious one in a French version of one of J. F. Cooper's novels. The author wrote that a certain personage rode up to the house, dismounted from his carriage, and "hitched his horse to a locust." "Locust" here, of course, refers to a species of tree. The Frenchman's dictionary doubtless gave only "sauterelle" as an equivalent, a word applied both to the common grasshopper and the migrating locust. He translated: "Il attacha son cheval à une sauterelle" (he hitched his horse to a grasshopper), but was apparently dissatisfied. It probably struck him that the reader would be mystified, so he introduced a footnote at the bottom of the page, as follows:

"Dans les Estats-Unis les sauterelles atteignent parfois des dimensions énormes, incroyables. Quand on en trouve un spécimen de taille gigantesque, on l'empaille en y ajoutant des poids de plomb pour assurer la solidité. La bête est placée devant la porte extérieure, et l'on s'en sert pour attacher les chevaux."

"In the United States grasshoppers occasionally grow to enormous, incredible size. When a particularly gigantic specimen is met with, it is customary to stuff it, weighing it down with lead for greater solidity. The animal is placed in front of the outside door and used for hitching horses."—New York Times.

Owl on Ship 750 Miles from Land.

HONOLULU, Hawaii, Oct. 15, via San Francisco, Cal.—An interesting instance of a land bird being picked up at sea was reported by the steamer Tampico, which arrived from Seattle last week. When in longitude 137 west and latitude 60 north, the officers of the vessel were surprised to see a bird alight on the deck. It proved to be an owl, standing about a foot in height. The bird was then 750 miles from land and was exhausted. It soon revived, and has since been kept in a cage.

The Tampico was not the first boat the bird is said to have visited in midocean. The crew of the barkentine S. G. Wilder, which arrived in this port recently, from San Francisco, recognized the bird as the same one that had alighted aboard their vessel fully two weeks before the Tampico was visited.

At the time the bird stopped on the Wilder they were about five hundred miles southwest from San Francisco and fully fifteen degrees further south than the point where the bird boarded the Tampico.—New York Herald.

"Chained to Business."

The Desk Slave's Song.

O THIS is the song of the man who's chained
All day to the roll-top desk;
Who, sweltering over a type machine,
Assumeth a shape grotesque.
The breeze and the sunshine are not for him,
The sky is a mere hearsay;
He sits and he grinds 'mid the rustling sheets
Through all of the dull, dull day.
He thinks of the days when his hands were hard,
His arms like the best of steel;
He thinks of the days when his lithe limbs made
Good time on a racing wheel;
He thinks of the days when he held his own
In the harvesting of grain—
Then smiles at the thought that a croquet game
Can give him a next-day pain.
He sighs to remember the mighty brawn
He showed on the college track;
He thinks of the day when he played baseball,
And wishes those days were back;
He thinks of himself in a football suit
Well padded and picturesque,
Then weeps o'er recalling the flabby form
That's chained to the roll-top desk.
Oh, man in the field with the hoe or plow,
O man with the ditching spade!
Yearn not for the "easy white-handed job"
Instead of your sturdy trade;
There's money sometimes in the office grind—
There's life in the work you do!
You are fanned and warmed by the breeze and sun
And arched by a roof of blue.
Your food is the food of a hungry man,
Your sleep like the dead at night;
Your muscles are firm and your heart is good,
Your cause is the cause of right;
We slaves of the desk would renounce our hope
Of wealth or a "raise" in pay
If we could but feel as we used to feel
Back there in the "husky" days.

—S. W. Gillilan, in Los Angeles Herald.

A good story of a school inspector's recent visit to a small German village is related in a Berlin paper to the London Daily Mail. Requesting the mayor to accompany him, the inspector heard the latter mutter: "I should like to know why that ass has come so soon again." Arrived at the first school he began to examine the pupils in punctuation, but was told by the mayor, "We don't trouble about commas and such like." The inspector merely told one of the boys to write on the blackboard: "The mayor of Ritzelbuttel says the inspector is an ass." Now," he added, "put a comma after 'Ritzelbuttel' and another after 'inspector.'" The boy did so. The mayor is believed to have changed his opinion as to the value of commas.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Across New Brunswick on Snowshoes.—VII.

Christmas Camp.

ALL the way on our long trail from the Bathurst lakes south into the Miramichi country we had been continually in game country, except when close to the lumber camps. On the height of land from which we had recently descended, there was any quantity of moose and caribou sign. When we stopped for lunch on top of the big hill, we built our fire directly on the trail of a big bull moose which we had started as we had climbed the slope. On our way down the southeast side of this same hill we crossed several moose trails, one of a bunch of three, among which we saw one big bull trail. On the last side hill which we crossed before we came out into this little half-moon lake, we saw the workings of what seemed a good-sized herd of caribou. We surely were in the wilderness and surely that wilderness held game. When at last we had crossed the little lake, following our snowshoe trail back to its origin, we saw the trail of a big bull moose and the tiny tracks of a couple of sable, both directly in what might have been called Henry Braithwaite's front yard.

For it was Braithwaite's northernmost cabin which we had now discovered—a little lean-to camp extended on its sides and front with square upright slabs, which formed a wind break for the fire place and a chimney to carry out the smoke. Henry had not cleaned out the cabin of its snow, or, at least, it was half full when we got there. We shoveled it out, took off the chimney cover of pine boughs, and at once fell to work cutting wood, for, of course, in this sort of camp, it is necessary to keep a fire all night. It was now nearly dark and the snow was sifting down very steadily. We had no meat left and not very much tea or sugar, though we still had a small box of biscuits along with us. Under the circumstances we held a sudden and earnest council of war.

"I'll tell you what I'll do," said Charlie, "I'll just take a bite to eat and then light out as fast as I can on Henry's trail. He must have a camp somewhere not more than six or eight miles from here down the trail. We don't know where his trail is after it leaves the lake, and if we wait until to-morrow perhaps we could not follow the snowshoe track. I think I can follow it to-night if the snow stops and the moon comes up, and if I catch Henry then we'll learn about the country below here and we'll be all right. If I don't catch him, we may some of us get pretty hungry before long."

Investigations showed us that all the supplies in this shack consisted of a half bottle of molasses and about a pint or so of beans. Henry told us later he had not been at the camp for a little over three years, and only came up to see if he could get any trace of us—a most fortunate thing as it turned out. We all hated to see Charlie start out on so uncertain a trip at that time of day, after spending so many hours in he toboggan shafts, but as he seemed the one most apt to make a fast trip on the shoes, we turned him loose, and he went across the lake at a gait which warranted the wisdom of our selection. Then the rest of us went on preparing for our night in camp. We spent the night dozing as best we might, though much crowded in the little shack, which was only built for two persons. Our fire was built against back logs, which we leaned against the pine slabs of the wall. Once in a while the slabs would take fire, in which case we would pelt the fire with snow balls until it went out. On the whole, we made it out very comfortably that night.

Puzzling Moose Trail.

On the next morning, Dec. 24, we saw by contrast how fortunate we had been in the weather for our trip across the unknown part of the trail. Snow continued to fall, and it grew so soft and wet that presently it degenerated into a drizzling rain. Joe Ellis and Jack Moore went back toward the Serpentine to fix up some traps, and they carried with them the injunction to kill some meat if they possibly could, neither of them having as yet killed to the limit of his license. On our part, Adam and I took up the big bull trail which crossed in front of the cabin door, and if there ever was a bull moose more ardently pursued than that one, then surely he was in danger. We followed the trail for some three miles, its general course being toward the north and northeast, leading toward the West Branch. It was a most puzzling sort of trail, and at last it received additions until we were sure we were following not less than three moose, one of them a big bull. Then, presently, the trail seemed to turn and come back, the animals doubling on their back track. We thought we found horn sign of the big bull, and then again he would go through places where it seemed impossible for a full-antlered bull to pass. We figured that this bull was a traveler and was not yarding in that vicinity. Satisfied at last that he had taken the back track, we ourselves started back, and at last gave up the trail in the maze of tracks which went round and round about in the soft snow. The rain now began to come down pretty steadily, and the snow became so soft that it offered the worst snowshoeing one ever saw in all his life. The shoes packed full and the filling bagged and ice formed in cakes under the foot. We saw we could not travel, and at noon we made for the camp, both of us wetted through and through.

Discovery of Henry.

As we came down the hill toward the shack we saw smoke arising and knew that Charlie, plucky boy, had come back up the trail, which meant that he had some sort of news. It was, indeed, very good news. He had been able to follow the snowshoe trail, and not more than an hour after dark struck Henry, who was lying asleep in his next camp, that on Logan Lake, six miles below Moon Lake, where we now were. Henry gave him a square meal and told him that the best thing he could do was to come back and get the rest of us. Henry said that he had promised to be at his home camp for Christmas, and the home camp was twenty miles below. He had killed a caribou the day before and said he would leave a part of the meat on the trail for us below Logan Lake. He said if we started out early in the morning we ought to make his home camp on the Little Southwest Lake some time before midnight of Christmas eve. Then we could have Christmas dinner together the next day. Henry was accompanied by his son-in-law Albert, and these two had said goodby to Charlie that morning and had started down their trail south, while he came back to get us.

Christmas Eve.

So far, very well, and we were anxious enough to get down to Henry's place, for we were all hungry and wanted a square meal the worst way in the world. Charlie had not stopped to hunt. Adam and I had been unable to land our game, and even lucky Jack, who had come back with Joe early in the afternoon, also had to report a blank, although he and Joe had jumped four moose out of a herd, one of them a big bull. These details will show that it is not always easy to get moose on a snowshoe trip, no matter how abundant they may be. We had good hunters with us, but we had all done our best that day, and had not been able to get hide nor hair. We held another council. The rain was now falling steadily, and we knew perfectly well that we could not drag the heavily loaded sleds down to Henry's next camp, for part of the trail, Charlie said, was over pretty heavy grades. We resolved to spend Christmas eve where we were, in the hope that there might come a change in the weather, which would make sledding practicable. The snow was going very fast, and any snowshoer or tobogganer knows what it is to trek over this kind of footing on snowshoes. At this time Jack Moore and Joe Ellis wanted to leave us and go back over the divide trail to Bathurst camp, leaving Adam, Charlie and myself to complete the tramp southeast down the Miramichi country to the railroad, to come out thus in an entirely different part of the Province from that where we had first gone in. Ellis said that he had 268 traps, all dead falls, between the Serpentine and the northern end of his trapping line, and he was willing enough to have Jack go along with him and help him set up. (We later learned that when Jack got back to Bathurst Lake he caught a black cat and two mink in the traps which Adam and I had visited on the Nipisiguit River.)

We passed Christmas eve, all five of us, huddled up in the little shack, which was not large enough to allow us all to lie down at once. For fear of burning our blankets we did not cover up fully, but depended upon the fire. It was a dolesome sort of Christmas eve, and on Christmas morning there was not a man of us who had anything in his stockings but feet. Santa Claus passed us by. Our Christmas breakfast was composed of what the boys called "bean swagan," made up of biscuits, beans and water boiled together. It was good.

Tailoring in the Woods.

Now, we came to say good-by to plucky Jack Moore, for whom I had conceived a strong affection, for a quieter or more manly boy I never saw. Just to show Jack there was no coldness, I told him that I wanted to make him a Christmas present of a suit of clothes, to be delivered at Fredericton some time later.

"All right," said Jack—he always said "all right" to everything—so we started in to measure him, Charlie and I acting as official measurers. We found we had no tape line, and also discovered that Jack had no recorded measurements of his dimensions in any tailor shop at Fredericton. This situation might seem to offer difficultes, but not so to the inventive woodsman. In a moment or so Charlie fished out of his pack a long piece of twine string such as comes useful around camp. We then started in and measured Jack, tying a knot for every measurement. Knot No. 1 meant around the chest, No. 2 up and down along the back, No. 3 across the shoulders, No. 4 midships, No. 5 along his arm, etc. We went on in this way until we had a string full of knots, from which we thought the tailor could figure out a coat, waistcoat and trousers for Jack, all these measurements being recorded by myself on a piece of birch bark in due sequence. It happened that these knots ran down pretty near to the end of the string. Not long after that Adam, who chanced to need a string for something about his sled, cut off a section of our measuring string, and we never could tell whether he cut it off the front end or the hind end of the string. I presume this may, perhaps, make some difference with the proportions of Jack's suit of clothes, but the Fredericton tailor, to whom I delivered the specifications, said he would do the best he could, although I must admit that he looked grieved. I have not heard yet how the suit of clothes came out, although I have a sort of scientific interest in the matter, and hope to be advised at a later date.

We had our wish, the weather had turned out a bit colder by the morning of Christmas day. At half-past eight the sun was not yet up, and there was a soft, gray light illuminating the woods. The boys wanted a photograph of this camp of Henry's, which we had christened "Christmas Camp," and I was lucky enough to get a very good one. Then we shook hands reluctantly with Jack and Joe, and so parted, nor have I seen these two good fellows since.

Hard Sledding on Christmas Day.

Adam, Charlie and I now hit the trail industriously, bound south along Henry's trapping line. We passed through an open hardwood and spruce country, the timber being small and hardly worth cutting. It was a good game country and we struck quite a little moose herd half-way over to the next camp, not to mention caribou tracks, which we had now seen so often that we paid no attention to them. The crust on the snow was better than it had been the day before, but was just

strong enough to allow the sleds to break through sometimes and slue around in the little hollows of the swamps. The two big toboggans were too heavily loaded, for we had left one toboggan at Henry's camp and pulled our stuff down on two sleds. My pack was on Adam's toboggan, and I wished that I had not allowed him to take it, for I could soon see that his load was more than any fellow ought to try to pull. We were all pretty tired when we struck Henry's camp on Logan Lake, and, in fact, this was the hardest work that we had had at any time on the trip. We had covered six miles in getting to this first camp, and it was noon by the time we had our kettle boiled. Then I took my pack off of Adam's sled and did not allow him to have it any more.

We found the next six miles of the trail much easier, and toward the close of the afternoon we struck a mile and a half of nice going on the ice, which came to us as a godsend. This was Gover Lake, as Henry calls it. We were trying our best to make it out to Henry's home camp for Christmas, but we saw that it was an impossibility, and that twelve miles was to be the limit of our travel for that day. We found this camp near Gover Lake a very nice one. We now had plenty of meat, having picked up a quarter of caribou which Henry had said he would leave for us. We got a good rest that night and plenty to eat, which was, perhaps, about as useful a thing as any under the circumstances. A man can go for three or four days on light fare and hard work, but after that he begins to get weak very fast.

So we spent Christmas day of 1901, all of us working like slaves on the trail. Adam said this was the hardest day's work he ever put in on the hunting trail, and he told me that he had never been on any expedition which was quite as tough as this one which we were now undergoing. We all felt perfectly hopeful now, however, for we were on a plain trail, and knew that we were safe and sure to get out without delay. We could not help noticing the change in the country. Around us we caught a glimpse now and then of hillside and lake surface, and could see that the hills were lower, although covered with the same dense black forest growth in which we had been ever since we left the railroad and started up the Tobique waters. Game sign we continued to find just as we had all the way from Nictau Lake. I have never been in any game country in all my life where there was so much sign of game as we saw made by moose and caribou all over this country from Nictau Lake south as fa ras the Crooked Dead Water and Indian Lake.

Good Going.

We left Gover Lake at half-past eight in the morning and soon struck a big lake known as Birch Lake, where we got a lift of a mile and a quarter. Then we came into a level rolling region. We found splendid going this morning, for it had come off much colder in the night. The toboggan trail broken out by Henry and Albert would carry us up without snowshoes part of the way. I went on ahead with my pack and was able to travel much of the time without my snowshoes, so that I made Henry's Birch Lake camp, about four miles, in an hour and ten minutes. I rested here for some time and was about to start on, when the toboggans came in, Adam having stopped to follow up a moose trail at a little distance not far from the camp. We all of us concluded to "boil the kettle" here and have a bite to eat. We each drank a quart or so of good strong tea, and at 10:57 by the watch left for the south, continuing the trail over rolling lowlands, which had been crossed at an earlier time by a lumber road. I was by this time feeling pretty good, and was quite a different man from what I was when I first went in with Uncle Adam far to the north. I had lost about twelve pounds of flesh and was beginning to round to in good shape. I could surely say that snowshoeing was no longer any hardship. So I just thought I would spring a joke on Adam and Charlie, and would go away and leave them on that next four miles which lay between us and Henry's home camp. I hit the trail good and hard, hard enough to throw me into a most profuse perspiration. I supposed that I had a start of about a mile on the other boys, and thought I would go in and get dinner ready for them. At last, in just an hour and eighteen minutes, I sighted a group of low log buildings, in front of which was a man carrying a log of firewood. Him I hailed, and learned that he was Albert, Henry's son-in-law, and that this was indeed the home camp which we had anxiously sought and now reached, albeit a day later than schedule. Albert invited me to come into the house and throw off my pack.

"Where are the other boys?" said he.

"Oh, they're back about a mile on the trail, I reckon," said I.

Just then I looked out of the window and there, coming along under full steam, were Charlie and Adam, fresh as paint and only a couple of hundred yards back of me on the trail! How they did it I am sure I could not tell. My actual walking time for the estimated eight miles was two hours and twenty-eight minutes, and they had done it in pretty much the same time. We weighed the toboggans at the camp and found that one weighed 120 pounds and the other 125 pounds. My pack was a mere trifle, weighing only 25 pounds—a weight that is regarded by the New Brunswick man with absolute contempt.

At the camp we found Charlie Cameron cooking, and we set him to work mighty soon after we got under cover. Henry was out with his "sport"—in New Brunswick any sportsman is always called a "sport"—on a last attempt to get a head of game. His customer was Mr. Arthur S. Phillips, of Fall River, Mass., who had been with him for a month, going in the same day we left Fredericton. Mr. Phillips had seen a great many caribou and had crippled one, but had not yet killed a head of game. The boys said that the caribou were seen almost daily on the big expanse of the Little Southwest Lake, so after lunch Adam and I started out and took a trip of six or eight miles on a caribou hunt of our own in a strange country. We saw a great deal of caribou sign, but the recent thaw and freezing had left the ice so slippery that the caribou seemed for the time to have left the lake. Henry and Mr. Phillips came in that night and reported that they had killed one caribou, with a very indifferent head.

Home of the Big Bores.

Mr. Phillips took me to one side and besought me to advocate in FOREST AND STREAM the abolishment of all small bore rifles. He was shooting a small bore and bemoaning his fate in having lost a caribou which he had shot through the lungs. Here at the camp I saw Henry's famous battery of big bore guns, which Mr. Ireland described not long ago in these columns. Henry's favorite gun, the one given him by Mr. De Pauw, of Indiana, was indeed a corker. It weighed something over eight pounds and had a bore down which a cat might crawl with ease. We accused Henry of loading it with a can of frozen beans when he had nothing better by way of projectile. Now, here we were in the very heart of the big bore people, Adam and I exponents of the small bore, with all kinds of stories of what we had done and could do with the .30-40, and Henry meeting us with an incredulous smile.

"My moose are different down here," said he. Whereat Adam and I openly hoped that we would run across one of his moose and be able to destroy it utterly with a .30-40. As to which more anon, as they say in the story papers. We did feel a little like apologizing to Henry, however, for here I was carrying a small bore rifle, which is a horrible thing in Henry's view; wearing a pair of long-bowed snowshoes, which were anathema in the eyes of both Henry and Adam; and, moreover, with my feet encased in a pair of rubbers instead of moccasins! Henry thinks no snowshoe man ought to wear anything in the woods except a moccasin if he can help it. Adam says that for all kinds of weather the snowshoe pack is better, and I am willing to admit that we would have had wet feet for many a day had we stuck to moccasins. And so we had it around the big stove in Henry's camp; though, I must say, that a more cheerful and better natured set of wranglers never sat together on the same bench or ate out of the same pan of beans with a greater unanimity of action. We had Christmas dinner all over again.

More Caribou Sign.

Time was slipping away and still I had not had my shot. We decided to go out on the following day, which was December 27, for a caribou; so Henry and Adam and I went out for a social little hunt, I carrying the gun and sincerely hoping that we would run across one of the caribou which had been making all the tracks around the country. We saw what seemed to be sign of simply hundreds of caribou along the shores of the Little Southwest Lake and Jack's Lake, over to which we crossed in the morning. The caribou had been tearing up the snow in their pawing operations all over the country, and had we been there a couple of days earlier we certainly should have done business with them. As it was, the freezing up of the lakes had sent them back into the hills for the time—another instance of the bad luck which had followed me in my shooting operations for the past month. We walked eight or ten miles that morning and went back to camp for lunch, not having seen a caribou, though we had seen more tracks than you could shake a stick at. I accused Henry and Adam of each having a trained caribou, which was chartered for the express purpose of chasing around and making all sorts of tracks. All Adam and Henry could do was to grin and ask me to wait a while.

At the Crooked Dea Wat r.

On that morning Mr. Phillips had gone with Albert over to the next camp southward, where they expected to catch a tote team for Mr. Phillips to take out to the railroad. The latter gentleman had the misfortune to hurt an ankle, so that he found the five or six miles of snowshoeing very much of a hardship. Adam, Henry and I followed across the same trail that afternoon, and made it comfortably in time for an early supper. This camp we found not so spacious and comfortable as Henry's home camp, but more like the smaller trapping shacks on the north end of his trail. This camp Henry calls his Crooked Dead Water camp, and it is located in a famous moose country. At present there are two lumber camps close in together in that region, but this winter ends the lumbering operations, and Henry says that they have helped the country and not hurt it.

Mr. Phillips and Charlie Cameron having taken a team down the Miramichi country, there were left Albert and Henry, Adam and Charlie and myself in the little camp. It was big enough to hold us comfortably. We had lots of blankets, all the meat we could eat and plenty of every other kind of supplies. Henry told me that he stocked his camps about a year ahead, tobogganing the supplies out to the further camps from the end of lumbering team transportation. As near as I could discover, Henry's province was much like Adam's, and while Adam is king of the Tobique, Henry is king of the Miramichi. I don't know of any better kingdom, or, for that matter, of any better kings. They are much to be envied, and so is he who can have a trip with either of them. As to a man having a trip with both of these guides, admittedly the head of their craft, I don't know of anybody who ever did that except myself, thanks to the generosity of Adam and to the no less generosity of Henry, who permitted small-bore, long-shoed, rubber-shod people to come down into his country and chase his pet caribou and moose around.

At Indian Lake.

After our rest at the Crooked Dead Water, we pushed on six miles to Indian Lake, crossing several of the sinuous channels of the big back water made by the lumber dams. The weather was now brilliant, but cold, and the snowshoeing was not bad. Henry said that if we could get to this Indian Lake camp, we would be out of the sphere of influence of the lumbermen, so to speak, and right in the heart of a very good moose range. He said he had hopes to get me a shot at a moose before I left, although we had now only a short time left of the legal season. I knew perfectly well that I was not going to kill a moose, but also knew that I was going to keep on trying until the last minute. As to business and home, I had forgotten that there was such things. I wanted to be a king myself, and own a principality in New Brunswick. In short, I was seized of a swift rebellion, running back to the ancient Western days, and I wanted to run wild again, just for a year or so. As to the moose, Henry said he could show me one, or at least show me the tracks. Then he looked at my small-bore rifle and sighed.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

An Old-Time Game Law.

From the "Laws of Her Majesties Colony of New York," 1691 to 1709.

AN Act for the more effectual Preservation of Deer & other Game, and the Destruction of *Wolves, Wild Cats,* and other Vermine.

Be *it Enacted by the Governour, Council and General Assembly, and by the Authority of the same,* That from and after the Publication hereof, Whatsoever person or persons, Free-man or Slave, Christian or Indian, shall destroy or kill any Wolf or Wolves, or their Whelp or Whelps, any Wild Cat or Wild Cats, their Catling or Catlings, any Fox or Foxes, their Puppy or Puppies, any Squerrils, Crows and Black-birds, or their Young ones, in the Counties of *Suffolk, Queens County* and *Kings County,* shall have and receive as a Reward for each Wolf so destroyed and killed, the Sum of Five Pounds current Money of this Colony; and for every such Whelp under a year old, so destroyed and killed, the Sum of Fifty Shillings current Money afore-said. And for each Wild Cat and Fox, the Sum of Three Shillings; and for each their Catlings, Puppies or Cubs, Eighteen Pence; and for each Squerril Three Pence, and for each Crow, Three Pence; and for every their Young Ones, Two Pence; and for Black-birds after the rate of Four Pence half Penny the dozen, and their young ones, three Pence the Dozen. And that in the County of *Richmond,* for killing Wild Cats, Foxes, Crows and Black-birds and their young Ones, the like Price and Reward above-mentioned.

And for the more effectual payment of the said Rewards, *Be it Enacted* &c. That the same Rules, Courses and Methods, Forfeitures and Penalties be and be used in all and every respect, as are enacted, mentioned and exprest in an Act made in the first year of her Majesty's Reign, entit. *An Act for destroying of Wolves within this Colony.*

And for the Preservation of Deer, and other Game, within the Counties of *Suffolk, Queens County* and *Kings County* aforesaid, *Be it Enacted by the Authority aforesaid,* That whosoever within the Counties last above mentioned, Christian or Indian, Free-man or Slave, after the Publication hereof, shall kill or destroy any Buck, Doe or Fawn, or any sort of Deer Whatsoever, any Wild Turkeys, Heath-Hens, Partridges or Quails, their Eggs or young Ones, at any time of the year, except the times & seasons herein after mentioned and exprest, that is to say, for Deer, between the first Day of *August* and the first Day of *January;* and for Turkeys, Heath-hens, Partridges and Quails, between the first day of *August* & the first day of *April,* shall forfeit and pay for every such Buck, Doe, Fawn or other Deer so killed or destroyed, as aforesaid, the Sum of Thirty Shillings lawful Money of New-York, or in default thereof suffer Imprisonment for the term and space of Thirty Days, without Bail or Mainprize, unless within that time he or they pay the Forfeiture aforesaid; and for every Wild Turkey, Chicken, or Eggs, killed or destroyed, as aforesaid, the Sum of Five Shillings, like current Money aforesaid, or in default thereof suffer Imprisonment for the space of Five Days, as Above-said: And for every Heath-Hen, Partridge or Quail, their Eggs or young Ones so killed or destroyed, as above-said, the Sum of Two Shillings and six Pence, or two Days and one half Imprisonment, as aforesaid: One half of all which Forfeitures shall be to him who shall prosecute and sue for the same before any one of her Majestys Justices of the Peace where such Offence shall be committed, who is hereby Authorized, impowered and required to hear and determine the same, and the other half to the Poor of the respective County where any person or persons shall be of such Offence convicted.

And for the better Convicting of the Offenders in all or any the cases above-said, *Be it Enacted,* &c. That whatsoever person or persons with whom shall be found, or shall expose to sale any green Deer Skins, fresh Venison or Deers Flesh, Wild Turkeys, Heath-hens, Partridges or Quails, their Eggs or young Ones, at any other time of the year then what is before excepted, shall be held, deemed & judged guilty of the said Offence, and be thereof Convict, unless he or they shall prosecute and convict some other person to have done the same; and that the same green Deer Skins, Fresh Venison or Deers Flesh, Wild Turkeys, Heath-hens, Partridges or Quails, their Eggs and young Ones, so found as aforesaid, or any other probable Circumstances, at the Discretion of the Justice before whom such Offence shall be tryed, shall be held to be good Evidence of the Offences afore-said.

And be it further Enacted by the Authority aforesaid, That if any Justice of the Peace shall neglect or refuse to hear and determine any of the cases aforesaid, according to the Rules and Directions before-mentioned, every such Justice of the Peace so neglecting or refusing, as above-said, shall forfeit for every such Neglect or Refusal the Sum of Three Pounds lawful Money of New-York aforesaid, to be recovered in any Court of Record, or other of her Majesties Courts within the same County where such Justice of the Peace doth belong, the one half whereof to him who shall prosecute and sue for the same, and the other half to the Treasurer of the County where the said Offence shall be committed, and prosecution made, to and for the use of the same County. *Provided,* That nothing herein contained is intended, or shall be construed to Repeal or alter one certain Act of Assembly made for the Preservation of Deer, in the year of our Lord 1705,* saving the Forfeiture for Destroying of deer; but the same Act in every other part thereof is hereby confirmed. *Provided always,* That the whole Reward for destroying of Wolves and their Whelps is declared and intended to be only Five Pounds for a grown wolf, and Fifty Shillings for each Whelp in the whole, the said Act made in the first year of her Majestys Reign *for destroying of Wolves* notwithstanding.

* Below is a clause from the Act mentioned:

And be it also Enacted, &c., That Whatsoever Dog or Dogs shall be found hunting or chasing any Buck, Deer or Fawn, or any sort of Deer whatsoever, between the said first Day of January and the first Day of August yearly, shall and may be, and hereby are required to be shot and kill'd or otherwise destroyed, any Law to the contrary hereof notwithstanding.

An Early Day Way.

KELLER, Wash., Oct. 16.—*Editor Forest and Stream:* A few das ago, in company with a Virginian, I was going to Wilbur for some supplies for the mines, and after crossing the Columbia River, and getting up near Mr. Campbell's orchard, I noticed a flock of birds running along in a trail in the grass on the inside of the fence. At first I thought it was several larks, but they ran so smoothly along, that I looked more closely, and when they came out in plain view, I saw they were quail—regular old Bob Whites. And I cannot recall at any time the sight of any kind of game that gave me the same amount of pleasure that the sight of this little bunch of birds gave. There were twelve—eight Bob Whites and four little Biddies. They were the first live quail I had seen for forty-two years this summer. And they brought back to my memory many pleasant thoughts. I was so much pleased at seeing them, my friend asked how many years since it had been I had seen any, and when I told him forty-two, he looked incredulous. But when I explained to him that it had been as long as that since I had left the Missouri River at Atchison, Kan., he remarked that it was a long time.

After rummaging through my storehouse of memory, I unearthed a leaf that had indelibly stamped on it of the first live quail I ever saw. It was the winter I was seven years old. That winter father moved from the town of Platteville, Wis., to his mill on the Little Platte, and our nearest neighbors, Bowmans, had two boys about the size of my brother and I. Dick, my brother, was two years older than I, and was much stouter. Harm. Bowman was the size of Dick, and Ben was a little bigger than I, but they having been raised in the country, were much better versed in trapping and hunting than we town boys.

Shortly after we moved to the mill we went up and stayed all night with the Bowman boys, and we had a jolly time. The next morning early we went to the straw stack, where the boys had a couple of traps set for quail. Well, when we got in sight of them, they were down, and there was a race to see who could get there first. I tell you we were not long in surrounding one of the traps; Harm. loosened a wedge and moved a top board and put his hand in, and soon drew out a quail. He wrung its neck and threw it down, then he again put his hand in and drew forth another; this one he handed to Dick, who took it and instead of taking it by the neck and wringing its neck till it was broken, he took it by the feet, and after giving it several turns quickly threw it down, or tried to, when there was a whir-r-r, and away went a quail. Mr. Editor, if a picture of that group of boys could have been taken then, it would have been worth copyrighting, to see the sorrow on my face, the disappointment on Dick's and the disgust on the faces of the Bowman boys. As soon as Harm. could speak, he wanted to know what Dick had done, and when Dick told them that he took the bird by the feet and gave it several turns, then threw it down, there was an explosion of wrath and a statement that he would not get the chance to let another bird get away. So the rest of the executions were performed by the Bowman boys, which was a severe blow to our pride. I do not remember just how many birds we got, but there were quite a lot, and when we got to the house and Harm. told his father and mother, and they had a hearty laugh over it, to our discomfiture, and as soon as we could get away after breakfast, we started for home, and when we told father, he laughed more than we thought the case required.

We brought home some figure fours, and set some traps of our own, and it was not long before we had birds to wring, and we knew how to wring them. But these little fellows I saw here were safe, for the days of wringing birds' necks has long since been passed by.

LEW WILMOT.

Enforcing the Game Laws in Massachusetts.

BOSTON, Oct. 22.—*Editor Forest and Stream:* It would appear that some strenuous work in the enforcement of game laws in the old Bay State may be expected this autumn, if one may judge by what has already been accomplished. Without attempting to go into details, it may interest the readers of FOREST AND STREAM to mention a few instances which will indicate the forcefulness of the work that is being carried on and which is now apparently at full swing.

One of the neatest bits of detective work accomplished was performed just before the opening of the hunting season. Complaint of probable snaring at Middleton was received by the Fish and Game Commission, and Deputy Thomas L. Burney, of Lynn, was detailed to investigate the matter. He soon located the snares and reported the fact at headquarters. Immediately telegrams were sent to Deputies Nixon at Gloucester, Luman at Palmer and Shea at Ware to co-operate with Burney. This was Friday morning. That evening the four officers were at Middleton. Saturday morning they were out at 2 o'clock, and after a hasty lunch were off for the location of the snares at 2:30 A. M. It was a raw morning, with the chill of a coming storm in the air, and lying still in the brush hour after hour under such circumstances was anything but comfortable; it certainly needed the spur of official zeal and devotion to duty to make the conditions endurable.

Dividing into two parties, two men in each group, the deputies concealed themselves at some little distance apart along the line of snares, so they would be sure to intercept any one who might come to attend the devices, from whichever direction he might arrive. The hours dragged wearily; the chill fall winds soughed through the covers, and aching and stiffened muscles made it exceedingly trying to remain motionless. But their patience and endurance were finally rewarded.

About 9 o'clock Benjamin F. Gould, reputed to be an old offender, came into view, and began to examine the snares and to reset those which had been sprung. As he arose from setting a snare, he was astounded to see Burney and Luman, who had quietly approached while his attention was temporarily diverted. He was taken completely by surprise, as was evidenced by his ejaculations. When, however, he was told he was under arrest, he broke and ran, but was soon brought up all standing—or rather all in a tumble, for he was unceremoniously caught and thrown to the ground.

Two snared partridges were found on Gould, and considering he was not only snaring, but was prosecuting his nefarious work out of the hunting season, all interested in the protection of game hoped he would get the full penalty of the law. Much disappointment was felt, therefore, when the judge fined him only $20 instead of $60, which many felt he deserved, especially as this penalty was fixed by law. Nevertheless, the effect of this arrest and conviction was excellent in the locality, and it is doubtful if any other would-be pot-hunter in that section of the State will take the risk of engaging in snaring this fall.

As soon as Gould was safely landed in Middleton and placed in charge of the local police, the deputies "took to the woods" again, chiefly for the purpose of gathering the snares as material for evidence at the trial. Meanwhile the storm had begun, and rain fell steadily, driving into the faces of the game wardens and soon drenching them to the skin. But they were not swerved from their purpose, and after miles of tramping over the soggy rain-filled ground and through dripping underbrush, they returned to the hotel at Middleton. They were soaking wet, it is true, tired beyond question, and faint from hunger (for they ate nothing from their early morning lunch until 4:30 P. M.), but they had the pride and satisfaction of having done their full duty, regardless of adverse circumstances, and of having "the stuff for evidence" to take before the court next day.

Mention should not be omitted of the fact that Mr. J. Russell Reed, the widely known President of the Massachusetts Fish and Game Protective Association, volunteered to prosecute this case, thereby evidencing his public spirit and interest in the protection of game. But Gould plead guilty, and no active prosecution was necessary.

The Fish and Game Commissioners have been doing some very vigorous work recently. Twelve arrests for Sunday hunting were made on Oct. 19; another for having short lobsters in possession the next day, and I learn that another snarer has been caught red-handed this morning, with a partridge on him, and is now in the lock-up at New Bedford awaiting trial to-morrow. Except for the fact that the first two Sundays since the hunting season opened were stormy, it is probable many other Sunday hunters would have felt the pinch of the law. Even as it was, four transgressors were caught in one locality on Sunday, Oct. 12, and all were convicted and fined.

Many Italians have been captured and convicted for shooting insectivorous birds, and the reprehensible practice of shooting anything that flies, regardless of law, has received a decided check.

BAY STATE.

T End of Jerry.

An Incident of the Night in the Shasta Mountains, Told by Ransacker in the Sacramento Bee.

JIM W. differed from the Father of his Country in one especial attribute. Whereas, inasmuch as the latter could not tell a lie, it was equally impossible for Jim to tell anything else. He was thought to have been a native of Georgia, but it is only safe to say that he was a native of one of the Southern States. He made very improbable estimates as to the wealth of his parents and the number of negroes they owned, and would give descriptions of his early life and surroundings absurdly incompatible. Claiming to have never known what physical labor meant, he knew and practiced little else; pretending to have been reared in luxury and refinement, in reality he knew nothing of either; and alleging to have been possessed of every advantage in his young days, he could neither write his name nor spell the large words on a flour sack. Ignorance was his main fault, however, for in other respects he was trustworthy, and thoroughly reliable in everything except what he said.

It was simply an impossibility for Jim to make a declaration, a plain statement, answer a question, or respond to a query on the square. When questioned regarding any subject, even if the answer implied was simply "yes" or "no," he would either give the adverse response, affix a preamble or attach a sequel wherein he was sure to introduce a most astounding improbability or elaborate lie. Being fond of hunting, he spent a good portion of his time in the mountains with his rifle, and as slang expresses it, he could "talk a man's arm off" regarding his exploits. His anecdotes were oddly characteristic of himself, and he made his most ponderous statements in a modest, apologizing, good-natured way, which held his hearers in silent suspense, as he proceeded, and left them limp and stupefied when he ended. It would be impossible to successfully repeat any of his startling narratives, but I recall an instance in which Jim's exaggeration of facts led to a catastrophe that afflicted him very seriously. He lived alone in a log cabin in the hills (alone, excepting his dog and a very large cat that he called Jerry), and employed himself in mining a little in his almost exhausted placer diggings, and in hunting. Jerry was his most valued possession, excepting, perhaps, his gun. Jerry was the hero of many an astonishing anecdote, and Jim claimed that he was superior to any dog, either in scenting and actually "pointing" deer or in tracking a wounded one. It was really known that the big gray cat trotted along at his heels, following with the dog, when Jim went hunting. It transpired that Jim came, as was his custom occasionally, to spend a few days at B. Ranch, some three miles from his home. He brought his dog and left Jerry the cat as he supposed to stay at home. We had four dogs at the ranch, and when Jim's dog came he enticed them into hunting at night, at which times they yelled up and down the creek, frequently treeing coons, foxes, etc. When we knew them to be in easy distance we would take guns and go to kill whatever they might have treed. Jim talked a great deal of a panther he knew to be in the neighborhood, and one night he rushed in as we were about to retire, with the information that the dogs had the California lion. He had heard its cries and knew the dogs had him treed, finally claiming to have seen it himself. Though incredulous, Jackson and myself concluded to go; so, lighting a lantern, and loading the shotgun (somewhat), we set out, accompanied by Jim. The night was very dark, and the dogs were baying down the creek at a point we knew to be in dense brush. The dogs barked very excitedly, and as we approached we heard howls from them, indicating that whatever they had it was not to be trifled with. The tree was densely hung with wild grapevines, and the dogs were panting and snarling underneath. Occasionally, by the light of the lantern, a shadow would be seen to descend the tree, and immediately a dog would rush out of the vines with a unearthly howl; then the apparent shadow would reascend, and the dog would charge back again, wilder still with rage. We began to think it was the lion. Jim was sure it was, and he euthusiastically cheered the dogs on, and instructed me to fire the next time the shadow appeared—to fire both barrels and shoot sure. Accordingly, seeing the leaves move, and the object apparently about to descend, I fired. I fired both barrels. We had intended to put large loads in the gun, and I rather think we did. I am under that impression. I accomplished a double-back somersault as the boys do in the circus, and then I thought I fell to pieces. Under the excitement, I reassembled myself somehow, and rushed forward to see how matters stood at the front. Well, after the explosion there was heard a "dull thud"—so Jackson said (intimating that he meant nothing personal), and the dogs pounced upon the lion. Jackson held the lantern, and Jim hissed the dogs. The lion was evidently done for, and Jim was hilarious; so after letting the dogs "have him" for some time, and ascertaining that he was inanimate, he cautiously reached in, grasped the lion's tail, and carefully dragged it out of the vines, chuckling with delight. He lifted it by the tail, saying that it had a mighty long tail—held it in the light of the lantern, and then his visage paled, his countenance fell, the tail dropped from his unnerved hand, and he exclaimed: "It's Jerry, by criminy!" Sad to relate, it was the big gray cat Jerry, and riddled with buckshot, he was a hopeless case. Beyond any possibility of a doubt Jerry was a dead cat. Even the dogs seemed ashamed of themselves; and Jim's dog in particular slunk away and was invisible for two days. We marched home under an oppressive silence until Jim volunteered the expression that it was "too bad," and that he "might 'a' node it was Jerry; he was alwus ruff on dogs." Then he added, as his irrepressible mood revived, "But didn't he make the fur fly on them dogs, though! I've node him to lick more'n a thousand dogs! Once when I was gwine"—but it was a long yarn.

Maine Moose.

BOSTON, Oct. 25.—Moose are coming into the Boston markets. The way is open, and nothing is done to stop the shipments. A man with a moose in charge comes right along with no other questions asked than, "Who claims the moose?" the usual interrogation at Bangor. At other stations no questions whatever are asked. On the train, or at the American Express office, the shipper simply has to direct to what firm in the market the moose or deer shall be taken. The next day, or a day or two after, according to previous understanding, the man who brought the moose appears at the commission house and claims the pay for the animal. What could be easier? Is market-hunting to be carried on in such a fashion till all the big game in Maine is exhausted? Four moose I have already seen in the markets here. If one of them was not killed several days before the open sesaon—Oct. 15—then a bad state of decay is no indication. In this case the buyer of the moose threw up the bargain, when he found the state the venison was in, and will demand his money back from the commission house. In another case a man came through with a moose, claiming that he shot it himself. It cost a good deal to get him to the railway station. Then the express to Boston was not less than $2 per hundred pounds, the American Express Company controlling the shipment of moose and deer, so that they cannot be sent as freight. The man was a good deal disappointed when he found that his moose was sold for ten cents per pound. It weighed a trifle over 400 pounds, and did not pay well for bringing to Boston. One antler was a long forked horn, with a single prong. The other was fairly palmated.

Messrs. W. T. Farley, P. R. Spaulding, O. C. Ward and T. S. Tellett are just out of the woods from a moose hunt. They gave a moose dinner at the Westminster Thursday evening to a few invited guests.

BOSTON, Oct. 27.—The big game record at Bangor is great; for the week, 630 deer and 45 moose. This is the biggest week on record at that point, and other sections are showing up about as well. For the season the record is 1,192 deer and 45 moose; last year 1,076 deer and 46 moose; same time in 1890, 1,000 deer and 56 moose. Boston sportsmen are coming home with good records; at least we hear of the good records, but nothing of the failures. It is certain that the number of hunters who have been to Maine thus far is greater than ever. Word came from Enfield, Me., Saturday, from A. M. Darling, that A. L. Brett, of Boston, had left for home with a moose weighing 897 pounds, the first and largest from that section for the season. It took four days to get the monster out of the woods. R. W. Thain also had a large buck deer. John W. Connelly and P. W. Barber, of Newark, N. J., have taken out moose from the Rangeley region. They were shot somewhere above Eustis. Boston hunters who have brought home deer for the week from the Rangeley region are B. N. Kenney, Miss A. M. Davis, J. W. Long and Frank Vickery. W. M. Palmer, of Boston, and his sister Alta Palmer, and his brother George Palmer, who have been hunting in the Machias region, have had good success. The other morning Mr. Palmer started out from camp early and soon encountered a big bull moose. He fired upon him, but the moose charged upon the hunter, and it took another shot to stop him when he was altogether too near for safety. Commissioner L. T. Carleton reports that he found a case of illegal moose killing at the camp of Dr. D. A. McLeod. It was a lumber clerk who confessed, and is to pay a fine of $500 and costs. Mr. Carleton says that the law which permits of the killing and using of not more than two deer in a season at any one lumber camp is being grossly violated. Who ever knew of such a law being obeyed?

It has been the rule at most lumber camps for nearly every man to have a rifle, and most of them hunt Sundays; each, claiming, under the law, his right to two deer in a season. These deer are used at the camps at more or less of a profit to the captors.

The celebrated Indianapolis party about whom so much has been said in Maine game law discussions, has left Jackson, taking 21 deer. Five were used in camp as food, and one was spoiled by warm weather. This is a much smaller number than represented in the arguments for a license law last year, when speakers would have us believe that the party killed two or three hundred; a gross exaggeration.

Vermont hunters are getting some deer this season. Mr. E. C. Stevens and Geo. H. Childs, of Boston, are out for a hunt of several days in Salisbury, in the vicinity of Lake Dunmore. They brought out two handsome bucks, of which they are very proud.

Shore-bird shooting has been disappointing at Chatham. The best bag of the season is credited to Charles Woodman, getting 62 large birds in one day. Although the duck-shooting season has opened there, but few black ducks have been taken. Quail shooting along the Cape is good, and Boston gunners go down most every day. Small Point, off Saguin, and near the mouth of the Kennebec River, is a celebrated place for bird shooting. It is controlled by a club. A party of owners and invited guests returned from shooting there last week. In the party were ex-Mayor James Gould, of Chelsea; Freeman Low, Thurber Adams, Grant Adams, E. N. Cook, and Joseph Mitchell. They found only fair shooting, although the Point is exceedingly favorable; jutting out into the sea, so that flights are easily caught in range. Their biggest day was 24 coot. Black duck were also obtained in considerable numbers. Partridge and woodcock shooting was fair on shore. Mr. Freeman Low is 79 years old, a long-time member of the club, was every morning at the blinds in season, and had fair success in shooting, though his hand is scarcely as steady as years ago. SPECIAL.

CHICAGO AND THE WEST.

CHICAGO, Ill., Oct. 25.—Our backward spring and wet summer have turned off into a very beautiful fall, and during the past week the weather has been as lovely for outdoor purposes as the heart of man could desire. We have had moonlight nights and light warm rains, conditions perfect for the last flight of jacksnipe from the north. A few jacksnipe have been noticed around the Goose Island preserve along the Kankakee River in Illinois for the past ten days, and the country along the Fox River up toward Fox Lake has also reported a small flight; while from Wisconsin points such as Koshkonong, Horicon, Winneconne, etc., the snipe have been in for a couple of weeks in fairly good numbers, though only waiting for a cold storm before dropping down to the wintering grounds of the south.

Mr. C. C. Hess, of this city, goes to Goose Lake Club preserve to-day for a try at ducks and snipe. He says that quite a number of ducks have been reported for the last four days around the preserve grounds.

Mr. O. von Lengerke and his friend, Mr. Oscar Kausche, leave this afternoon for a little snipe hunt in upper Illinois on the Fox River.

Mr. Eddie Bingham reports that he killed a couple of hundred ducks on Lake Koshkonong on his trip to the old homestead about two weeks ago. Most of these birds were small, deep-water ducks, and the smaller marsh ducks, but the big deep-water ducks were coming in at the time he left, and have since then appeared in good numbers.

Canvasback ducks are reported this week in some numbers on Fox Lake, Wis., also on Poygan Lake, with redheads and bluebills in even greater quantities.

Dr. H. C. Buechner, of Horicon Club, Wis., starts from Chicago to-day for a try on the old-time Horicon marsh, which he thinks from all reports will be good for the next few days.

Reports from Lake Senachwine, Swan Lake, and the lower Illinois country, say that the flight which was in there the first of the present week has within the last three days disappeared, and the club pushers think that the birds have gone on south. The weather remains bright, fair and warm all over that part of the State.

At Tolleston Club the customary abundance of ducks prevails under the system of feeding and nursing which has so long obtained in those privileged waters.

The Northwest.

The northern flight has been in over North Dakota and Minnesota for some days, and the next ten days ought to see pretty nearly the cream of it. South Dakota is not so good as North Dakota or Minnesota this year. The latter State can offer better duck shooting now than it could fifteen years ago, and North Dakota still continues with an enormous supply of wildfowl which, by every reason in the world, ought before this to have been exhausted.

The Saginaw Crowd had good luck on their trip to Dakota this month, the date of their start having been mentioned earlier. They went in at Dawson and found it as usual overrun with hunters, although there was lots of water this year and a consequent abundance of ducks. They met fair warm weather, Indian summer, which, of course, was not ideal for ducking purposes, though very pleasant for the purposes of a general good time. Mr. W. B. Mershon and Mr. George Morley made a side trip for a couple of days and located a new lake, of which they think pretty well. The party may visit this new lake next year. A good many sharp-tailed grouse and prairie chickens seem to have appeared around Dawson this fall, and my informant states that he is sure there are some cross-bred birds between these two species of prairie grouse. The car party had no dogs along, but a party could usually take a team and pick up a dozen or two birds any day by just driving along and scaring them up.

These Dawson lakes furnish some good food for deep-water duck, such as the canvasback, and this perhaps accounts for the fact that there were more canvasbacks than marsh ducks in the Dawson country ten days ago. Not very many mallards were seen, though there were quantities of teal and spoonbills. The Saginaw party were unlucky in their goose hunting this year, and did not kill a single goose, which is the first time that they have failed to do so. This was their twentieth annual trip, and all of the gentlemen are willing to place it on the record of the successes hitherto unbroken. They state that there is very little grain being raised around Dawson now, and the country is going into stock raising. This will not help the goose shooting, but will keep the country wild and unbroken, which will work beneficially in regard to the grouse and ducks in all likelihood.

Dr. W. L. Baum, of this city, returned last week from a successful trip to Stump Lake, N. D. He reports that he and a party killed 187 canvasbacks beside other ducks. He is reported to have said that he and two other guns killed ninety-six canvasbacks in one day. He is reported also to have offered ducks for the table of some of his friends at the Union Restaurant, of this city. Of course he did not bring these ducks from North Dakota, for the law of that State prohibits taking birds out of the State.

Illinois Quail.

We do not talk of Indiana quail shooting now ,but of Illinois quail shooting, since the Indiana license law has placed that State in the category of things not mentioned in polite society. In the lower part of Illinois the quail crop is undeniably less than it has been at any time for the last three or four years. It will not be a big quail year, and shooters will have to work more than heretofore. Yet there will be quail enough for good sport, enough to quite open the eyes of any shooter from the East who is not accustomed to putting up a dozen or twenty bevies of quail in a day's tramp.

Western Men and Eastern Big Game.

I have already mentioned at different times the growing tendency of sportsmen of the Middle West to turn eastward for their big-game hunting, rather than toward the West. Mention was made of the success of Mr. M. T. De Pauw, of New Albany, Ind., on his moose hunt on the Miramichi in New Brunswick this fall. Mr. Robert Allen, of Fredericton, N. B., writes me that this head is undoubtedly one of the largest ever seen at Fredericton. Mr. Flewelling, of the Crown Lands Office, measured this head and reports the antlers' spread as 62½ inches. The extreme point of the right hand antler had been broken off, otherwise the head would have gone at least 64½ inches. The left antler measures 41 inches in the web, carries 21 points, and has a blade 18 inches wide. Mr. De Pauw was in for a month with Uncle Henry Braithwaite, and it hardly need be stated that he came out a big-bore convert. It required two shots of a .577 rifle to bring this big moose to his knees. The animal measured 7 feet 4 inches from foot to top of shoulder. The head will be mounted in New York. Mr. De Pauw also got a handsome caribou to his own gun, and he was the fortunate recipient of a very valuable present from Uncle Henry, a mammoth pair of interlocked caribou horns which the latter found on the Graham Plains last spring. One of these caribou antlers is the largest ever taken out of New Brunswick and would compare favorably with the best Alaska specimens. The antlers are rib-shaped, and have no less than forty-seven prongs and points, some of them over a foot in length. Uncle Henry says the carcasses had been partly eaten up by bears when he found them, but it was plain that the smaller horns had belonged to the larger animal, and this animal had evidently taken the aggressive, as its horns were fast locked in those of the other. Braithwaite was offered $100 for the pair of antlers, but preferred to give them away for nothing, which is very much like Uncle Henry.

Messrs. Mason Benner and B. H. Mast, of Dayton, O., are two other Western hunters to try New Brunswick. They were in at Clearwater with B. Norrad. Each secured a fine moose. Mr. Benner's head measuring 57 inches in spread. They go from Fredericton to Brownville, Me., to have a little deer hunting. I fancy they will not find it hardly so safe deer hunting as it was moose hunting in New Brunswick.

Among others who have been lucky in New Brunswick, are Mr. F. W. Tolles, of Naugatuck, Conn., who hunted on Rocky Brook with Daniel Munn as guide, and got a good moose. This head measured 60¾ inches, the antlers being better matched than those of the De Pauw head.

George and Coleman Carnegie, nephews of Andrew Carnegie, are still out on the Taxis River, with Billy Griffin for guide. A Philadelphia gentleman whose name is unknown went up the Nashwaak with Tom Pringle last week in search of moose.

Dr. D. W. Green, of Dayton, O., was also in with B. Norrad, and was lucky enough to kill his moose and caribou again, repeating his feat of last season. Dr. Green made a good impression in New Brunswick, and they are anxious to have him come back for his third trip.

On the whole, the New Brunswick season has been a record breaker. There has been a big influx of American sportsmen, according to Mr. Allen, of the Fredericton Tourist Association, and their success has been phenomenal. Over forty moose heads had come into Fredericton at the date of Oct. 17, and this represented only the heads from the Southwest Miramichi district. All the Tobique and northern heads go out over the Canadian Pacific without coming through Fredericton. This latter is Adam Moore's territory. The latter thoroughbred came out Sept. 30 by way of Bathurst with the Messrs. Foote, each of them having a fine moose. Adam returned at once with three Hartford graduates, one of them a Chicago man whose name I do not get at this writing.

So much, then, for FOREST AND STREAM's principle of protection, good laws and good enforcement. New Brunswick is surely old enough and much hunted enough. When you see Chicago men and Ohio men starting to New Brunswick for a big-game hunt, you may be sure there is a mighty good reason for that. The reason is that they are practically sure of getting what they go after. The reason that they may be thus certain exists in the fact that the game of New Brunswick is protected in fact, and not merely in name, as is the case in the United States. E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

In a Canyon.

ONE day while crossing the Rocky Mountains in the spring of 1872, in company with our guide and a Navajo Indian, after supper, which we had rather earlier than usual, I stepped to one side to view a large cañon or gulch which was on our right. While peering down in the gloom I saw two strange objects moving about in the bottom of the cañon. After my eyes became accustomed to the semi-darkness in the gulch, I made out the strange beings to be a man and woman perfectly nude. The bodies seemed to be covered with hair, and by their actions I made out that they were in quest of frogs and bugs for food, as by carefully watching I saw the female put some wriggling thing into her mouth, which I supposed to be either a lizard or frog. They did not know that they were being watched. I made a slight noise, which attracted their attention. They both suddenly looked up at me, gazed for a second in startled surprise, then disappeared like lightning.

Relating what I had seen to my companion, the guide, who is an old man and had followed the occupation of guide for several years, proceeded to tell us a tale about these creatures, the sum and substance of which is about this: Ten or twelve years before a party of emigrants had attempted to cross the mountains at this particular place. The weather being severely cold, it was supposed that the whole party perished, all but a man and woman, who survived, but so great was their sufferings that they became mentally deranged, and have wandered about the mountains ever since like the rest of the wild beasts by which they are surrounded. Some time back a party of gentlemen, with the assistance of Indians, tried to capture them, but all in vain, as they hid in some of the many caves which abound in this part of the mountains, and the search was useless.

I had a greater curiosity to visit the part of the gulch in which I had seen these wild people, and after traveling some distance down the mountains, I discovered a place by which I could descend to the bottom. The rest of the party decided to wait until I could explore the gulch to my satisfaction, but none of them seemed to care to accompany me. After traveling up the gulch for some distance and turning a sudden bend, I saw both these poor creatures not fifty yards distant. I had a good opportunity to observe their actions. The man was stretched full length upon a rock; his body, like that of the female, seemed to be grown over with hair; his face was hideous and repulsive in the extreme and baffles description. The woman was amusing herself by digging in the ground with a small stick as she sat cross-legged upon the ground. Her hair was exceedingly long and black, and her face looked as though it had never come in contact with soap and water. After looking at them until I was satisfied, the question suggested itself to me, should I quietly withdraw and not disturb them, or let myself be seen. I stepped from behind the rock which had concealed me, into full view. No sooner did they see me than the woman gave a piercing scream, which echoed down the gulch, and springing to her feet, with her long hair streaming in the wind, they disappeared in the mouth of a cave. J. W. DRANE.

New York State Law vs. Game.

ROCHESTER, N. Y., Oct. 24.—*Editor Forest and Stream:* I note what you and others have to say as to the disappearance of the woodcock, and I am greatly interested, not only in the woodcock, but the quail and the partridge. Why do you not stand to your Plank, viz., of closing the market to them, at least for a period of years?

Many with whom I have discussed this subject believe that the closing of the market, and that what birds are left will do the rest. Close it for the ducks and snipe, and we will have practically no spring shooting.

We who shoot for the recreation know that we do not deplete the supply to any appreciable extent. I believe I know pretty nearly the scores of all those in this city who shoot for the sport; and I also have quite definite information concerning those who shoot for the dollars and cents they get for their birds, and the scores of these persons will very much more than equal the entire lot taken by the former class.

Those of us who have votes should see to it at once that our respective Senators and Assemblymen know our wishes; and we should insist upon a pledge from each as to their support of legislation on the lines above indicated.

Governor Odell, I regret to say, recommended and had passed very injurious legislation; I would rather refer to his bill for bonding of game during the close season. Especially when you learn that but seven or eight concerns in the entire State gave bonds. Are the others not selling illegally as in former years? The Governor's veto of the Williams bill, to prohibit the sale of grouse, was and is indefensible.

For three years the State of Massachusetts has had a non-sale law as to woodcock, quail and grouse, and residents of that State declare it a great success; and that these game birds have increased to a surprising extent, and the Game Commissioners of that State also report the same very pleasing results, and why should not the great State of New York try it?

Fellow sportsmen, see that your candidates for Senate and Assembly are right on this very important subject to us. It wrongs no one. J. R. F.

Where Bears are Dangerous.

THE Altoona (Pa.) Times records: "Howard Tobias, a former clerk in the freight depot at Hollidaysburg, who is now engaged in the grocery business at Everett, Pa., met with a serious accident last week. While returning from delivering goods at Tatesville, the horse he was driving frightened at a bear and ran off. The wagon struck the side of a bridge and Mr. Tobias was thrown down a depth of about twenty feet, his face striking a huge rock, his jaw was fractured, three teeth knocked out, and he received a number of other minor injuries on the body. He is a brother of Mrs. George Brennaman, of this place."

The Adirondack Man Killings.

Editor Forest and Stream:

A letter from the Adirondacks states that snow fell there last Monday afternoon. This reminds me of Adirondack interests and of some in particular which I do not remember having seen mentioned in your columns. I refer to the relation between the present game laws and the killing of men by mistake. Just after one of the sad tragedies early this fall, I met an old resident on a mountain road. Commenting on the shooting he said: "We didn't use to kill so many men in the old days when hounding was allowed. I tell you Mr. —— they have got things down altogether too fine."

A few days later I mentioned this remark to one of the most intelligent guides in the Adirondacks, and he replied: "That's so. In the old times shooting a man was almost unheard of, while since the present anti-hounding law went into effect about one hundred and fifty people have been shot in the Adirondacks by mistake for deer." He had been keeping tally of the reported shootings in the five years with that result. He said not all the shootings were fatal, but thought the majority were, and added: "I submit that the lives of these people killed by mistake were of more value than all the deer in the Adirondacks."

Might it not be well for some of the overwise legislators to consider such facts as these? And should not both candidates and voters in the present campaign remember that eternal vigilance is the price of——our forests in the Adirondacks?"

Any State officer whose course is subservient to the lumber interests there is recreant to a public trust. At least that is the opinion of JUVENAL.

Long Island Shooting.

BAYPORT, L. I., Oct. 27.—The ducking season opened here under very favorable conditions, the weather being all that could be desired. More than the average parties were out battery shooting from the neighborhood, and good bags were made, one gun bagging sixty-five ducks, and several others from twenty-five to forty each the first day. They are mostly broadbills, though several redheads have been included in the bag. I was out Saturday with guide Le Roy Still, and the number of ducks in the bay would have to be seen to be credited, for so many never have been known here at one time. Enormous flocks from a quarter to half a mile in length were a common sight. Though as yet they are rather wild, our bag for the day was twenty-four broadbills, one readhead, one coot. In a tramp through the woods the other day, I came on several coveys of quail, and have learned since that they have done exceptionally well this season. Gentlemen coming here after Nov. 1, from present prospects and weather permitting, will have no cause to regret their visit. HENRY STOKES.

Adirondack Moose and Elk.

THE State of New York having liberated several moose and elk in the Adirondack forests, notice is hereby given that the killing of these animals is prohibited by law; and that the penalty of $200 for killing an elk, and $350 for killing a moose, will be promptly enforced.

The same penalties will be enforced where any person or party is found with a part of portion of said animals in his or their possession. By order of

Albany, N. Y.

Nothing for Himself.

"How much do you want for your services?" asked the amateur sportsman.

The guide noted the way his would-be employer handled his gun, and was thoughtful.

"Nothin' fer me," he answered at last. "It don't look to me like I'd need nothin' by the time you're through with me. But you'll have to take out an insurance policy on me in favor of my wife an' children afore I'll go."—Chicago Evening Post.

A Matter of Marksmanship.

Shotwell—Didn't you ever go shooting?

Sportless—Never in my life.

Shotwell—You don't know what you've missed.—Indianapolis News.

A Joke of the Year 1859.

IT is said that the hogs in Iowa have such long noses that the settlers employ them to plow the fields. The practice is to bury a corn cob on one side of the lot and place the hog opposite to it on the other side, when the porker scenting it, immediately digs his snout into the soil, and pressing forward turns a furrow equal to that made by the best plow right up to the cob. If a stump should lie in the direct road the Iowa hog does not hesitate, or work around it, but splits it open with his snout and goes on. This is following the nose to some purpose. —Porter's Spirit of the Times, Jan. 15, 1859.

In a prostscript to a note from Mrs. Carlyle to John Forster in 1849, the following incident is related: "I forgot to tell you I have got a little dog, and Mr. C. has accepted it with an amiability. To be sure, when he comes down gloomy in the morning, or comes in wearied from his walk, the infatuated little beast dances round him on its hind legs as I ought to do and can't; and he feels flattered and surprised by such unwonted capers to his honor and glory." That Carlyle's "amiability" soon grew to something very like affection for the dog is shown by what he wrote of its death eleven years later: "I could not have believed my grief then and since would have been the twentieth part of what it was—nay, that the want of him would have been to me other than a riddance. Our last midnight walk together (for he insisted on trying to come), January 31, is still painful to my thought. 'Little dim-white speck, of Life, of Love, of Fidelity and Feeling, girdled by the Darkness as of Night Eternal.'"

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

A Pearl River Camp.—II.

WE managed to preserve the dignity due such a momentous occasion until out of town, but then as the sun peeped up over the horizon disclosing all the beauties of "a day in June" in a semi-tropical country, we could no longer contain ourselves. Each house passed was saluted with three cheers and a tiger, until we became too hoarse to cheer, and then the big gun was fired as often as a man to serve it could be found. The good-natured colored man who drove us, entered heartily into the fun, adding a fine imitation of the rebel yell to our cheers. We wound up our noisy celebration with a yell all together, and an unusually heavy charge from the old gun, which we kindly allowed the driver to fire. It kicked him out of his seat, and forcibly reminded him of the fact that the road was getting sandy and heavy, and all hands should get out and walk. Our legs used up our surplus energy from that time until our arrival at the point selected for our camp on Long Lake.

It was high noon by the sun, but long past by our appetites, when we pulled up on a high flat bank of the lake near a cool spring in a grove of cypress and live oaks. Dinner for all hands was the first thing in order, and was eaten from our basket, under protest, as it was not in keeping with our preconceived ideas of camp propriety to eat home prepared provisions entirely, at any meal in camp.

We had allowed ourselves to be persuaded by the home folks into bringing—what we considered—an unconscionable supply of prepared food, quite enough, we thought, to last the entire week. We had vigorously rebelled against the suggestion, but as it was strenuously urged, had finally argreed that if we did have to carry provisions, it was optional with us as to whether we preferred home or camp cooking to eat, and once settled in camp, could do as we pleased. Dinner over and the horses rested and fed, we started our team back, with instructions to the driver to return the following Saturday for us.

"Now for fishing," said Jim, making a dive into the pile of plunder in search of tackle. He was promptly seconded by Will, but Walter and I issued an immediate and vigorous protest. We insisted that our camp should be built—we had no tent—before anything else was done.

It was a task to get them at it, but once started they worked well, and by mid-afternoon our home was done and we were ready to set up tent-keeping—we would have scorned to call it housekeeping. We had built what lumbermen call a shake-down or shack, and a very good one it was, considering we were boys, and on our first camp. It was 5½ feet high in front, with a sloping roof, which was about 2½ feet in the rear. Thickly covered with green twigs and limbs, the roof effectually kept off heavy dews, and was a sufficient protection from the light summer showers that might be expected. Nails driven thickly in the two front posts furnished pegs to hang our clothing and small articles on, and a couple of forked sticks set firmly in the ground near the rear end of the tent, made a very safe and convenient gun rack.

Our fire was built immediately in front of the shack, so that in the evening we could sit under shelter and yet be near its welcome light and warmth. It was about four o'clock when the shelter was completed to our entire satisfaction, and then Walter proposed that we rig up some rope pulleys on a convenient tree and draw our two baskets of provisions up out of the reach of any prowling hogs that might be around, so that our store would be safe during our absence, but Jim and Will mutinied and vowed that they would not do any more work of any kind until they had entered upon the real business of the expedition, which was fishing, so off we went to the lake, leaving the baskets of provisions sitting on the ground floor of our domicile.

Hastily collecting our tackle, we rushed down to where the boat was tied, each trying to be first. Jim won, and jumping into the boat, heedless of the three inches of water in the bottom, made his way to the middle seat, where, after one glance into the fish box, he turned and fled back to the bank, shouting that somebody had bored the boat full of holes.

Indignant and excited we rushed to the boat, which we quickly pulled up so as to permit of careful examination, and found Jim's excitement caused by a boarded up fish box, built in the center of the boat, with perforated bottom.

This ingenious contrivance was a revelation to all save Walter, but when he had explained it to us Will and I, boy like, shouted and howled in the most derisive manner at Jim for his mistake, which might have been either of ours if he had not outstripped us in the race for the boat. We soon got to fishing, and Jim wiped out his humiliation by catching the first fish, a bream of ½-pound weight. We were fishing for bream, as the only bait available was our roaches, and no other fish would bite at them. Our outfits were long, light cane poles, fine silk or grass lines, a quill for a float, a B.B. shot and a very small fine hook. This light tackle made it great sport to catch this gamy fish that ran from ½ pound to 1½ pounds in weight.

We paddled slowly along, well out in the water, and fished in toward the bank. The fish bit well and we kept busy. Frequently two of us would be pulling in a fish at the same time. It was glorious sport, and no suggestion was made to quit until the lengthening shadows warned us that the sun was down and it would soon be dark. Arrived at the landing, we secured the boat and proceeded to put up our tackle and count out the fish, Will going on up to camp to build a fire and have things ready for a fish supper. A few moments after his departure we heard him shouting in a most excited manner, and then came the sound of five shots in rapid succession. Dropping everything we rushed to the rescue, believing that our companion had been attacked by some one or something.

He was standing near the camp holding the smoking revolver in his hand, from which the shots had been fired, and it took but a glance to see what had caused his excitement. The semi-wild hogs that roamed the swamps had found our camp during our absence and had raided it.

The generous supply of good things put up by the home folks for our enjoyment had been effectually disposed of, and apparently appreciated. Breads, jellies, preserves, cooked ham and tongue, cheese, butter and cakes had been eaten, or walked over until destroyed. A careful search revealed that, of the clothes basket and large market basket of good things, there remained but a small side of bacon, torn and trampled, a small bag of salt and half a sack of corn meal torn in several places, and badly mussed up. To say that there was consternation in the camp is but a mild statement of the case. The utter loss of these, heretofore undesirable, provisions, together with further calamity that our bedding, clothing and other duffle had been rooted around in the mess and pretty thoroughly mixed in with the broken glass, spilled jellies, preserves and other foreign substances, made our troubles almost greater than we could bear.

Night was falling fast, we were miles from any house, thoroughly tired out and ravenously hungry. Will said that there had been four or five hogs in the drove and that they had made off on his approach, hastened somewhat by the shots fired at them from the revolver, which was the first weapon he could find.

We were pretty effectually discouraged, but soon sat to with a will to try and put things to rights. With plenty of fish for supper, the skillet intact, and bacon to fry with, we could at least ward off starvation. Fortunately the night was very warm, and enough bedding was found in condition for use to make us reasonably comfortable, but in searching it out from the confused mass we found enough damage done to the remainder to cause us very uncomfortable sensations when we thought about the joyous homecoming, and the reckoning with our several families who had furnished bedding under protest and given strict orders for its especial care. We were further worn out and both cross and sleepy, when we finally straightened things out and turned in to prepare supper. Fish was what we all wanted, and our afternoon effort had provided what we believed to be an abundance for at least two meals. Jim and I cleaned fish, Will prepared the fire and cooking utensils, while Walter took the side of bacon down to the spring to undertake the difficult task of making it fit for use.

"Let's clean all the fish to-night," said Jim, "and then we will not have to do any thing but cook breakfast when we get up." This was a wise suggestion and we acted on it. All the fish were nicely prepared, and soon we sat around the fire watching them cook and impatiently awaiting the summons to fall to.

Walter was cooking, and the air was laden with the odor of fish turning brown, which made us too hungry to talk. The first meal in camp to those interested is only second in importance to the one prepared by "Dovey" for "Lovey" at their first appearance under their own vine and fig tree, and the former is accompanied by appetite, while the latter is sans any sensation except ecstacy. Anyone of the four hungry boys who ate fish, and fish and more fish that night, can now honestly say that nothing better has ever tickled his palate. Of the generous supply of fish, sufficient as we thought to furnish supper and breakfast, there remained after supper not a single one, and the bones were all picked over a second time. Abject want might meet us on the morrow, but for the night all was well. Tidying up after supper in a hasty—but for tired boys commendable—manner, we proceeded to prepare for early bed. Jim and Will elected to stay by the camp, while Walter and I foraged for a supply of wood to keep the night fire, a neglected duty which we now truly regretted. It was very dark and lonesome out of the circle of light cast by the fire, and we hoped it would not be necessary to go very far. We finally found a large dead limb which we laid hold of, one on each side, and started to drag to camp.

We had proceeded but a short distance with our burden when Walter stumbled over a large dark object and fell to his knees, his disengaged hand coming in contact with the obstruction which was covered with coarse hair. With a yell of terror he sprang to his feet, and instinctively hanging on to our wood, we tore along toward the welcome light of the camp fire. As we bore down on the camp with our noisy load the two boys, already larmed by Walter's cry, became entirely panic stricken, and dashing into the tent scrambled back as far to the rear as possible and pulled the bedding over themselves. After a hasty consultation we concluded best not to further alarm our two companions by telling them the particulars of our scare, so mending the fire and placing our weapons convenient in case of further alarm we all turned in.

LEWIS HOPKINS.

[TO BE CONTINUED.]

A Trout that had a Hard Time.

GLENS FALLS, N. Y.—*Editor Forest and Stream:* I send you to-day by express a package containing the head of a brown trout, which I think quite a curiosity and well worth saving. This fish was caught on worms and in a brook within half a mile of the corporation. It measured just eighteen inches in length and weighed two pounds and one ounce. The writer did not see the fish until the head was cut off, otherwise I would have secured the entire specimen. I would like to know if you have ever seen or heard of anything like this before.

W. J. GUTHRIE.

I never knew two men to spend one Arctic night together without wanting to kick each other ever afterward.—Dr. F. A. Cook.

Swedish Trout Fishing.

The Earl of Mayo in the Nineteenth Century.

THE two hares had finished their gambols on the stony, black shore of the stream. The woodcock had flitted out from his haunt on the pine-covered mountain. The rising moon silvered the ripples as the little wherry was sculled slowly on; a chill came in the air, as the west wind blew from the Norwegian fells.

The big trout with the square taill lay on the bottom of the boat. What a struggle he had made, and how nearly had he rushed to freedom down the rapids and away, among the foam-covered rocks! Larger fish had been killed, but none had fought so stubbornly. His last gasp was given as the landing-net dragged him to the edge of the boat. The steel trace held well, and there was not a scratch or mark on the bait—a phantom minnow.

My boatman Johansen had rowed steadily, and the lines swept in graceful curves as we passed across the treacherous rapid. A broken scull or an awkward movement would have resulted in one, if not both, of us bidding farewell to this world.

We turned again; again the baits spun true through the clear water; a snatch, a whirling reel, and the fish is fast; a clumsy leap in the air shows his shape, and now the fight begins.

Up into the still water he bores his way, then down to the rapid across to the shore, then comes a steady tug of war in the deepest water; finally the contention ends in a sandy bay, where the big trout circles round and round our little boat.

There was a moment one felt it would have been a relief if the hooks gave and the fish swam free and away.

No trout fight so stubbornly as the large Swedish trout, called in Sweden Lax Oren. They are found late in August and at the beginning of September, lying at the head of rapids where the rivers leave the lakes, or at the head of rapids joining a series of lakes.

During the summer in Sweden, trout may be caught in great quantities with the fly; in fact, on some days and in some places one may take a sackful.

The charm of the autumn fishing is the quiet of the surroundings. No mosquito haunts with his singing and his stinging the "anglers' rest" I write from. When fishing, the only sound that breaks the air is the monotonous thud as the sculls work in the rowlocks, and the creak of wood working on wood.

A char rising makes a slight ripple. The pine woods look down in eternal silence as the darkness of evening draws on. One hears the children calling the cattle down from the forest, and a little curling smoke goes up from the red wooden houses.

My stolid Swede, at a sign, turns the boat toward home, and one strolls up to the little Posting House contented with the delicious air and the repose of such a life.

Fishing from a boat in Sweden is done as follows: Two rods are used, set exactly at right angles to the keel of the boat. One sits facing the stern waiting for a "run," and watching the shores slowly receding as the boat glides smoothly on.

Let me now turn to my Journal of a 30th of August. This 30th of August was a typical day; not a big trout day, but a satisfactory day's sport.

We started about 10 A. M., Johansen sculling up stream from the home water to some rapids a mile and a half away, called "Lap Strugen" (the Laplanders' stream). We rowed up the rapids and down the rapids, and the bag for the morning is five trout, one char, one grayling.

The grayling in Sweden are very numerous, and become, when fishing with spoon and phantom a nuisance. They are continually running at the bait which means catching fish, but with a long line out the continual reeling up of the line and taking off a small grayling becomes tiresome.

The largest trout of the bag caught this morning in August weighed nine pounds, the next largest three pounds. This nine-pounder gave great play, being a cock fish newly come up to the spawning grounds, and as I tried to slip the landing net under him the hooks of the artificial minnow caught in the meshes, the trout hanging in the water; finally with much anxiety and some excitement, I slipped my fingers into his gills and lifted him gently into the boat.

My boatman, before the crisis arrived, had with difficulty reeled up the line of my other rod, now sculling, now stopping and snatching up this second rod and reeling in the line as fast as possible. If this is not done one finds oneself in this dilemma: a big trout on one rod, oneself standing up in a "cogglesome" boat going down a rapid, playing this same trout with every chance of the hooks on the line of the second rod catching in a rock. Expletives split the air, unheeded by your stolid boatman, whom even an earthquake would not move. When all is said and done, fishing with two rods from one of these small wherries gives as good chances for temporary disturbance of one's temper as an awkward gillie trying to gaff a not fully played-out salmon.

These large Swedish trout are excellent eating, their flesh being of a rich red color.

The fish are netted in quantities during the autumn season by means of short nets set cunningly where the waters of the rapids whirl and eddy round the rocks. As they work up stream and round these eddies they get meshed and caught. The nets are of fine twine with corked top line, and weighted with stones neatly tied up in little birch-bark bags. The fish are salted in barrels for winter use. In the northern parts of Sweden the farmer depends greatly on fresh-water fish for winter provender. In Swedish Lapland further north, not near where I write of (i.e., in and near the Arctic Circle), one never sees a Lapbunder's house (i.e., a settler or Lapland farmer) except it be built by the side of river or lake. In these parts where frost reigns eight months in the year the soil can produce little or nothing. I have seen a fine crop of potatoes utterly cut down by an August frost; it must, however, be said that this was well within the Arctic Circle. Sportsmen and anglers must not rail against this netting of trout, which means food for the sturdy peasants. Trout there are in plenty for all—farmers, fishermen and tourists.

The trout fishing in northern Sweden is practically free to everyone; in the South it is no so. Fishermen will find it better always to give away all fish that is not wanted for their own eating; if this is done no objection will be raised by the farmers to fishing anywhere in northern Sweden.

No kinder or more obliging people exist than the Swedish peasantry; the trouble they go to and the help they offer you on your journey, making you as comfortable as possible, takes one somewhat aback when first traveling about the country, and I may truly say I know the north of Sweden better than many Swedes.

The great drawback to the far north of Sweden is the mosquitoes; they are a perfect pest. If it is hot a mosquito veil is unbearable, and the only thing to do is to smear one's face and neck with a mixture of grease and tar. Housemaid's chamois leather gloves must be sewed to the sleeves of one's coat for fishing in. By this means these stinging terrors may be defeated. A flannel shirt must be kept for use when the war paint of grease and tar is assumed; this shirt should have a large turned-down collar to protect the collar of the coat from the black smear. Night brings little rest, and a mosquito curtain is the only preventitive. This must be absolutely secure, as I firmly believe twenty Scandinavian mosquitoes would keep an entire army corps busy most of the night. If, however, the fisherman is determined to brave this pest, the best time to arrive in the far north is to make one's plans so as to reach the fishing quarters during the middle of August, and leave when the cold of September comes on, and the fish no longer take.

Boat fishing, for large trout up north is cold work, and for several years I could devise no way of keeping warm—i.e., in September.

Winter clothes of best home-spun, underclothing thick as for hunting in England, a fur coat with a waterproof over it, and a cap with ear-flaps completes the costume of the upper part of the body.

As to your nether limbs: the little boats you fish in always leak more or less; wet feet mean colds, and rubber boots are very chilly footgear. Wear a long leather boot which comes above the knee, under this thick riding drawers, and over them a pair of knitted woolen long drawers, such as are sold for wading in when salmon fishing in the early spring. No one has any idea how the wind in the north penetrates the thickest of clothing.

Now as to food. Milk, cheese, flat bread, a large folded up limp sort of biscuit made of flour and water, "Kenicky" break (spelled as pronounced), and the berries of the forest as well as the fish one catches are the foods one is certain to find. These should be supplemented by cocoa, some tinned meats, and soup squares, which are excellent, but take somewhat long to prepare; also soup cartridges (good, and only require boiling water). Of the fish you catch the red-bellied char is far and away the best eating.

A fresh caught char grilled on a wood fire is most delicious, and the best fresh-water fish I know of.

Inside the Arctic Circle I know of one place where char run to four pounds in weight; they have been caught with rod and line, but are not common.

Anglers will ask, are there no salmon in Sweden? The answer is, they are plentiful.

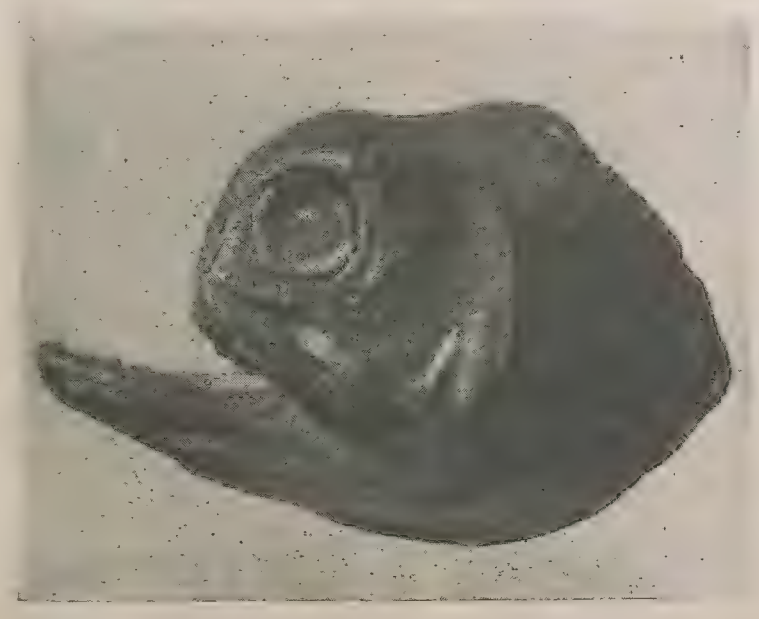
In the south of Sweden, in rivers like the Falkenberg near Gothenburg, these fish rise to the fly. I have yet to learn that in the rivers running into the Gulf of Bothnia (i. e., on the eastern coast of Sweden) *Salmo salar* will rise to a fly or even is easily taken with rod and line and other lures but the fly. I trust some of my readers may inform me. I speak of salmon being so caught within the last ten years. As I close this short account, let me say Sweden offers many attractions to those who wish for a real holiday. Living is cheap, traveling also. Comfortable steamers ply to all ports on the Swedish coast; they all have excellent restaurants, and the cleanliness of Swedish houses is proverbial.

The "circular-ticket" tourist has not yet arrived; perhaps he may come. I doubt it, as Norway with its marvelous scenery is more attractive. Let anglers try Sweden for a change.

MAYO.

* The trout weighed twelve English pounds.

The following announcement appeared not long ago in the Tribune du Sud Ouest, Mantauban, France: "According to our old custom both editorial and composing staffs will take their holiday from this day onward. After a fortnight's well-deserved rest we shall, one and all, return to our respective posts to carry on the struggle in the interests of our dear city, of liberty and of the republic."



A TROUT THAT HAD A HARD TIME.

Fish and Fishing.

Brook Trout in the St. Lawrence.

ONE of the wardens employed by the Sportsmen's Fish and Game Protective Association of the Province of Quebec, to watch the markets and incoming boats and trains for infractions of the fish and game laws in the city of Quebec, visited one of the fish markets last Friday morning, and found that a dealer from the parish of St. Pierre, on the Island of Orleans, had a trout about ten inches long among his other fish. The fish was, of course, confiscated, though when the man had told the story, it was decided not to prosecute him in court. He proved that he was the proprietor of a properly licensed "fishery" or weir running out from his land on the Island of Orleans, into tidal water, almost opposite, but a short distance below the Falls of Montmorenci, and that he had found this trout with the other fish in the trap of his fishery. Most of the fish taken in these traps are eels, which are of course alive when taken out, even if they had been some time out of the water. The whitefish, striped bass, shad, pike-perch, and various other kinds taken in these weirs are usually dead when taken out of them, and though the fisherman had no right to have trout in his possession during the close season, the authorities did not think it advisable to enter an action which many people would have considered persecution instead of prosecution, and he was consequently admonished and sent on his way. The trout might have been dead, as he alleges, when taken out of the trap, which was set for other fish, but if he chances to take another during the close season, in the same manner, he will probably use it at home, and avoid the risk of exposing it for sale in the city of Quebec. Had this case come before the court, an interesting point would probably have been raised by the defense. There was an evident desire to prove that this particular fish was not exactly the speckled brook trout of our fresh-water streams and lakes (*Salvelinus fontinalis*), but a sea trout. It is exceedingly difficult to say how the court might have decided this question, for while I was sent for to the court to examine the fish and found beyond any question of doubt that it was a spent female *Salvelinus fontinalis*, there are those here, as well as elsewhere, who seem to think that different habits alone constitute different varieties, and the fact that this specimen was taken out of the St. Lawrence, not many miles above brackish water, would be deemed sufficient by some of them to depose that it was a sea trout. It certainly may have been on its way to the sea from the river in which it spawned, but this does not of course affect its classification, though it will probably lead to an application to the Dominion Government for such an amendment to the law as will remove all doubt as to its intention in such cases as the present.

Instances are very rare in which speckled brook trout are taken out of the lower St. Lawrence, though sea-run individuals are exceedingly plentiful in the bays and estuaries of rivers when the fish are about ascending them to spawn. None of the rivers as high up the St. Lawrence as St. Pierre are frequented by sea trout, however, and there is no river of any kind near the bay in which this fish was captured. It was probably a Montmorenci River fish. The Montmorenci River flows into the St. Lawrence a few miles above St. Pierre, on the mainland, hurling itself into the bay at its mouth over a precipice 250 feet high. In its upper waters very large brook trout are taken on the fly, and fish of four and five pounds weight are sometimes caught by anglers in the deep, dark water immediately below the falls, where the spray of the cataract is so dense that waterproof clothing is a necessity. There is no doubt that these fish have descended the cataract, though how they have managed to do so, uninjured, is really wonderful. Diligent inquiry during the last few days has brought to light two or three other instances in which trout have been taken in weirs off the Isle of Orleans, and there is one well-authenticated case in which a specimen was captured by a small boy with rod and line, who was fishing for tomcods from one of the city wharves, with pork for bait. There is nothing astonishing in the fact that trout should be found in a river like the St. Lawrence, into which so many magnificent trout streams empty, but from the very few specimens which are taken in its fresh water, it would seem that those spawned fish which descend from rapid water to the big river, descend at once to salt water.

E. T. D. CHAMBERS.

A Cast of 140 Feet.

SAN FRANCISCO, Oct. 12.—H. C. Golcher set a new mark for long-distance fly-casting yesterday at Stow Lake, Golden Gate Park. In a regular contest of the San Francisco Fly-Casting Club he sent out 140 feet of line.

The previous record was 134 feet, held jointly by Mr. Golcher and by Champion Walter D. Mansfield. The former made his cast on Aug. 23, Mr. Mansfield having some days previously established the record at the world's championship tournament.

While angling on a trout stream the majority of casts are made at from 30 to 50 feet. This indicates the high development to which the casting has been brought. There is no weight attached to the line. It is tipped with a tiny hook from which the barb has been removed. Yesterday's scores in detail:

	Event No. 1, Distance, Feet	Event No. 2, Accuracy, Per cent.	Event No. 3			Event No. 4, Lure
			Acc. %	Del. %	Net %	Cas %

A man was standing in front of a Saranac Lake market recently. He had a basket and a fishing-rod. "Just throw me a dozen perch and bullheads," he said to the owner of the market. "Certainly," replied the owner, "but why do you ask me to throw them to you?" "So I can go home and tell my wife I caught them," was the reply. "I may be a poor fisherman, but I am no liar."—Shooting Times.

CHICAGO AND THE WEST.

Plenty of Anglers.

CHICAGO, Ill., Oct. 25.—More than forty anglers outfitted in Chicago to-day for trips to different Illinois waters. The weather is fine, and I suppose the boys figure that this is about the last chance they will have for the bass this fall. Among those who left for Lake Villa, Moon Lake, Fox Lake, Deep Lake and Cedar Lake in upper Illinois, are the following: Messrs. George A. Murrell, W. B. Rowe, D. C. Lambeth, H. Miner, Charles Lawrence, B. A. Ahrend, G. E. Anderson, L. P. Hasen, W. G. Garrett, Paul Paulson, N. H. Miniter, Thomas Hopcroft, T. Schultz, C. M. Hanson and party of five. These ought to meet some success. The demand for live frogs exceeded the supply to-day, and at 11 o'clock there were only two dozen frogs left out of Von Lengerke & Antoine's stock, where most of the live frogs are sold to Chicago anglers.

Mr. H. M. Pike, of Whatcom, Wash., sends to a friend in this part of the world the tracing of a 5½-pound trout which he caught in Lake Whatcom on Oct. 5. He calls this a "lake trout," meaning perhaps by this the Dolly Varden, although one cannot be sure. The fish was taken in thirty feet of water and fought for an hour and ten minutes, though it did not demand over 100 feet of line at any time of the engagement. Mr. Pike says that ten pounds four ounces is the record on lake trout this year in Lake Whatcom. The fishing is all bait-fishing, salmon roe being the bait. He adds that an expert fly-fisherman of that locality one evening about Oct. 1 caught ten trout on the fly in Lake Padden the catch weighing 20½ pounds.

Mr. Pike says that there are some ducks in his part of the world, and that within ten miles deer and cougar are obtainable.

In regard to the Pacific coast salmon he says: "When I came to the coast five years ago, I had salmon in my eye, but I find this fish no more like the Maine salmon than a pig. The lake trout are our game fish, and they are game to the heart's core. The month of October is the sportsmen's month on the coast. Eastern sportsmen are not aware of the resources of this country. Two hundred miles north of Vancouver a man can get his fill of any sort of sport."

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Theory as to Stocking Salmon Rivers.

MR. G. T. TEASDALE-BUCKELL, for fifteen years editor of Land and Water, has an interesting letter in the Times of Sept. 18, in which he says:

"Mr. Charles Dixon has written a very interesting letter drawing a parallel between the migrations of birds and fishes. But he appears to confuse instinct and memory. For instance, he believes it to be necessary for an older generation to be present to show the young the way. But this is not instinct, but memory; and the latter can have nothing to do with the migrations of those birds whose young leave their breeding grounds and migrate before their parents; and such birds there are. Whatever the migratory instinct is, it does not appear to be memory; the greater part of bird migration goes on in the night, and we have yet to discover a sixth sense, unless instinct be a sense that is assisted by the darkness.

"If the salmon relied upon memory there does not appear to be any good reason why it should not return by the path it went to the sea; but if it acts on impulse alone, and that impulse is bred in the bone, there does not appear to be any reason why a grilse should make for the river in which it was bred or why it should not make for its ancestral river.

"Mr. Charles Dixon's views have been previously expressed by me in Land and Water, of which paper I was editor for fifteen years after the death of the late Frank Buckland, and last February I was permitted to state the same views in the County Gentleman; but although I consider that the greatest importance is due to instinct in dealing with salmon culture, and that salmon bred in one river from ova gathered from another would return to the latter, and not to the former, yet I do not believe that precludes the restoration of a salmon river, although its breed of fish have become extinct. But, in order to do this, I would suggest that hereditary instinct must be broken down by crossing, and when this is accomplished the river intended to be benefited may have just as much, and no more, chance of benefit as every other river on the coast, or, perhaps, in the Continent, where the operation has been conducted."

There may be a good deal in what Mr. Teasdale-Buckell says, but on the other hand there is no doubt that the Yorkshire Esk, for instance, was stocked with salmon reared from eggs taken from other rivers, and other instances might be mentioned.—London Fishing Gazette.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

No. 3.—Tackle Books for Novices.

THE beautifully made fly-books and tackle boxes sold by the fishing tackle dealers are the result of the long years of experience of thousands of anglers, and are generally worth all one pays for them. But as the novice usually makes some mistakes before he finds just what will suit his tastes, the following plan may save him a few dollars in the end. At any stationery shop he can purchase for a dollar or less a large pocketbook or wallet intended for carrying greenbacks or checks without folding them, and other valuable papers, in one's inside pocket. The variety best suited to the angler's needs is generally made of stout canvas, has six or eight full-length pockets and several smaller ones. The outer covering is leather. In size such a wallet is about four by nine inches, and should have an elastic band over all.

In use the large pockets will contain bass and trout flies, spinners, spoons, snelled hooks of various kinds and sizes, leaders, floats, sinkers, artificial baits, stringers, spare lines, a repair kit of thread, wax, shellac, etc., and no end of junk the angler accumulates in a season. But the best feature of this homely tackle book is that there are pockets enough to keep each variety of flies or hooks in its own separate compartment. Unlike a rigid metal box, it may be stuffed into one's hip pocket, or under his belt, or tossed about without fear that the contents will spill out, or that the hooks may penetrate the outer covering to prod one at the wrong time and place.

A receptacle of this sort is less serviceable than a regular fly-book for one who uses the fly exclusively. Neither is it so valuable as a tackle box to one who uses no flies. But for the angler who employs bait or flies, according to circumstances, and especially to the novice, this book offers many advantages. Try it.

Canine Elegies and Epitaphs.

XXVI—Satan.

Could not thy potent name, oh Satan, hold thy breath,
Secure against the fatal tyranny of Death?
Must thou, too, yield to his determined call,
As Adam did when Adam had a fall?
Do Man and Dog one common law obey?
Are both composed of one congenial clay?
If so, what difference is there 'tween a man and dog?
For a dog may be a man, a man a dog "in cog."
But man, by Death, to future life is led,
Whilst dogs, by Death, are made forever dead.
Oh, for some Dogberry's book to write thy fate in,
Poor used up, dead, annihilated Satan!
A dog must have his day; and thine is past;
For dog days, Satan, are too hot to last.
Thy bark upon life's stream was sorely tossed;
But now, alas, thy little bark is lost;
And Dr. Smith alone remains to wail
The sad relation of thy little tail.
Thou couldst not make a pill or spread a plaster
To aid the business of thy worthy master;
But all his "whine and bark" he had from you,
And that was doing all a dog could do.
Requies-cat! I'd say, since Death has broke the lease,
But where there was a cat you'd have no peace.
I cannot of your wit, poor Satan, brag,
Although your tail, 'tis true, was quite a wag.

—Dr. Northall.

Fox Hound Trials.

THE following circular will be of special interest to fox hunters:

Fox hound pack field trials, to be run at Westbury, Long Island, N. Y., to commence on Wednesday, Nov. 5, 1902.

For the best packs of fox hounds in field work, open to the packs of recognized hunts, and to such private packs as may be approved, by subscription of $50 for each pack, p. p., the value of the purse guaranteed to be $1,000, of which, in case of four or more starters, $800 to first and $200 to second.

Any hunt entering a second pack shall be allowed to do so by designating the same as No. 2, and paying an entrance fee of $25; but the same hounds shall not run in different packs.

Entries will close on Friday, Oct. 31, 1902, to Ralph N. Ellis, Westbury, L. I. The right is reserved to reject any entry. The name of every owner or part owner of any hound that is to be run with any pack must be stated in the entry.

The packs will be limited to 7½ couples of hounds each, and 7½ couples must be run, unless, in the opinion of the judges, there arises a good and sufficient reason to reduce the competition to not less than 6 couples; but not less than 6 couples must be started. In case the judges determine to make any reduction in the number of hounds to be started, the reduction must be made uniformly in all competing packs.

The individuals of each pack must be named in writing to the judges on the morning of the day when each several pack is to run its first trial, and no substitution of hounds will be allowed throughout the trials, but in case of the loss or death of any hound or hounds the judges may permit and may require the substitution of other hounds in their place, as the best interests of the trials may, in the opinion of the judges, at that time require.

All hunting will be after wild foxes only, and no drags, nor drop foxes, nor placed foxes will be allowed.

Each pack will have three trials or hunts, and no trial shall be considered as such unless a fox is actually found. No pack shall be required to hunt on two successive days, but may elect to do so. Each pack will be judged upon its average performance during not more than three trials. Any hunt may elect to stand on its performance on one or more hunts, but shall have the right to complete its three trials before the competition is concluded, if the master of such hunt deems it advisable to take all or any of the further trials to which such pack may be entitled; provided, that the judges may, in their discretion, order any such pack to take all or any of such further trials (not exceeding three in all), if, in their opinion, any difference of hunting is due to the inequalities of scenting conditions.

The judges may, in their discretion, conclude the competition on not less than two trials or opportunities for each pack, if, in their opinion, each pack has had a fair opportunity in the competition.

If, upon the completion of the three trials to which each competing pack is entitled, a majority of the judges cannot determine which pack shall be declared the winner, they, the judges, shall have absolute authority to continue the trials in any manner they deem necessary to reach a conclusion.

There will be three judges. If any judge is unable to act as such, the other two may act without any third member, or may select a third judge to act with them. No judge shall be interested in any manner as owner or part owner or lessee of any competing hound. The judges shall not disclose to any person whomsoever any of their deliberations or decisions in regard to the trials until the results thereof are made known publicly to all of the competitors after the trials are completed.

The judges will designate the hour and place of meeting for the trials of each day.

The judges will have absolute authority and discretion in all matters relating to the running of the packs in the field and all other questions of every kind that may come up; and their decision in all matters relating to the trials will be final. The judges may order any person from the field, if, in their opinion, such person interferes in any way. In case the judges deem that any interference has affected the hunting of the pack, they may declare that trial void. The judges may, in their discretion, disqualify any pack from participation in the competition, or from receiving any award therein, if the majority of the judges deem that the competitor has violated any of the commonly accepted rules or conventions of the hunting field. The judges may, in their discretion, order two competing packs of hounds to be put down and run at the same time.

Stabling and kenneling accommodations will be provided for all competitors.

Tomkins' Lurcher.

"HULLO, Tomkins! You've got that ugly brute of a dog of yours in our plantations again, eh?" This was the shout of a tall, burly keeper to a man of withdrawing appearance, silent as a general rule, dressed in workman's coat, and accompanied by a large ugly-looking yellow lurcher. The dog seemed to have caught much of the shy character of its master; following close at his heels with an uneasy glance, first toward the right hand, next to the left. It was not a propossessing animal. Neither you, nor I, gentle reader, would care to see it near our game coverts. Still, there appeared no harm in the dog, and most people would have left it severely alone, as it had a decidedly fierce look when it opened its jaws and showed two ridges of white teeth.

"We are on the path and doing no harm, Mr. Kenton," answered the man apologetically.

"You may be doing no harm when you see me about, but when I am away what is that dog for?"

"It is a favorite pet of my poor sick wife, sir, and I don't like to part with it, being, which it is, quite harmless. It never looks at a rabbit or hare, I do assure 'ee."

"Nonsense; I don't believe you. I'll bet you a sovereign that if that dog were told, he would at once catch a hare."

The insignificant old man looked up. Another man was hurrying down a path at right angles to the one he was pursuing. He thought a moment and then said: "Excuse me, Mr. Kenton; I'll take you. I am not much of a betting man, but in this case you shall not be disappointed. Mr. Freebody!" and he shouted aloud to the other man, "Mr. Freebody!" That gentleman stopped and they walked toward each other. "Mr. Freebody, the doctor, is a friend of yours, I think, Mr. Kenton. We will ask him to hold the stakes." Accordingly the silent man pointed out to the doctor the ugly, sleepy-looking dog, and bet a sovereign with the keeper that it would not and could not run after any game whatever, and that it should be allowed any one (as well as its owner) to urge it on. If it took no notice of any such encouragement he, its master, should receive a sovereign from the keeper. If, on the other hand, it did pursue or in any way take notice of game however cheered on, he, its owner, though sufficiently poor, would pay the keeper his sovereign.

"The conditions seem fair enough," said the doctor "I will gladly see fair play. Each of you hand me his sovereign." This was done, and they walked together to the next field, where a hare jumped up and made the best of her way to a little copse. The silent man showed the dog the flying animal, egged him on, and cheered

him—"On Peter Loo! on! At him!" But the only result was that the dog drew nearer to his master and did not turn a hair with eagerness. "Perhaps you will now try him yourself, sir?" asked the dull-looking man of the keeper. "You stay here," replied the keeper, "and Mr. Freebody and I will try by ourselves. The doctor will look after your interests."

"I am quite satisfied," rejoined the dog's master. "Take him with you." Mr. Kenton rather shrank from so Satanic a dog, but at length, by snapping of fingers and much encouragement, they tempted it into the next two fields while its master remained behind sitting on an old harrow.

"Well?" asked he, when, after some time, they returned with Peter.

"Oh, he is wrongly suspected," said the doctor, "he is quite harmless to game; we tried him in every way, and he would not look either at hare, pheasant or rabbit." As if to justify his words up jumped a big jack hare and both the doctor and the keeper at once set on Peter with abundance of "Yoicks!" "Loo! loo!" "At him, then," and the like. The dog looked supremely insulted and walked slowlly to its master, lying down by his side. Kenton scratched his head and seemed much astonished, while the doctor handed over the two sovereigns to the silent man, with a cheery word to Kenton about the horse a man backed not always winning, and then, rubbing his hands together, said: "Good-by to you both. I must get on to ease poor Riggall, who lies near Pope's Corner with a broken leg."

A few days afterward the doctor fell in again with Tomkins and said: "Well, now, Tomkins, I want you to tell me your secret. Every one knows that brute of yours must follow its kind, and it is certainly a poaching dog."

Tomkins looked around and said nothing. They were standing much about where the wager had been decided. There were no signs of the keeper. It was a dull autumnal evening. The dog pricked up its ears as if it expected something. Tomkins walked hastily to a neighboring patch of gravel and weeds. Up jumped a fine hare, and the dog looked at his master, who said, "Come to heel, Peter!" and off flew the lurcher, gaining upon the hare as it rushed into a pasture field, and in a very short time running it down. Tomkins ran up and, speedily killing the hare, stowed it away in one of his capacious pockets. "I don't quite see the meaning of all this," quoth the doctor. "Then I will tell you, sir, though I dare not show you my system any more in operation. I have taught the dog to do the exact contrary to what I say. Thus 'Fetch him! Loo!' means really 'Come to heel!' and so on with every command. You have seen how this plan brought me in a sovereign, and you can fancy how utterly puzzling it is to the keepers to see a dog which, when set on a hare (and I often do it on purpose), at once slinks back and never so much as looks at game. But I hope you will keep my secret, sir, for you see I have trusted you with it."

And so they parted; the doctor having learned one more trick of the poaching fraternity.—London Illustrated Sporting and Dramatic News.

A Vermont Mode.

SPRINGFIELD, Vt., Oct. 21.—Last week I spent another delightful week at my log cabin camp, of which I have already made mention in one or two sketches of woods life, published in FOREST AND STREAM.

Thursday morning Mr. J. W. Currie, one of our crack fox hunters, arrived at camp with two good hounds. The morning was warm and damp, ideal for the sport. We loosed the dogs, who disappeared at once, while we went to our favorite "stands." Below us spread a valley and beyond another range of wooded hills, all ablend of browns, reds and yellows, over which the cloud shadows crept. It was one of those autumn days that make the heart of a sportsman swell in his breast. Suddenly from far below in the thick swamp rose the long, half-sad cry of a hound, whose delicate nostrils catch the first faint aroma of a trail already cold. And then for half an hour we watched the marvelous unraveling of that maze of windings made by Reynard in his nocturnal hunting.

A sudden burst of music, the glad full cry of hounds in hot pursuit, and down through the woods across the swamp and up the opposite slope into full view, came fox and hounds. Over the ridge the cry died away and then came swelling back as Reynard made his first turn; back across the valley and up the hill on which we stood where the music suddenly ceased.

The hounds came and whined their invitation for us to follow them; they led straight to a woodchuck hole, where they assured us they had driven Reynard to earth.

We brought bar and shovel from the camp and started in to dig him out, but found a network of winding passages; the task seemed hopeless, so we gave it up, and the hounds followed us reluctantly back to camp.

After a good dinner we discussed the run over our pies, and about 3 P. M. started out to find the dogs, who had long since disappeared. We found them at the hole, and they had dug so they could crawl in six or eight feet. They were impatient and bayed loudly with rage and disappointment.

In the hope of driving the fox out and giving us another run, we tried smoke. Gathering dried ferns, we made a smudge at the lower opening. By good fortune the draft was right, and smoke poured from the upper hole. Reynard could be heard to sneeze and cough, but refused to jump and have a run for it; instead, he came down to within three feet of the smudge and we could hear him digging furiously for several moments, then we heard no more. Making a hole over the spot, the writer put in his hand and drew out a magnificent dog fox. The dogs were allowed a few good shakes by way of encouragement and to relieve their feelings, and bearing our trophy we walked slowly back to camp by the light of a glorious crimson sun, whose last rays lingered affectionately on the rugged hilltops; those hilltops where never again one sly old fox would turn to laugh at the baffled hounds. The pelt, an extra fine one, was presented to the cabin by Mr. Currie, and will occupy a place of honor over the stone fireplace.

There are two interesting facts to note, first a fox driven to earth by hounds will suffocate rather than jump out to the dogs. Second, this fox, though one of the largest we had ever seen and very full, tipped the scales at barely ten pounds, which proves that the weight of this animal is usually grossly exaggerated by hunters.

W. W. BROWN.

Wolverly Wallie.

NEW YORK.—Considerable surprise was expressed by several experts that the Skye terrier Wolverley Wallie, which attracted so much attention at the exhibition of the Ladies' Kennel Association of America should receive only the third prize, a number of those best qualified to judge claiming that on many accounts this dog was one of the most remarkable ever shown at an exhibition in this country.

The coat of the dog counts fifteen points in the trials. Wolverley Wallie has a coat such as has never been seen

in this country before, the hair from the middle of his back reaching to the ground, and beneath this comparatively coarse outer coat is a soft under coating of short hair, which marks the Skye terrier and is very soft and downy.

Wolverley Wallie is owned by Mrs. Robert H. McCurdy and was imported from England, and as a prize winner in English exhibitions his record is unequaled. He was the winner of two challenge prizes, and of the first prize and special prizes in the Ladies' Kennel Association, Botanic 1900, Manchester 1901, Harrogate 1901 and several others.

SPECTATOR.

Philadelphia Show.

PHILADELPHIA.—The following judges have accepted invitations to judge at the Philadelphia Show in addition to those already announced: Reginald Mayhew, fox terriers, black and tan terriers, Scottish terriers and toy dog; and Irving Watkinson, St. Bernards.

MARCEL A. VITI, Hon. Sec.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1902, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, $50.00.
Second prize, $30.00.
Third prize, $20.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1902.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. An outline chart suitable for reproduction, showing the course taken, must accompany each article. When possible, articles should be accompanied by amateur photographs taken on the cruise, including one of the boat. Good photographs will be considered in making the awards.

5. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York city, on or before Nov. 15, 1902.

Mr. T. C. Zerega has very kindly consented to act as judge and to make the awards.

New York Y. C.

THE fifth general meeting of the New York Y. C. was held on Thursday evening, Oct. 23, at the club house on West Forty-fourth street. The meeting was of unusual importance, as the question of a new measurement rule was to be discussed, and for that reason was well attended by yacht owners. The regular business of the meeting was first disposed of, and this occupied about an hour. The committee to nominate officers for the coming year was appointed, and is as follows: Lewis Cass Ledyard, E. M. Brown, E. D. Morgan, S. L. Husted, Jr., C. Oliver Iselin, E. M. Padelford, F. M. Hoyt, Charles T. Minton, W. L. Bull and J. Searle Barclay. As Commodore Ledyard is to serve on this committee, it is evident that he is not to continue in office another year. The following were elected members: Lieut. W. L. Littlefield, U. S. N.; Ensign Edward T. Constien, U. S. N.; Capt. R. Morgan Gilson, U. S. M. C.; Capt. David D. Porter, U. S. M. C.; Lieut. Louis McC. Little, U. S. M. C.; Lieut. F. Lewis Sawyer, U. S. N.; Walter R. Herrick, Frank L. Palmer, Lieut.-Com. W. F. Fullam, U. S. N.; Paymaster E. W. Bonnaffon, U. S. N.; Hugh J. Chisholm, Urban H. Broughton, Henry H. Rogers, Jr., De Grande C. Cramer, Lieut. E. W. McIntyre, U. S. N.; A. J. Drexel Paul, Lieut. Noble E. Irwin, U. S. N.; Lieut. W. W. Buchanan, U. S. N.; August Belmont, Jr., C. H. Mathiessen, Paymaster J. A. Mudd, U. S. N.; Surgeon George Rothganger, U. S. N.; William Carpender, Stephen H. P. Pell, Albert H. Atha, Paymaster J. R. Sanford, U. S. N.; Lieut. L. S. Van Duyer, U. S. N.; James Deering, Lieut.-Commander A. E. Culver, U. S. N.; Elbert M. Gary, Norman A. Ream, Capt. Dion Williams, U. S. M. C.; Arthur F. Luke, Lieut. L. H. Chandler, U. S. N.; Lieut. Charles L. Hussey, U. S. N.; William A. Hart, Frederick S. Farwell, Charles D. Mower, Col. J. A. Johnston, U. S. A.; Alexander Greig, Naval Constructor Henry Williams, U. S. N., and Benjamin R. Curtis.

The German Emperor and Prince Henry of Prussia received a unanimous vote as honorary members. They must be voted upon at another meeting under the constitution to become legally elected.

Mention was made by Sec'y Cormack of the syndicate that is to build another boat for the defense of the Cup, but nothing definite was given out. The several committees reported progress.

The report of the Committee on Measurement was read by the chairman, S. Nicholson Kane. All the men present, with the exception of John Hyslop, H. W. Coates and Anson Phelps Stokes, were in favor of the adoption of the rule. Mr. Hyslop spoke at length against the rule, and Mr. Coates wished to table the rule for the time being. When it came to a vote, however, with one or two exceptions, all voted in favor of adoption. The meeting adjourned to meet on Thursday, Oct. 30.

New Life-Saving Boat in Norway.

CAPTAIN DOENVIG, of Horten, Norway, has lately made a trial of a newly invented lifeboat, the result of which seems very satisfactory. The trial was made in presence of representatives of the press, the navy, and the merchant marine. Experts claim for the new invention that it will safely carry its load of human beings through any storm. Below I give a short description of this boat, which may prove of importance to seafaring people all over the world.

The apparatus, or buoy, is round as a globe, only a little flattened at the bottom. It is made from solid sheet iron of the following thicknesses: At the bottom five-sixteenths of an inch, on the sides three-sixteenths of an inch, and at the top one-eighth of an inch. The diameter of the buoy is 8ft.; the height 6½ft. The buoy has a double bottom and draws 2½ft. of water when loaded. The inside of the buoy is entered through three water-tight trapdoors.

Under the deck, which is located about 1ft. below the waterline, are placed four galvanized tanks, with capacity for holding about 140 gallons of fresh water. Alongside the wall runs a low bench to sit on, and the space underneath it is to be filled with canned goods. In the center of the inner room is a funnel that can be shoved up, thus letting fresh air into the buoy. In the top are three small windows, partly for the purpose of letting in light, but also for use in sending up rockets. The buoy is provided with a movable keel which can be let down from the inside; also with a rudder which can be applied in the same manner. Assisted by small oars, which are kept inside, the buoy can be propelled to land in fair weather. On the outside of the buoy is a cork belt, on which the men may stand and row. Further, the buoy is supplied with an anchor and 100 feet of steel rope and with sails, the air funnel serving as mast.

There is no danger that this lifeboat will get dashed to pieces when departing from the sinking ship, as it may simply remain on board until the ship sinks, and it will then float up. The cost of the buoy will be about $500, its weight about two tons, or practically the same as that of a large lifeboat, and it will have accommodations for twenty persons. It is also claimed that this new lifeboat will require far less deck space on board ship than the ordinary lifeboats.

Some years ago the inventor, Captain Doenvig, was in a shipwreck on the coast of Virginia, which bereft him of his family, and ever since he has been deeply interested in the construction of a lifeboat which may be serviceable under all circumstances.

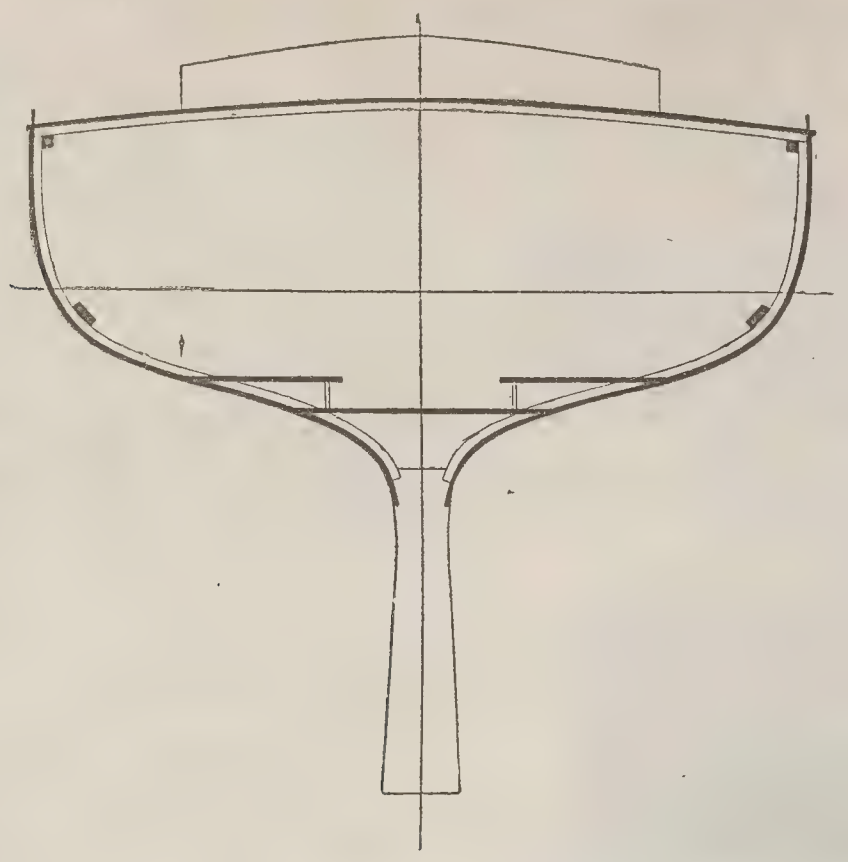
HENRY BORDEWICK, Consul-General.

CHRISTIANIA, Sept 18.

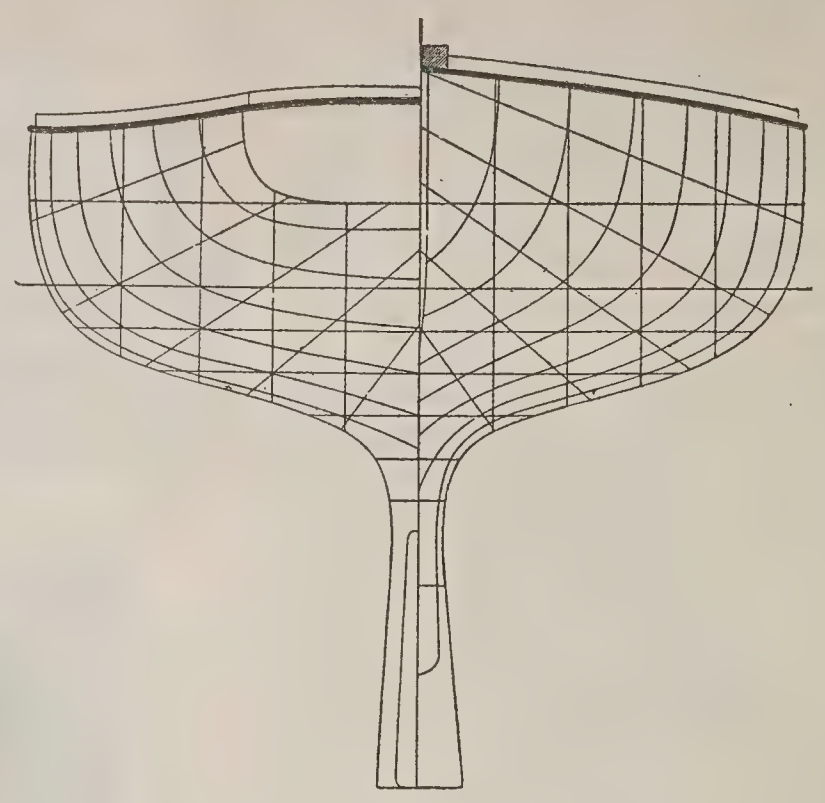
YACHT CLUB NOTES.

A new club to be known as the Pioneer Y. C., of Anglesea, N. J., was incorporated in Camden, N. J., on Oct. 13, by Joseph J. Ley, Albert Anderson, Charles S. Gilligan, Allen M. Torrey, Joseph K. Pelly, George E. Peberdy, Andrew J. Larkin, Robert A. Kendall and Charles F. Honold.

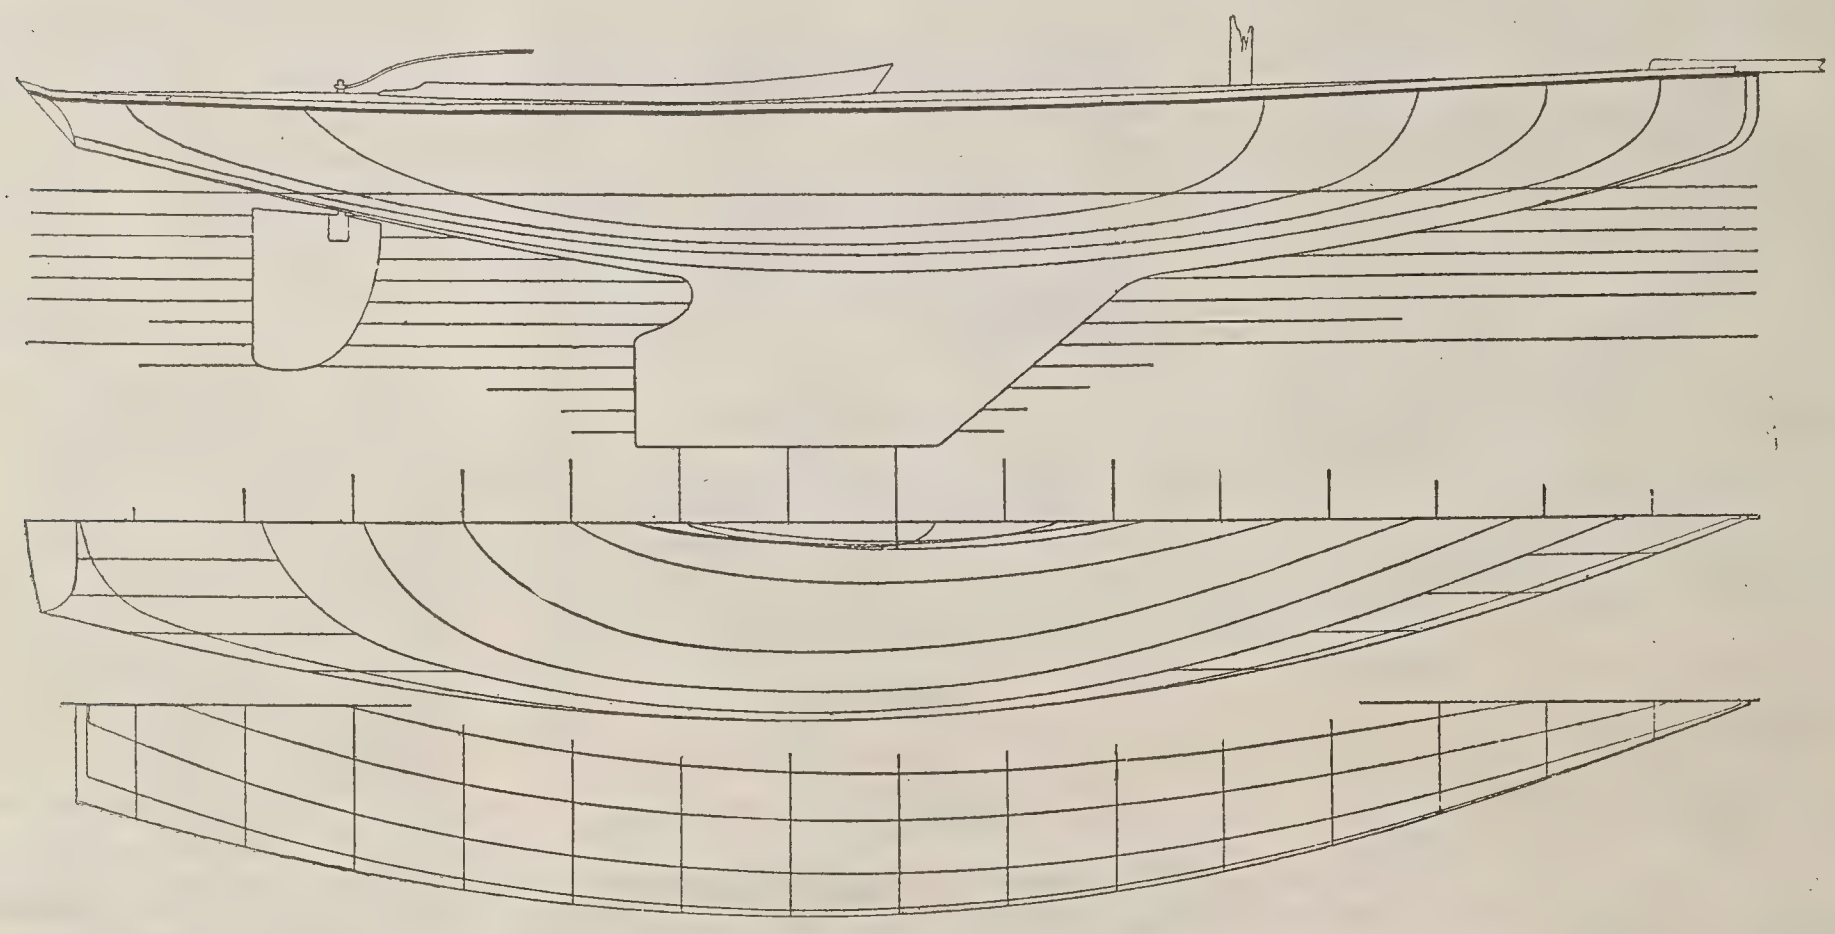
On Sunday, Oct. 19, the sloop Yankee, of the Stuyvesant Y. C., defeated Florence, of the Morrisania Y. C., in a match race for $50 a side over a twenty-mile course by 7m. 40s. There was a full sail breeze from the southwest. This is the last of a series of contests between the two clubs which have been uniformly decided in favor of the Stuyvesant yachts. A friendly match between Zetes and Eleanor, both of the Stuyvesant Club, was settled at the same time, the Zetes winning by 18m. The Stuyvesant Y. C. went out of commission on Saturday, Oct. 25, at 5 P. M., and the members celebrated the event in the evening by a reception, preceded by an entertainment.



SWANHILD II.—MIDSHIP SECTION.
Designed and built by the Herreshoff Mfg. Co., 1899.



SWANHILD II.—BODY PLAN.
Designed and built by the Herreshoff Mfg. Co., 1899.



SWANHILD II.—DESIGNED AND BUILT BY THE HERRESHOFF MFG. CO., 1899.

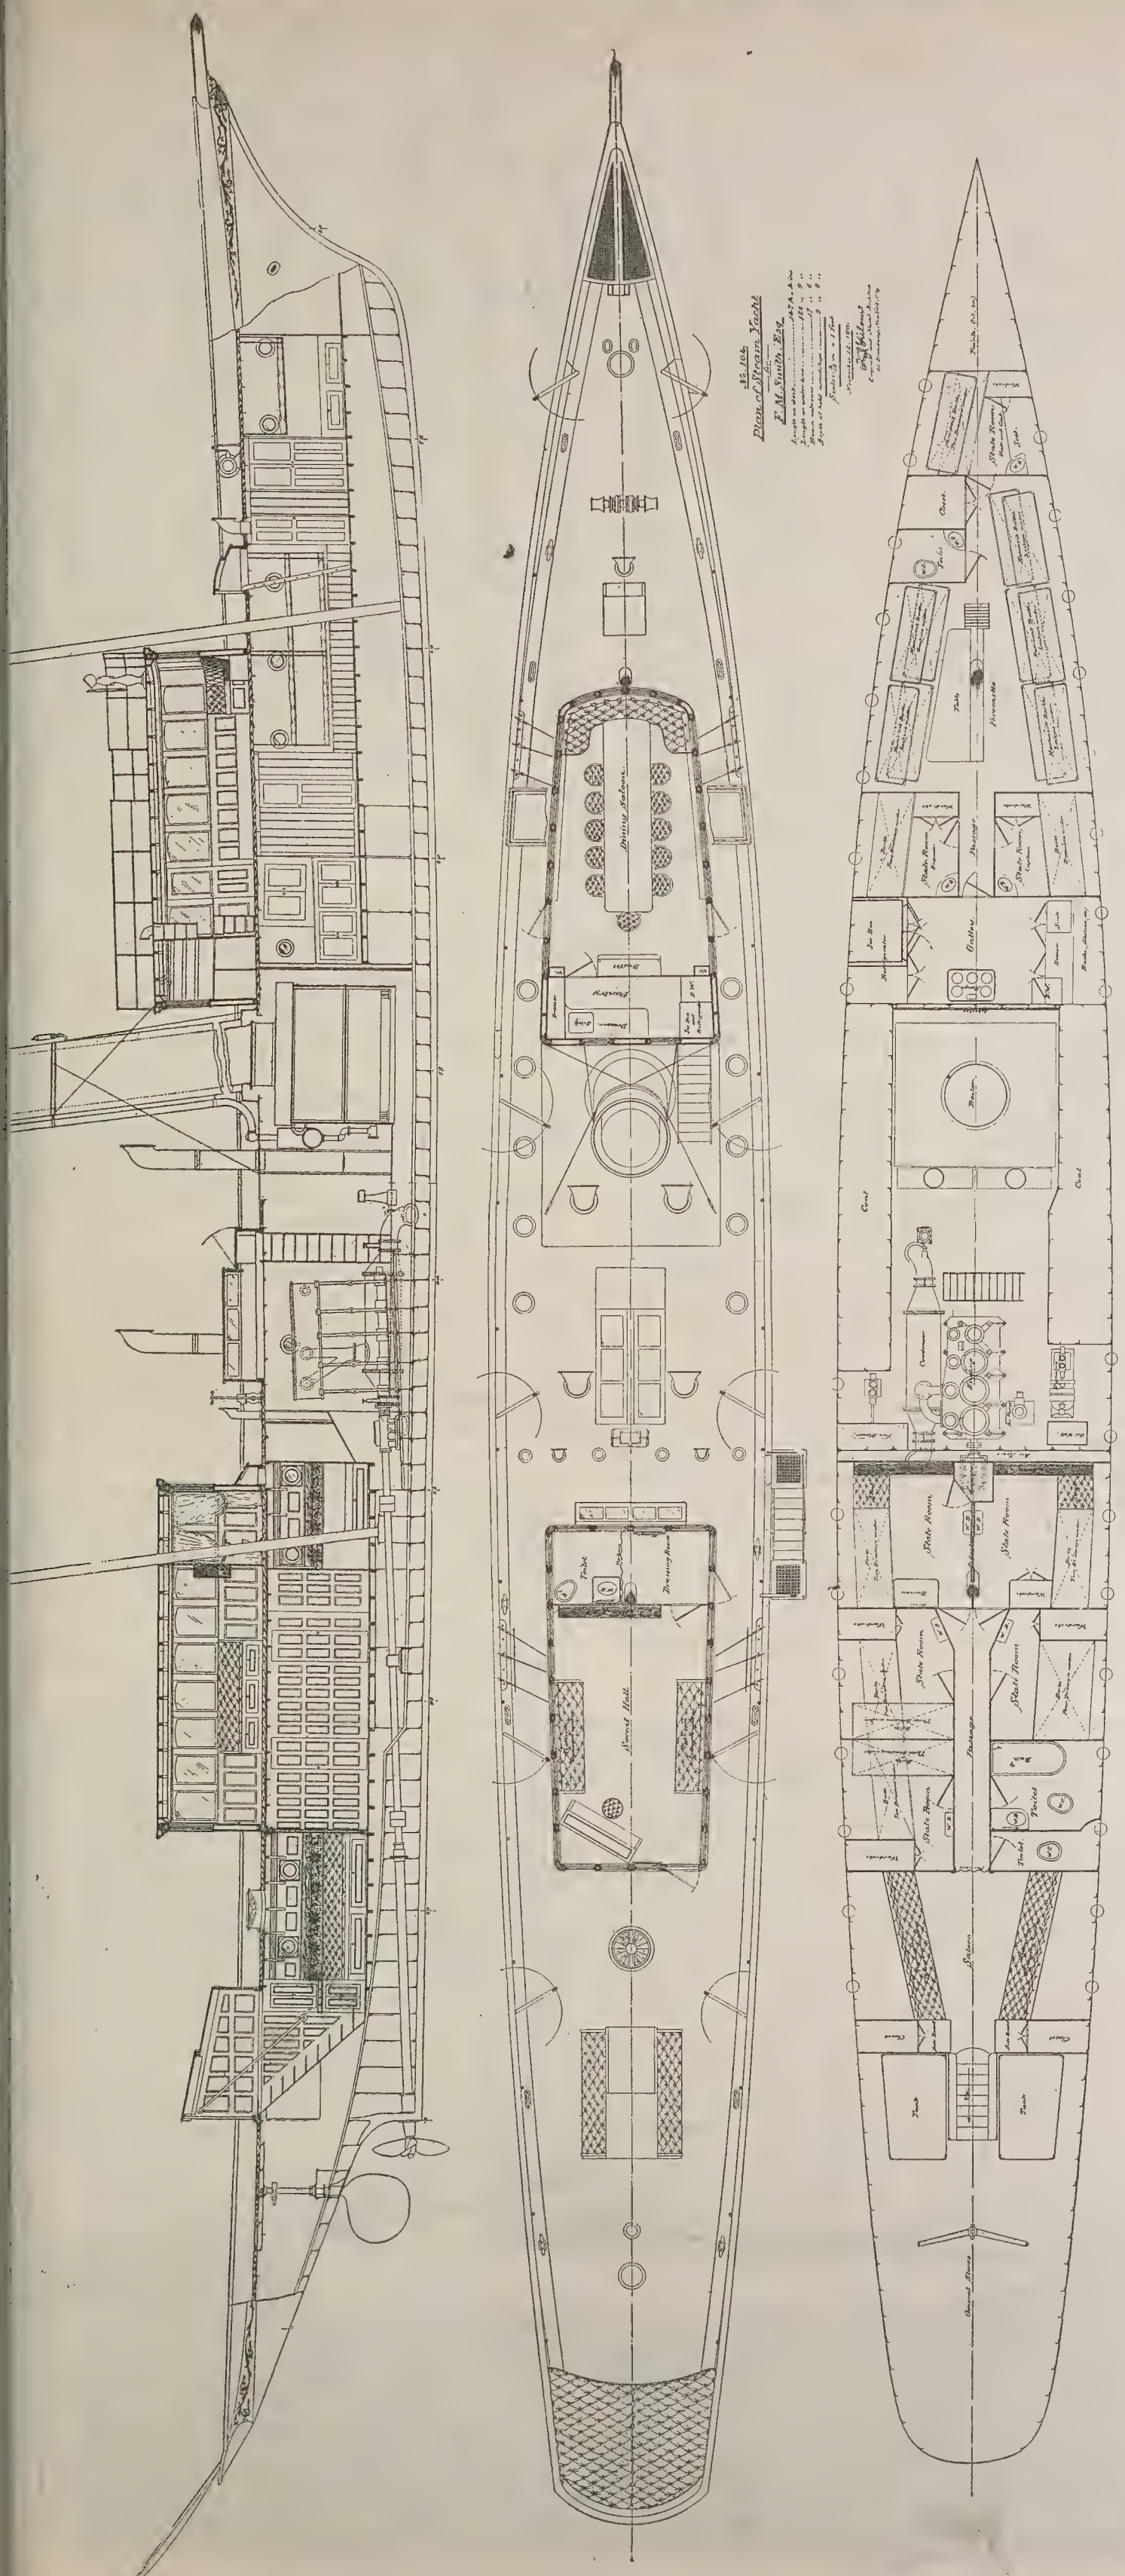
Swanhild II.

THE design of Swanhild II., which is published in this issue, was reproduced from Ny Tidning För Idrott. Very few of the designs of Herreshoff productions are published, and as these lines were taken off carefuliy and accurately on the other side, they are sure to be studied with interest. The dimensions are as follows:

Length—	
Over all	34ft. 1in.
L.W.L.	27ft. 5in.
Breadth—	
Extreme	7ft. 11in.
L.W.L.	7ft. 4in.
Draft—	
Extreme	4ft. 11in.

Sooner than expected, the owner, Mr. C. E. Bichel, had the yacht measured, and published with drawings of Wasp, in the year book of the Kaiserlicher Y. C. In the year book Mr. Bichel makes deductions from the showing made by Swanhild II., and the following particulars relating to her construction are given: "On account of the great results attained by Herreshoff, the master of yacht building, I thought of getting one of these famous boats, thereby obtaining an original model. The new rule of measurement had also something to do with my deciding on this move. With the assistance of a well-known Hamburg correspondent, the yacht was ordered in January, 1899, and delivered in New York in April of the same year, where she was shipped and sent on her long voyage to Europe, arriving without a scratch. As far as the exterior is concerned, the yacht presented itself in a brilliancy of color very pleasing to the eye. The brown mahogany showed itself in splendid contrast to the natural light-colored cockpit and railing, and the light green deck, a light gray bottom and snow-white sails. The usually even bow line which rules the form of yachts has been replaced by a straight one which ends just above the waterline and is connected with the keel running down to the lead. The form of Swanhild II. resembles very much other yachts built by Mr. Herreshoff, for instance, Jilt, Sintram and Typhoon. The yacht carries mainsail and jib on a short jib boom; all the halliards and sheets lead into the roomy cockpit, where there is ample room for handling them. Her sails are made of a special kind of canvas or duck, which is very light in weight and closely woven. The mast, boom and gaff seems to us more like sticks than spars, and rigging for stays, shrouds and blockets, etc., is of very light construction, pains having clearly been taken to save weight wherever possible. I had not given any particular order except asking for a good sea boat. Mr. Herreshoff delivered a yacht which, to use his own words, is non-sinkable, and practically non-

SWANHILD II.—SAIL PLAN.
Designed and built by the Herreshoff Mfg. Co., 1899.



HAUOLI.—DESIGNED BY HENRY J. GIELOW FOR F. M. SMITH, 1902.

capsizable, the former on account of watertight compartments fore and aft, and the latter on the general construction of the yacht."

Hauoli.

IN this issue appears the cabin plans and a photograph of the steam yacht designed by Mr. Henry J. Gielow and built by the John N. Robins Co., Erie Basin, South Brooklyn, this year for Mr. F. M. Smith, owner of the successful 43-footer Effort. The yacht was remarked last summer wherever she went for her handsome appearance and for the clean way she left the water when running at high speed. Her prinicpal dimensions follow:

Length—	
Over all	153ft. 7in.
L.W.L.	122ft. 9in.
Breadth—	
Extreme	17ft. 6in.
Depth—	
Amidships	9ft. 8in.
Draft	6ft. 9in.

Hauoli was built in the best possible manner under Mr. Gielow's direct supervision, and as a result only the best material was used in the yacht's construction. Hauoli has four watertight bulkheads and a double bottom, which can be used for fresh water tanks or for water ballast.

The two deck houses are of mahogany and are each 22ft. long. In the forward house is the dining saloon and pantry. Fourteen persons can be accommodated at table in the dining saloon. The butler's pantry is fitted with refrigerator, sink, dressers, racks and dumb waiter connecting with the galley, which is just below. The after deck house is used as a sort of general living room. Here is a piano, wide sofas on either side, and on the forward partition there is a folding berth. In the forward end of the deck house there is a dressing room and a lavatory.

The machinery space and boiler room is amidships, separated from the rest of the vessel by steel bulkheads. In order to deaden sound and reduce the heat, a wide air space is fitted at the after end with several asbestos bulkheads and smaller air spaces between, all arranged with ventilator hoods on deck in order to produce a satisfactory circulation of air.

Aft of the engine space are two large staterooms, one for the owner and one for his wife. These rooms are fitted up in a most complete and comfortable manner. On the starboard side aft is another stateroom of good size, and aft of this is a bathroom and a toilet room. On the port side opposite are two roomy staterooms. The main saloon is aft and is 12ft. long, wide transoms extend along each side, while aft on either hand are closets and sideboards. A wide companionway leads to the deck. On each side of the companionway are fresh-water tanks.

Forward of the engine space is the galley, which is quite roomy and extends the full width of the vessel. On the port side is a large refrigerator and cold closet, and on the starboard side are the racks, sink, dresser and dumb waiter. A large stove is placed against the steel bulkhead aft. Forward of the galley are two staterooms, one on each side of the passage, the one to starboard for the captain, and the one to port for the engineer. Forward of these rooms is the forecastle, which is roomy, and there is ample accommodation for the ten men who live there. On the port side of the forecastle forward is a toilet room and a big closet. Forward of this is a stateroom with two bunks for the stewards. In the eyes of the boat there is storage space for paints, oils, etc.

All the interior woodwork is enamel white with mahogany doors and trim, giving a very light, neat and substantial finish.

All the plumbing is of the most approved kind, and arrangements were made for hot, cold, fresh and salt baths. The yacht is lighted throughout by electricity, and in addition there is a searchlight and fans. A storage battery insures light at all times.

The engine is of the four-cylinder triple expansion type, and it was designed by Mr. Gielow. There are two boilers of the water tube pattern.

On a six-hour test Hauoli averaged over eighteen miles, and under forced draft she has made over twenty miles.

Report of Committee on Measurement of the New York Y. C.

WE publish herewith the report of the Committee on Measurement. The committee was appointed by Com. Ledyard at the first general meeting, held Feb. 13, 1902, and was made up of the following gentlemen: S. Nicholson Kane (chairman), C. Oliver Iselin, W. Butler Duncan, Jr., A. Cass Canfield, Henry F. Lippitt, John F. Lovejoy, Oliver E. Cromwell, Newbury D. Lawton, Archibald Rogers, E. D. Morgan and George A. Cormack (secretary). The first meeting of the committee was held on Feb. 27, 1902, and from that time until the last Thursday night, Oct. 23, when the report was adopted by the club members, these gentlemen have devoted much time and labor to the question.

From the time the committee first met and it was decided to consult the most prominent designers and mathematicians in the United States, England, Canada, Australia, France, Germany, Denmark, Norway and Sweden, they have kept constantly in touch with them, and as the work progressed and developed, they were notified. In almost every instance the men consulted by the committee gave all the assistance within their power. Remarkable as it may seem, nearly all the designers were in accord as to what a rating rule should be, and without exception they all advocated displacement as a factor in the formula. Nearly all recommended that the three factors of the formula should be length, sail area and displacement. It was then the committee's work to put these factors into a formula that was mathematically correct.

The present rule is a designer's rule pure and simple, and when it is seen that it is the result of the experience, both theoretical and practical, of such able men as Nathaniel G. Herreshoff, Bristol, R. I.; A. Cary Smith, New York, N. Y.; William Gardner, New York, N. Y.;

B. B. Crowninshield, Boston, Mass.; Clinton H. Crane, New York, N. Y.; George L. Watson, Glasgow, Scotland; William Fife, Glasgow, Scotland; Arthur E. Payne, Southampton, England; Arthur Milne, Glasgow, Scotland; Linton Hope, London, England; J. N. Soper, London, England; R. E. Froude, Gosport, England; J. T. Bucknall, Bitterne, England; Alfred Benzon, Copenhagen, Denmark, and Charles H. Duggan, Montreal, Canada, few thinking men will array themselves against such a formidable list. The men who made up the committee, are all men of prominence who have devoted their lives to the development of yachting—men of great practical experience, fully qualified to pass upon the needs of the sport.

The report of the Committee on Measurement follows:

Rating Measurement.

$$\text{Rating Measurement} = \frac{L\sqrt{SA}}{5\sqrt[3]{D}}$$

Length multiplied by square root of sail area, divided by 5 times cube root of displacement.

LENGTH.

L.—Length to be obtained as follows:

To extreme beam (B), wherever found, add greatest beam at load waterline (b), and divide by eight $\left(\frac{B+b}{8}\right)$; lay off line parallel to and this distance from middle line of hull on deck and take extreme length of hull measured on this line; to this add length of load waterline on vertical projection of this line to waterline plane and divide the sum of these lengths so obtained by two, which will give L in the formula.

SAIL AREA.

S. A.—Sail area to be obtained as follows and the square root of this area to be the $\sqrt{S\ A}$ in formula:

MAINSAIL.

A. Measured from the top of the boom (under the pin for outhaul shackle on traveler, or clew slide, when hauled chock out) to the gaff under the pin of the sheave of the topsail sheet, provided the peak cringle of the mainsail does not extend beyond the pin: in the case of the yacht having no topsail, or of the peak cringle extending beyond the pin of the topsail sheet sheave, then the measurement to be taken to the peak lacing hole.

B. Perpendicular to A, measured to underside of gaff close in to the mast.

C. Measured from top of boom over the pin of the sheave or outhaul or end of clew slide to underside of gaff close in to the mast.

D. Perpendicular to C, measured in to the mast, in a line with the top of the boom, or to tack cringle of mainsail, if below top of boom.

YARD TOPSAIL.

E. Measured from upper side of gaff close in to the mast to pin of sheave for topsail sheet, or to lacing-hole in jackyard.

F. Perpendicular to E, measured to lacing-hole in yard.

G. From lacing-hole to lacing-hole in yard.

H. Perpendicular to G, measured to pin of sheave for topsail sheet in gaff; or to lacing-hole in jackyard.

JIB HEADER.

K. Measured from top of gaff close in to mast to pin of halyard sheave in topmast.

L. Perpendicular to K, measured to pin of topsail sheet sheave in gaff; or to lacing hole in jackyard.

LUGSAIL.

To be measured as mainsail, except as follows:

A. Upper end measured to peak lacing-hole in yard.

B. and C. Forward end measured to lower lacing-hole in yard.

D. Lower end measured to tack cringle of mainsail, if below top of boom, or forward of mast.

HEADSAILS.

I. The perpendicular I to be measured from the deck at the foreside of the mast to where the line of the luff of the foremost headsail, or of the spinnaker halyard, as the case may be, when extended, cuts such perpendicular. In the case of a schooner the perpendicular I shall be measured upon the foremast, unless she has a main spinnaker the height of which exceeds the perpendicular upon the foremast, in which case the excess shall be added to the perpendicular I.

J. The base J to be measured from the foreside of the mast to where the line of the luff of the foremost headsail when extended cuts the bowsprit, other spar, hull, etc., as the case may be. In all cases, if the distance from the center fore and aft line of the mast to the outer end of the spinnaker boom exceeds the distance from the foreside of the mast to the bowsprit end (where cut by the line of the luff of the foremost headsail), the excess shall be added to the base of the fore triangle. In the case of a schooner, the base J shall be measured from the foremast, but if the main or longest spinnaker boom exceeds the before mentioned distance, the excess shall be added to the base J.

In the case of a yacht having no headsail, but carrying a spinnaker, the area for headsail shall be computed from the length of spinnaker boom, and the height from deck to where the line of the halyard of the spinnaker when extended cuts the mast.

A spinnaker may have a headstick or board not longer than one-twentieth the length of the spinnaker boom, but not a foot yard, or more than one sheet, or any other contrivance for extending the sail to other than a triangular shape.

In the case of a yacht carrying a square sail, or square topsail, or raffee (together or separately), the actual area of the same shall be computed; and if such area exceed the area of the fore triangle, the excess shall be used in the total area for determining the rating.

FORESAIL OF SCHOONERS.

To be measured as mainsail, except that the lower end of A is to be taken at foreside of mainmast, in a line with main boom gooseneck.

Directions for Measuring Sails.

The measurer shall take measurements I and J for fore-triangle, G and E for yard topsail, and the length of spinnaker boom. If the other measurements are supplied by the sailmaker, the measurer shall check them by measuring the following:

Boom, from lower end of A to lower end of D.

Gaff, or lugyard, from upper end of A to forward end of B.

Jackyard topsail, sheet to outer lacing-hole.

In cases where it is necessary for the official measurer to measure the sails, he shall do so in the following manner: Take the length of boom from mast to pin of sheave for outhaul, and length of gaff from mast to pin of topsail sheet sheave or lacing-hole as the case may require; then hoist the sail with the tack fast and set the peak and luff up taut, and let go the topping lifts so that the weight of the boom comes on the leach of the sail. With a line and tape, measure the leach and luff and the diagonal C. For the headsail measure the height I, and the distance J, as provided for in the section dealing with headsail. For topsail the sail should be hoisted and marked in a line with the gaff; then lowered and the other dimensions taken. From the measurements so taken a sail plan should be made and the other above-specified measurements obtained therefrom.

Calculation of Sail Areas.

MAINSAIL.

Multiply A by B and C by D, and add the two products together and divide by 2.

YARD TOPSAIL.

Multiply E by F and G by H, and add the two products together and divide by 2.

JIB HEADER.

Multiply K by L and divide by 2.

HEADSAILS.

Multiply I by J and divide by 2.

LUGSAILS AND HEADSAILS.

No deduction is to be made from headsail area on the score of any portion of the lugsail area ahead of the mast.

SAILS BOUNDED BY CURVED EDGES.

Any increase in the area of sails due to curved edges, extended by battens or otherwise beyond the line between the points for measurement, shall be computed as follows: Multiply the base E by two-thirds of the perpendicular P.

DISPLACEMENT.

D.—Displacement to be obtained as follows:

At points dividing the length of the load waterline into five equal parts, find areas of immersed cross-sections in square feet; from the areas in square feet obtained and load waterline length, find approximate displacement in cubic feet, which will be the D in formula.

Limit L. W. L.

Should the L.W.L. of any yacht in racing trim exceed

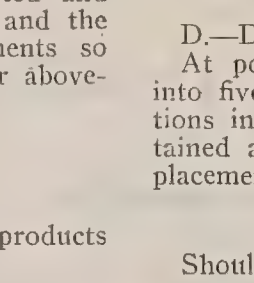
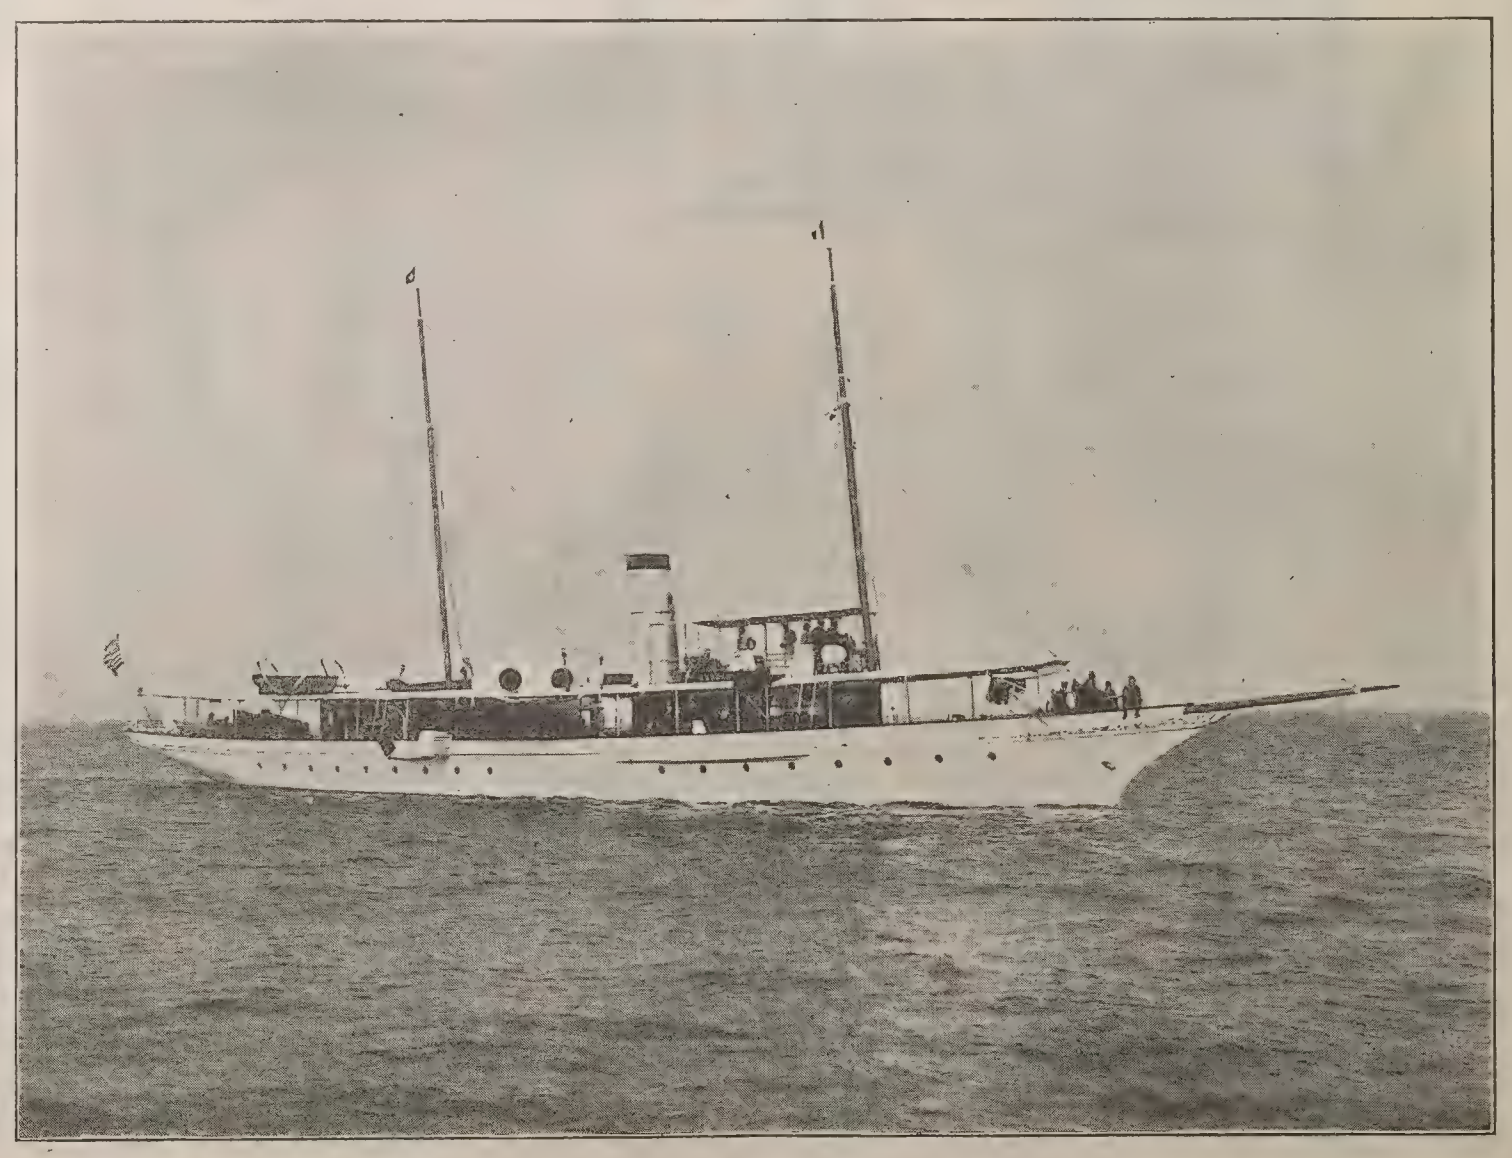
CLASSIFICATION.

4:5 principal. Each limit four-fifths of limit of class above, approximately, with regularly increasing intervals.



The figures in the above tables are approximate measurements furnished by designers.



HAUOLI.
Designed by Henry J. Gielow for F. M. Smith, 1902.

L by more than ten per cent., such excess of L.W.L. shall be added to her rating.

Limit of Draft.

The limit of draft for all vessels shall be 18ft.

Should the extreme draft of any yacht in racing trim exceed the limit of draft specified for her rating, such excess of draft shall be multiplied by five and be added to her rating.

Limit of Sail Area.

Should the square root of the sail area of any yacht exceed her measurement of L by the foregoing formula more than thirty-five per cent., any such excess shall be added to her measurement.

All measurements specified may be certified to by the designer, in a certificate to be filed with the measurer of the club, but such certificate must be accompanied with drawings, showing the measurements taken and the true line of flotation of the vessel when measured in racing trim, which line of flotation must be verified by the measurer, before any certificate of measurement shall be accepted by the secretary.

If from any peculiarity in the build of a yacht, or other cause, the measurer shall be of opinion that the rule will not rate the yacht fairly, or that in any respect she does not comply with the requirements of these rules, he shall report the circumstances to the Regatta Committee, who, with the measurer, after due inquiry, shall award such a certificate of rating as they may consider equitable, and the measurement shall be deemed incomplete until this has been done.

In connection with the proposed rule, the committee recommends the following classification:

Classification.

SCHOONERS.

Class A. Over 100ft., rating measurement.
Class B. Not over 100ft. and over 80ft., rating measurement.
Class C. Not over 80ft. and over 64ft., rating measurement.
Class D. Not over 64ft. and over 51ft., rating measurement.
Class E. Not over 51ft., rating measurement.

SLOOPS.

Class F. Over 100ft., rating measurement.
Class G. Not over 100ft. and over 80ft., rating measurement.
Class H. Not over 80ft. and over 64ft., rating measurement.
Class I. Not over 64ft. and over 51ft., rating measurement.
Class J. Not over 51ft. and over 40ft., rating measurement.
Class K. Not over 40ft., rating measurement.

In connection with the proposed rule and classification, the committee further recommends that the formula for time allowance shall read

$$\text{Time} = .8\left(\frac{3,600}{\sqrt{\text{I}}} - \frac{3,600}{\sqrt{\text{L}}}\right);$$

3,600 representing the number of seconds in an hour, I the rating measurement of the small yacht, and L the rating measurement of the large one.

It was considered desirable by many that the full theoretical value of time allowance (one hundred per cent.) be allowed, but the committee, wishing to be conservative, recommends that the tables now in use be raised from sixty to eighty per cent., as in the above formula, and that all vessels shall receive time allowance according to their rating in all races, except when otherwise specially provided.

The committee believes that the present conditions under which the larger boat has the advantage in her class should not obtain to such an extent as it has heretofore, and that those wishing to build should have greater latitude in the choice of size within the limitations of their respective classes, so that a smaller boat may be nearer equality with the vessel of the highest rating in her class.

In order that the members of the club may be familiar with the workings of the proposed rule and how it may affect existing boats, tables from figures furnished by several prominent American designers, giving the measurements of numerous boats, both under the old rule and the new, have been made and are annexed to his report.

In the opinion of the committee, the adoption by the club of the above recommendations will greatly increase the interest in yachting, promote the building of a better type of vessel, and place racing on a firmer and more equitable basis. The committee therefore consider it advisable that the club should adopt these recommendations for a period of five years.

Correspondence.

Editor Forest and Stream:

The troubles of the Y. R. A. of Massachusetts are to be deplored, although a perfectly natural consequence of their short-sightedness. Your correspondent says, "It has developed that the wide, flat-floored centerboard boat, or even a wide keel boat with immense overhangs, has a distinct advantage over narrower boats with more displacement and less sail area." And he says that Mr. Adams suggested a reduction of sail area and an increase of ballast (I suppose displacement is really meant). These suggestions are the key to the solution if one important factor is not overlooked and that is that the flat floor and "immense overhang" gives a long, narrow body to sail on when heeled, it is therefore futile to reduce sail and add ballast alone. An absolute limit must be put on the inclined length to accomplish anything, and it must be done directly and not by any midship section limitation for the reason that such a limitation, if it gives any liberty of form, can easily be evaded.

In the restricted classes fix a minimum for displacement, a maximum for sail area, draft and inclined load waterline length, and the percentage of ballast to displacement, and the result will be a type of yacht as fast and as seaworthy as can be obtained where these two antagonistic conditions are set up.

GEO. HILL.

NEW YORK, Oct. 22.

The Barnegat Sneak Box.

Editor Forest and Stream:

A great deal has been said about the sneak box, but the more we see of them the more we find can be said of them. These boats have been known in these waters for upward of fifty years. As near as we can learn, Sammy Perrine was the originator and was for many years the leading one to build boats of that class. Each year saw a marked improvement, until to-day there are few if any boats in our American waters that can excel them for comfort, safety and speed. When properly handled there is nothing that can compare with them in heavy weather, as they are nearly all decked over, making them able to stand the sea without danger of filling. They are generally of greater breadth of beam than any other boat of the same length, thus enabling them to carry a greater spread of canvas. When first originated they were very different from the sneak box of to-day. They were alike on top and bottom, the only difference being a hole cut in one side, which was called the top. Then they were used chiefly for gunning, and derived their name from being adapted for sneaking up on a flock of ducks. They were used very little for sailing then, as they were very likely to take a header and not come up, the box being much lower than any other part of the boat. To-day we have them exclusively for speed, they being 18 to 20 feet long, with an enormous spread of sail. Our bay here during the summer is the scene of some hotly contested races between this class of boats, having almost entirely taken the place of yacht racing, as all interest seems centered on this one style of craft. We have seen some very handsome boats turned out of the yard of A. F. Kilpatrick, who is the leading builder of these boats at the present day. His boats may be found in all parts of the United States, he having sent one to California last winter. In our travels in different watering places we have failed to find any boat that would compare with this class for an all-round work or pleasure craft. They are very commodious and draw very little water, enabling them to go over shoals and flat places where other boats of same proportions would be compelled to go many miles, oftentimes to follow the channel. For a one-man boat a sneak box of about 14 feet is most suitable, as in light weather one can row very nicely, and should the wind breeze up quite fresh, they are capable of weathering it with the boats of much larger class. Our experience with different style boats has proved beyond a doubt that for a man of limited means they are the largest, cheapest and handiest boat one can find anywhere on our Atlantic coast.

For gunning for ducks in winter, they are without an equal, as they are very light (not being over 12 feet long for gunning purposes), one can easily haul them out on the meadows and make a good hide, while at the same time they are covered over so one has protection from the winds. Sportsmen from all parts of the country say they are far ahead of anything they ever saw for comfort in cold weather while lying out watching for ducks. Many of our readers already know much about these boats, having been around Barnegat Bay, where they are the leading style, and we have often heard them say that for comfort and an all-round handy boat, there is none to excel the famous Barnegat sneak box.

R. G. COLLINS.

BARNEGAT, N. J.

Manchester Y. C. Challenge Accepted by the Royal St. Lawrence Y. C.

A special meeting of the Royal St. Lawrence Y. C. was held in Montreal on Monday, Oct. 20, to select the club whose challenge should be accepted for the Seawanhaka Cup. The executive committee of the club favored the acceptance of the challenge of the White Bear Y. C., of Minneapolis, but it was finally decided to accept the Manchester Y. C.'s challenge, and it was carried by a vote of 19 to 17.

The Manchester Y. C. will pursue a different policy than did the Bridgeport Y. C. last summer. Outside clubs will not be asked to participate in trial races, but there will be one or more boats built for and owned and sailed by Manchester Y. C. members. This is a good idea and will make the matter purely a Manchester Y. C. affair. This will avoid any of the unpleasantness that existed this year.

Mr. W. Starling Burgess has received an order for a boat. She is sure to be well handled for she is to be sailed by Mr. Reginald Boardman. Mr. A. Henry Higginson will look after the light sails and Mr. Frank Burgess will take care of main sheet. All these men sailed on Outlook this year, and are rated among the cleverest amateurs in the East.

It would not be surprising if Mr. Frank Crowninshield had a trial boat built. Several other boats are talked of, but the Burgess boat is the only one that has actually been ordered.

A New Book on Yachting.

"YACHTING" is the title of a new book recently written by Julius Gabe, an English author on the sport. The book is made up of a number of historical sketches of yachting incidents and of clubs. The author has gathered together considerable matter of historical value, and he has traced the sport back to the day of the Romans.

Interesting and valuable histories of all the principal British clubs are given, and the writer also gives an outline of the development of the New York Y. C., and devotes a chapter to the races for the America's Cup. Mr. Gabe, like many English writers on yachting, exploits the pet British theory that had it not been for the unfair conditions in the Deed of Gift that made it impossible for the challenging yacht to sail on even terms with the defending yacht that the America's Cup would be in England to-day.

Yacht racing in British waters of recent years is well covered, and there is much data given, such as the courses, names and owners of competing yachts, etc. Two chapters are devoted to the French and German clubs. The book, which is dedicated to Sir Thomas Lipton, is well bound in blue cloth and contains 266 pages of matter and some forty full-page plates of prominent English yachts, both sail and steam. The book is really well gotten up, and is most readable.

Rifle Range and Gallery.

Ossining Gun Club.

OSSINING, N. Y., Oct. 27.—The following scores were made at the rifle gallery of the Ossining Gun Club; distance, 50ft.; target, ¼in. 25-ring, 10-shot scores: J. Willi, Sr., 193; Wm. H. Coleman 230; Amos Bedell 231, 233; C. G. Blandford 242, 241; E. F. Ball 240; Dr. E. B. Sherwood 234; J. F. Graham 230, 210; Thos. O'Connell 230; Geo. Tompkins 223, 239; H. J. Ludwig 210; G. H. Davis 228; Wm. Green 189, 211; H. Tonolla 220; C. H. Sidman 236, 230; F. Tompkins 230; L. C. Kenyon 230; B. Ganun 230; E. H. Sherwood 229; Miss Frances Gibson 216, 215; Mrs. E. F. Ball 224, 227; Miss Adelaide Willi 80.

In the re-entry prize contests the following are high:

Members: First, D. Brandreth, 233; Amos Bedell, 233; second, W. H. Coleman, 230; third, Dr. E. B. Sherwood, 229.

Non-Members: First, Geo. N. Tompkins, 239; second, C. H. Sidman, 236; third, J. F. Graham, Thos. O'Connell, F. Tompkins, L. C. Kenyon and B. Ganun, each 230.

Ladies: First, Mrs. E. F. Ball, 236; second, Miss Frances Gibson, 216.

Cadets: First, E. H. Sherwood, 229.

E. F. BALL, Compiler of Scores.

The following, taken from the daily press, recounts the results of a trial of bullet-proof cloth as follows: "The so-called bullet-proof vest invented and woven by Rev. Casimir Zeglen, a Polish Catholic priest of St. Stanislaw's Church, Chicago, was penetrated by several bullets from a .38cal. military revolver at a public exhibition at Brooklyn recently. The cloth withstood bullets from all other weapons, including the various calibers from .22 to .44. The velocity of the .38cal. bullet was 825ft. a second, while that of the other bullets ranged from 725 to 775. Father Zeglen, who was detained by the manufacture of twenty vests for some of the coal mine operators, telegraphed that he would wear the vest and give a public exhibition in New York city in about three weeks." Under the circumstances, it would be the part of prudence if Father Zeglen permitted some one, other than himself, to wear the vest when it is shot at.

Trapshooting.

Fixtures.

Oct. 29-30.—Raleigh, N. C.—Two days' shoot of the Raleigh Gun Club; $100 added each day. R. T. Gowan, Sec'y.

Oct. 30-31—Dalton, O.—Annual fall tournament of the Dalton Gun Club. Ernest F. Scott, Captain.

Oct. 30.—Augusta, Ill.—Second target tournament of the Augusta Gun Club. Frank Bacon, Sec'y.

Oct. 30-31.—Dalton, O.—Target tournament of the Dalton Gun Club.

Oct. 30-31.—Hillsboro, Ill.—Target tournament of the Hillsboro Gun Club.

Oct. 31.—Ceres, Pa.—First annual tournament of the Ceres Gun Club. Targets and live birds. L. B. Learne, Sec'y, Ceres, N. Y.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Fourth Tuesday of each month, Hell Gate Gun Club's shoot at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Second Friday of each month (January and July excepted), shoot of Hell Gate Annex, at Dexter Park, Brooklyn.

Saturdays, Brooklyn Gun Club's shoot, Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

Saturdays, Newark, N. J., South Side Gun Club's shoots, South Broad street, near Lehigh Valley coal depot.

Saturdays, Outwater's grounds, Carlstadt, N. J., live bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

Mr. C. Palmer, Mornington House, Farrar Road, Bangor, North Wales, England, writes us in pleasant vein as follows: "It gives me much pleasure to receive the FOREST AND STREAM weekly, and to follow the doings of the various shooters who formed the American bird or target team which competed with such success in the match last year between England and America, and beside winning the match, won the esteem of the English side, of which I was one. The very best feeling prevailed throughout the contest, and we on this side voted the American team to be one and all true sportsmen and a jolly good lot of fellows. I only wish it were possible for us to accept the kind invitation to come across the herring pond, knowing full well the kindly welcome and fair play we should receive."

The programme of the Ceres Gun Club's first annual tournament, to be held at Ceres, Pa., Oct. 31, provides both target and live bird competition. Target handicaps, 14 to 20yds.; live-bird handicaps, 26 to 32yds. Competition open to all. There are twelve target events, 10, 15, 20 and 25 targets, entrance based on 10 cents per target. There are two events at live birds. First and second high averages, $5 and $3. Lowest average, $2. Rose system, ratios 8, 5, 3 and 2 will prevail. Shooting commences at 9 o'clock. Handicap committee: Messrs. J. C. Crandall, Randolph, N. Y.; H. L. Zimmerman, Bolivar, N. Y., and F. F. Mason, Olean, N. Y. For further information address the secretary, A. B. Learne, Ceres, N. Y.

The Newton, N. J., Gun Club have passed a set of resolutions thanking Mrs. F. E. Butler (Annie Oakley) for the trophy, a silver cup, presented by her to that club. Two of the resolutions are as follows: "Resolved, That every member of said club do resolve to attempt to reach the sublime heights of perfection facing the traps as they feel they have achieved when telling about it; and be it further resolved, as a mark of our respect and esteem for the donor of said gift, that she be, and hereby is, elected as an honorary member of the Newton Gun Club."

Mr. T. W. Morfey, the eminent trapshooter, moved from Queens, L. I., to Dover, N. J., on Monday of this week. The latter place is much more convenient for him to reach in his journeyings to and fro in the territory which he covers as a trade representative. He will also engage in the breeding of high-class cattle, fancy fowls and modern agriculture.

On the grounds of the Keystone Shooting League, Philadelphia, Monday of this week, Mr. Fred Coleman, of Higgins, Pa., defeated Mr. Harry S. Coldron, of Reading, Pa., by a score of 99 to 96. The conditions were 30yds. rise, $2.50 a side, loser to pay for the birds, all of which, with the resulting scores, made it a match of the first class.

The University of Pennsylvania trapshooters are preparing, by diligent practice, for their intercollegiate contest with Harvard and Cambridge, on Nov. 8, as a matter of interest contingent to the football game.

At the tournament of Messrs. Klein and Burmeister, Spirit Lake, Ia., Oct. 21 and 22, Mr. W. R. Crosby, shooting from the 22yd. mark, won the cup and first money in a 50-target event on the second day, scoring 46. He averaged 95.1 per cent for the two days. The cup for the amateurs making the highest average was won by Mr. Guy Burnside. It was arranged for a three-day tournament, but owing to the light attendance the third day was cancelled.

Mr. Albert A. Schoverling, corresponding secretary, informs us that the next shoot of the Fulton Gun Club will have prizes for competition, and will commence at 1 o'clock, Nov. 2. To reach the grounds, take, from Brooklyn Bridge, the Kings county elevated to Crescent street, or, from Twenty-third and Forty-second street ferries, take elevated to Crescent street, from which it is about ten minutes' walk to the grounds via Old Mill Road.

Elsewhere in our trap columns Mr. Elmer E. Shaner, manager of the Interstate Association, calls attention to the matter of the Association's tournaments for 1903, and presents a suggestion concerning applications of clubs in that relation. The annual meeting will be held on Dec. 11. Applications for tournaments should be in the manager's hands by Dec. 8. His address is 111 Fourth avenue, Pittsburg.

The final shoot for the October cup of the Crescent Athletic Club took place last Saturday, on the club grounds at Bay Ridge, L. I. Mr. W. W. Marshall made high score, 45, but Dr. J. J. Keyes had made the three best scores, 48, 45 and 47, a total of 140 out of a possible 150, and won it thereby outright. Mr. W. J. McConvilie and Mr. Marshall scored 139, a close second to the winner.

Mr. A. H. Funke, eminent in business affairs as a sporting goods dealer, announces his removal from 98 Duane street to 325 Broadway, New York. The new quarters are more prominently in the gun district, and are attractively fitted and equipped. In them Mr. Funke will be pleased to meet his numerous friends.

Dr. J. W. Meek carried off high honors in the trophy shoot of the Garfield Gun Club, at Chicago, last Saturday. He scored 24 out of a possible 25. J. McDonald won Class B with 22 and Mr. Wilson won Class C with 17. In the cup event Mr. A. Hellman was winner with 22 out of 25 shot at.

The next regular shoot of the Richmond Gun Club will be held at Silver Lake, Staten Island, on Election Day. The traps will be ready for action at 10 o'clock A. M. A silver cup will be the prize in one of the events. Mr. Albert A. Schoverling, of New Brighton, S. I., is the secretary.

There was a group of shooting talent in Philadelphia last week of high eminence, and as is habitual with them, they indulged in some trapshooting, the scene of which was the Florist Gun Club's grounds. They were Messrs. Dupont, Gilbert, Squier, Hirschy and C. North.

The Glaser trophy, for which the members of the North River Gun Club have been contesting diligently for the past year, was won the third time last Saturday on the club grounds at Edgewater, N. J., by Mr. Truax, and it now becomes his personal property.

John S. Wright's live-bird shoot at North Hudson Driving Park, Hoboken, was quite a success. About fifteen shooters participated. The grounds are nicely equipped for live-bird shooting, and the competition is conducted in a manner in every particular up to date.

Mr. Herbert Taylor, of St. Louis, and Mr. H. C. Hirschy, of St. Paul, distinguished as experts in the manufacture, distribution and use of powder in its relation to industry and sport, were visitors in New York last week.

At a meeting held recently the Nishoyne Gun Club, of Orange, N. J., elected officers as follows: President, F. J. Miller; Secretary, R. B. Baldwin; Treasurer, A. Mosler.

BERNARD WATERS.

Coleman—Coldren.

HOLMESBURG JUNCTION, Pa., Oct. 27.—Mr. Fred Coleman, of Higgins, Pa., defeated Mr. Harry S. Coldren, of Reading, by the score of 99 to 96 in a match at 100 live birds, on the grounds of the Keystone Shooting League, this afternoon. The conditions were 30yds. rise, with the usual boundary, $250 a side, and the loser to pay for the birds.

The crowd was a big one, and many prominent followers of the sport were present from Reading and Allentown with a big delegation. Coleman had been out to the grounds on Saturday and scored 24 and 1 dead out of bounds out of 25. This made him the favorite with the money men, and there was plenty of Coleman money in sight with no takers.

Coleman won the toss and elected his opponent to lead off, and the first bird was shot at 2 o'clock. The weather conditions were warm and sultry, with a very light 3 o'clock wind. The birds were a selected lot, and under ordinary conditions would have been fast, while under the existing conditions they were lazy, and not over 25 per cent. were on the wing with the fall of the trap.

Coleman shot a very cool, steady race from start to finish, and it was only by a narrow chance and a few feet that he did not run 100 straight. His one lost bird was a driver in the twelfth round. The bird was hit with both barrels, but could not be brought to earth inside the fence, falling just over the inclosure fence, about 15ft. over the boundary. The other 99 birds he killed with ease, and with one or two exceptions his birds were killed right over the traps.

Coldren killed the first 15, and then had a bad five minutes, drawing two fairly good birds, right drivers, in the sixteenth and seventeenth rounds, and losing both. In the thirty-fourth round he drew a wicked left driver which did not stop until over the wire fence. He did not lose his nerve with this piece of bad luck, but went along and hammered out 23 straight, losing his fifty-eighth, another left driver. This was his last error, and he finished with 42 straight.

It was the opinion of many of the spectators that Coleman was the more lucky man in drawing birds, and the few fast ones that there were fell to Coldren. From the writer's view, the drawing was about even. Coldren was slower and at times a little erratic with the first barrel, thereby allowing his birds to get a start and get hard. Coleman, on the other hand, was very quick in action, and used his first barrel with good effect, and in nearly every instance got his bird right out of the traps.

John Rothacker acted as referee, while Ed. Johnson officiated as scorer. A. A. Felix looked after Coleman's interests, while Gus Muller filled the same office for Coldren. The scores:

E. H.

Garfield Gun Club.

Chicago, Oct. 25.—The appended scores were made on our grounds to-day on the occasion of the fourth trophy shoot of the fourth series. Dr. Meek carried off the honors by scoring 24 out of 25 and won Class A trophy; J. McDonald won Class B on 22; Wilson won Class C on 17.

The cup shoot followed, and was won by A. Hellman on 22 out of 25, thrown as 15 singles and 5 pairs.

The day was very dark and threatening, and in fact it did rain heavily part of the afternoon. The attendance was not what it should be, but threatening weather and game season are responsible for it.

Fourth event, fourth series, 25 targets, as follows:

Kehl .....0111010101011111010100101—15
F Wolf .....1011111111111011111111111—23

IN NEW JERSEY.

John S. Wright's Shoot.

The live-bird shoot designed and conducted by Mr. John S. Wright, was held on the grounds within the boundary of the North Hudson Driving Park, near Hudson Heights, Hoboken, N. J., the same grounds where the Jeannette Gun Club now holds its monthly shoots. They are pleasantly situated and efficiently equipped for conducting live-bird shoots satisfactorily. Everything ran smoothly and pleasantly.

A few miss-and-outs were shot off before the regular programme commenced. In the first event at 7 birds there were ten contestants, most of whom were fairly well seasoned shooters. Mr. L. Connitz was one of the contestants, and made his first attempt at live-bird competition, though he has had extensive experience at target shooting. He was one of the five who killed straight in the first event. The money for each of the straights was $4.25.

The second event was at 10 birds, $7 entrance, and first money was $7.50. There were fourteen contestants, three of whom killed straight.

The third event was at 15 birds, $10 entrance, and in deference to the wishes of the participants the division of the moneys was changed from Rose system to high guns. Welles and Glover missed one each and were the only two in the tie on 14.

The weather was of balmy fall, an ideal Indian summer day. There was a mild south wind, which held the birds to fly straightaway. As to the birds, they were mixed in quality, slow and fast, just the kind to insure misses if the contestants relaxed in vigilance and tension. The scores follow:

Event 1, 7 pigeons, $5 entrance, two moneys:

C Von Lengerke, 29..2221122—7
L Connitz, 25.....1111221—7
S Glover, 31.....2212222—7

Emerald Gun Club.

Newark, N. J., Oct. 21.—The weather conditions at the shoot of the Emerald Gun Club to-day, held on Smith Brothers' grounds, were favorable to a thorough test of skill. The day was delightfully pleasant. There was a strong northwest wind blowing, and the birds were good and very fast. Four guests, Messrs. P. Garms, T. Cody, T. Morfey and F. A. Seitz, were present. They shot for birds only. No one killed straight in the club event. Three scored 9, namely, Messrs. H. Koegel, T. Morfey and F. A. Seitz. There were both a distance and a point handicap. Interstate rules governed the competition. The scores follow:

JAS. R. MERRILL, Sec'y.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Oct. 25.—The final shoot for the October cup took place to-day on the club grounds at Bay Ridge, hence there was more than common interest displayed by the shooting contingent, although it was almost a foregone conclusion that it would be won by Dr. J. J. Keyes. Messrs. Marshall and McConville had chances, however, and were defeated by the very narrow margin of one target. A contestant must participate in at least three shoots for the monthly cup, as his best three scores are what count in determining the winner. The three best scores made by Dr. Keyes were 48, 45 and 47, a total of 140, while McConville and Marshall got 139, Brigham 131.

October cup, 50 targets, handicap allowances added:

	Hdcp.	Total.	Hdcp.	Total.	Total.
W W Marshall	6	21	6	24	45
W J McConville	4	25	4	19	44
Dr J J Keyes	1	19	1	23	42
G R Meeker	5	19	5	18	37
C G Rasmus	4	21	4	14	35

The second event was at 25 targets, for a trophy, handicap, and was won by Charles A. Sykes. Scores: Sykes (4) 25, Meeker (5) 23, Keyes (1) 23, Lott (2) 22, Marshall (6) 22, McConville (4) 22, Vanderveer (3) 20, Fiske (7) 20, Rasmus (4) 20.

Trophy, 25 targets, handicap: Rasmus (4) 21, Vanderveer (4) 24, Stake (6) 20, Marshall (6) 18, McConville (4) 17.

Trophy, 25 targets, handicap: Keyes (1) 25, Marshall (6) 25, McConville (4) 24, Rasmus (4) 22, Pool (3) 19.

Trophy, 25 targets, handicap: Vanderveer (3) 24, Meeker (5) 21, Chapman (7) 14.

Trophy, 15 targets, handicap: Stake (3) 15, Sykes (2) 14, Marshall (3) 13, Pool (1) 13, Chapman (4) 12.

Match, 10 targets: Marshall 10, Chapman 9, Keyes 8, Rasmus 5, Meeker 5.

Brooklyn Gun Club.

Brooklyn, L. I., Oct. 25.—Mr. H. S. Welles was easily the star performer at the shoot of the Brooklyn Gun Club to-day. The weather was pleasant, and favorable for good scores:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	15	15	10	15	15	15	25	10	5p

The Passing of Authorities.

THE position of authority, once attained, would seem to be easy to hold. Time and the world's progress, however, are destructive to authorities. The authority, venerated in one age, may be a source of merriment in the next age. This is particularly true of the authorities on guns. In the short period of half a century there have been several quite distinct stages of evolution concerning them.

The work of Col. Hawker, bearing the modest title "Instructions to Young Sportsmen in All that Relates to Guns and Shooting," was considered a masterpiece of sound knowledge for years after its publication in 1830. The author of it, in recognition of its intrinsic merit, dedicated it as follows: "To His Most Excellent Majesty, William the Fourth. This attempt to instruct the rising generation in an art for which we have long been the first nation in the world, and an exercise acknowledged as being calculated to invigorate us for the service of our King and country, is with gracious permission most respectfully dedicated by His Majesty's ever dutiful servant and loyal subject, Peter Hawker."

Although written at a period of time within the remembrance of men now living, the quaint style of it and the obsolete ideas would seem to place it back in past centuries. The queer views and technical vagaries presented as exact knowledge will be interesting reading now, in comparison with the exact knowledge of our own times. Following are some excerpts:

The gunmakers, in short, remain again as I left them—like the frogs, without a king; and as before, complaining bitterly about the dullness of trade. But for this, they have to thank their introduction of the detonating system, by which they got caught themselves in the very trap that was laid for their customers. When flint guns were the order of the day few sporting gentlemen of distinction ever thought of using anything but the gun of a first rate maker, for the simple reason that on the goodness of the work depended the quickness in firing, and consequently the filling of the bag. But nowadays every common fellow in a market town can detonate an old musket and make it shoot as quick as can be wished; insomuch that all scientific calculations in shooting, at moderate distances, are now so simplified that we every day meet with jackanapes apprentice boys who can shoot flying and knock their eight birds out of ten. Formerly shooting required art and nerve; now for tolerable shooting (at all events for the use of one barrel) nerve alone is sufficient. Formerly a first rate gun was a sine qua non; now the most that we can call it is a desideratum; since all guns are now made to fire with nearly equal velocity. Still, however, fortunately for the leading gunmakers, there are yet left many requisites which induce good sportsmen, though a much smaller number than formerly, to go to the heads of the trade; viz., (1) soundness and perfect safety in guns; (2) the barrels being correctly put together for accurate shooting; (3) the elevation being mathematically true, and raised strictly in proportion to the length of the barrel; and (4) the stock being properly cast off to the eye and well fitted to the hand and shoulder. I say nothing of the balance, because any good carpenter with some lead and a center bit can regulate this to the shooter's fancy.

Within the few years the detonaters have been much improved in shooting in consequence of their being bored differently from flint guns. They now detain the shot longer in the barrel in order that the powder may have time to kindle, which is done to such a degree as to occasion an increase of recoil, and a liability to become "leaded" with much firing. Many waddings have been invented to counteract this, and I shall hereafter speak of them in another part of the book, as they have their merits; but still none of them will make a detonater of equal weight with, shoot quite as strong and regular as a flint gun. Though, like the rest of the sporting world, I have long been kidnapped into the constant use of detonaters, still I have no reason to alter the opinion I gave in 1822; and were my time to come over again, I might probably be content with the flint, though I have of course, as every one does, shot more accurately and missed fewer quick shots with the detonater.

For example: how is the barrel made to throw shot very close? By a too long continued relief forward without a proportional opening behind; this (from a want of that impetus or friction which the shot receive while passing through the cylindrical part of the caliber) makes the gun shoot so slow, that the sportsman often fires behind his game, and of course so weak, though well directed, that instead of his birds dying in the air, they are brought down in a slovenly manner, and half of them escape being bagged, although their skins may be filled with shot enough to make a brilliant display at a single sheet of paper.

Many are apt to suppose that if a bird, killed by a long shot, has been struck with four or five pellets, their gun will always be certain of doing execution at the same distance if properly directed. But so far is this from being the case that it may proceed from the barrel throwning the grains in patches, and therefore being liable to let even fair shots escape through an interval.

Indeed, the effect of this mode of boring might be equally well produced by wetting the shot, or loading with very little powder, and elevating so as for nearly all the shot to drop into the mark (a common trick when an old hand wishes to sell a gun to a Cockney or win the Christmas prize at an ale house by shooting at a mark). But enough of imperfections; and now for what a barrel ought to be:

With the common-sized guns, which are now made for the sports of the field, the usual mode of boring is to leave a cylinder for about three-fourths of the barrel (always taking care in a flint gun, but not in a detonater to preserve a little tightness or contraction just where the shot first moves), and let the remaining part of the caliber be gradually relieved to the muzzle. For instance, suppose a barrel to be two feet eight inches long, we would say (beginning at the breech end) about six inches tight (if for a flint); twenty-one inches a cylinder, and the remaining five inches relieved to the muzzle. All this must be done with the most delicate possible gradation, and in so small a degree that even some gunmakers can scarcely discover it. How natural then is it that many sporting authors should be so far deceived as to fancy the best guns are bored a true cylinder to the very muzzle, and therefore argue in its favor! This relief has the effect of making the gun shoot as close as it can do, compatibly with the strength and quickness required, which should, however, be increased as much as possible by the best constructed breechings. But with the new alteration for short detonaters, a mere cylinder or nearly so, with a few inches' relief forward, is now found to answer best, and therefore we require more weight of metal in order to ease the recoil of a charge that is longer detained in the barrel. Thus the detonating system simplifies the boring to the whole trade, as well as the art of killing to the shooter. With longer and heavier guns, we may take still further advantage, and have a little opening behind. All this relief must be given in a very trifling degree, because, should the barrel be too much opened in any part, it would admit of the powder escaping between the wadding and the sides of the caliber, by which the shooting of the gun would be rendered weak. For this reason, I should object to having a hole through the wadding that covers the powder, which many do to prevent, as they think, the confined air from resisting the ramrod, which it rarely does until after you have put in the second wadding.

For a duck gun or piece of any considerable length, the barrel should be bored so as to feel more and more tight on ramming down the wadding, particularly on coming just above where the shot lies, and with a very little opening from where the shot lies down to the breeching. This you will perceice by a relief to the ramrod just before the wadding reaches the powder. If, however, the gun is very long you may then of course have the barrel further opened behind, in proportion to the length, and thereby give more force to the powder, which will enable you with propriety to extend the relief forward, and by that means get close shooting combined with strength. This is the reason why long barrels may be made to shoot further than short ones. Thus the shot has friction by being forced through the cylinder, and is then gradually relieved all the way in going out, and this more in proportion again as the shot leaves the muzzle. In a word, the shot should receive all the force of the powder while tight in the barrel, and then, as before observed, go easier and easier all the way out of it. This mode of boring is the best calculated for large wildfowl guns, because the first friction makes them shoot strong (by means of giving due time to burn the powder), and yet with as much ease as any caliber that can be made to answer that purpose.

In answer to many absurd arguments in favor of short guns and observations about "lateral pressure," I shall here subjoin a schedule in order to show how were bored the five best guns I ever saw fired, exemplifying how far they were from being bored a perfect cylinder, and therefore proving the absurdity of those arguments which are all grounded upon this mistake. Were a gun barrel bored a true cylinder from end to end, it might shoot nearly, or quite, as well if two feet long as one of greater length, because a superfluity of what may be strictly called lateral pressure would do more harm than good, by checking instead of assisting the force of the charge. But to these two feet of cylinder let me add some more caliber, and that to consist of proper opening and relief, and then shoot the guns for a wager, and see how those new discovery gentlemen would come off who have been holding forth to the public such nonsense in favor of short guns.

Cannons are bored a cylinder, because they are generally used for firing ball, and therefore may be short; but how have they always thrown loose shot? Why, most miserably, till General Shrapnell invented his admirable shells that keep the charge together for a second explosion, which takes place a little before the shot has reached the object. It is one thing to speak of things plausibly, another to state them correctly.

In the following schedule I have taken three of the largest-sized guns, because a little sporting gun is on so small a scale, that although the relief may be felt in a moment by passing a proper gauge of lead through the caliber, yet the barrel is so diminutive that it would be difficult to measure and specifiy the exact depth of this relief.

N. B.—If any gunmaker had candidly informed me as to his mode of boring barrels, I should have felt myself bound in honor never to divulge much less to publish the secret. But as the little knowledge I possess has been acquired by my own discovery, and proved by experiments to be correct, it becomes my own property, and as such therefore I have no further hesitation in presenting it to my readers.

A SINGLE SWIVEL GUN.

Barrel made by Fullerd; average of bore 1½ inches; weight of barrel, 62 pounds; Cylinder, 2ft. 8in.; relief, 4ft. 1in.; opened behind, 6½in.; total (exclusive of plug), 7ft. 3½in.

Depth of Cut.—Relieved to the 20th of an inch; opened behind to the 24th of an inch.

MY NEW DOUBLE SWIVEL GUN (WEIGHT, 193 POUNDS).

Barrels by Fullerd: Cylinder, 2ft. 9in.; relief, 4ft. 2in.; opened behind, 1ft. 3in.; total (exclusive of plugs), 8ft. 2in.

Depth of Cut.—The bore in cylinder, 1½in. all but a 32d; relief forward 1½in. and a 32d (a 16th difference), and cut rather less deep behind than at the muzzle.

A SINGLE STANCHION GUN.

Barrel, 69lbs. (made in Birmingham); cylinder, 2ft. 7in.; relief, 4ft. 4in.; opened behind, 10in.; total 7ft. 9in.

Depth of Cut.—Cylinder, 1¼in. barely; relief, 1¼in. and a 16th; opened behind, 1¼in. and a 32d.

A SINGLE GUN.

(Musket bore and the average weight of a musket.) Cylinder, 1ft. 10½in.; relief, 1ft.; opened behind, 7½in.; total, 3ft. 6in.

A COMMON 14-GAUGE DOUBLE GUN.

(Weight altogether, 8½lbs.; barrels by Lancaster.) Cylinder, 1ft. 9in.; relief, 5in.; tight behind, 6in.; total 2ft. 8in.

Q.—Why is the common sporting gun tight behind, when the other guns are opened behind?

A.—Because a sporting gun requires to be fired so many times in a day that we must adopt an inferior mode of getting friction in order to prevent the barrel from becoming leaded; and therefore to make it shoot, through the whole day, nearly as well as when clean, and without recoil to the shoulder. Again, a sporting gun must of necessity be short for the convenience of covert and snap-shooting, and therefore the length that would properly suit that relief which must follow an opening behind (in order to prevent recoil and preserve close shooting) would be generally objected to as an inconvenience.

[Here I allude only to flint guns, as a detonater must, in a great degree, be debarred from this advantage, because if too tight behind, without any subsequent check, the powder would be blown away so quick as not to be half kindled. This is the new discovery in boring for detonaters, which I before alluded to, and which has probably saved them from being wholly abandoned.]

Q.—Suppose, then, you were to have your 14-gauge barrels 2ft. 10in., how would you dispose of the extra length?

A.—I would have 7in. of relief instead of 5in., by which my shot would be thrown equally strong and decidedly closer.

Gunmakers, who know their business, from their calibers more or less, according to circumstances, on the plans already stated, except those of rifles and guns for firing ball, which must be regularly tighter all the way out, as with these we have no reason to fear the want of strength or the risk of recoil, and the only object is to keep the ball in the straightest possible direction and regulate the barrel to the most accurate line of aim. This should be done by having the gun of the utmost length that can be used, and steadied by immense substance and weight of metal.

While speaking of rifles, I must not omit to mention two of the finest pieces of mechanism of the present age—Mr. Purdey's double rifles, and Mr. Lancaster's newly invented machine for rifling barrels. But to say what is here due to these excellent artists might lead me into a detail that would exceed my intended limits. I must, however, not omit to mention that there are just now invented new two-groove rifles, which are likely to supersede all others. Lancaster and Wm. Moore have already done wonders with them.

The further the sight at the breech is placed from that near the muzzle the more accurate of course must be the line of aim, and the heavier the gun the more likely you will be to preserve it in firing.

With regard to having a barrel too far opened forward, when left with mere cylinder behind, and the various tricks that are played to ease the explosion, for the sole purpose of throwing the shot as close as possible, it will be needless to trespass on the reader's patience.

Though a barrel, bored as before mentioned, will not shoot quite so close as it might be made to do, yet, taking everything into consideration, it has the tenfold advantage of doing justice to a good shot, and even assisting a bad one, by the irresistible force given, not only to the body of the charge, but also to the pellets which fly wide of the mark. Let the sportsman, therefore, rest assured that a gun which will shoot sufficiently close a surface to insure two or three shot (of No. 7 at 40yds.) taking the body of a bird, and at the same time distribute them in a regular manner, is better than a very close shooting gun. It was formerly the custom to make barrels, although so small as 14, 16, or even 22 in the gauge of three or four feet in length, and now since it has been ascertained that 2ft. 6in. will shoot equally well at the short distance of a gunmaker's confined premises, many have gone too much to the other extreme and cut them to 2ft. 4in. and less. The disadvantage of this is that even the best shots are more liable to miss, for, although we allow that a short gun at a short distance will kill as well as a long one, yet the latter gives you a more accurate aim, and considerably lessens the recoil, by which you shoot to a greater nicety and with more steadiness. To avoid all extremes I should recommend small barrels, never less than 2ft. 8in. nor more than 3ft. in length. My readers will observe that my remarks here have been altered since publishing my earlier editions. The late Mr. Joseph Manton, who knew at all events as much as, if not more than, any man in Europe about a gun, assured me after innumerable experiments he has proved that 2ft. 8in. for a 22-gauge barrel is the best proportion for a sporting gun. Take, therefore, a 14-gauge barrel and see whether or not I am right for recommending one of 2ft. 10in., and 3ft. where it can be used without inconvenience! But mind one grand point—have plenty of metal near the breech end, not only for strong shooting, but for good elevation. Let all barrels be tapered like a bulrush—no hollowing out, as this ruins their shooting.

It may be thought a bold assertion, but I have every reason to believe that we have all, to this very day, been completely in the dark about the length of guns. Mr. Daniel (speaking of a duck gun) said that a barrel 3ft. 8in. is "as capable, or more so, of throwing shot sharp and distant as a barrel 2ft. longer." In my second edition (deceived in the same manner that all the gunmakers have been, by not having made their trials on a sufficiently large scale), I gave it as an opinion that except the aim being better and the recoil less a long gun had no advantage over a short one. On the contrary, I have now proved that a short gun has no chance with a long one, in keeping the shot well together at long distances.

The experiment must not be tried with little pop guns that are used for pigeons and partridges, but by guns on a gigantic scale, by which we can make every observation in the clearest possible manner, with the same advantage that an astronomer, with his large telescope has over the naked eye, or diminutive glass in discovering a planet.

I had once made up my mind that a barrel, of whatever size it might be, would kill the furthest if made forty-eight times the diameter of the intended caliber, and entered in the manuscripts for my third edition some observations to that effect. But had they gone to the press, I should have been open to the criticism of every good experimentalist, for I have since discovered that the larger the gun the longer it must be in proportion, because the further the shot has to travel the greater the resistance of the atmosphere. In addition to my own experiments, I am indebted for the perusal of several observations (which corroborate my opinion on them) to that excellent engineer, General Shrapnell, of the Royal Artillery. I shall, therefore, say no more by way of argument, but lay before my readers one of the clearest proofs, selected from the number I have made:

Trial, taking the average of several shots, at twenty sheets of thickest paper, at a target placed in the middle of a sheet of water, in order that all bystanders may see fair play as to correct shooting:

Distance, 90yds.; shot, BB.

A best finished London duck gun; weight of the barrel, 59lbs.; bore, 1½in.; length, 5ft. 8in.: Number of grains in first sheet, 26; in twelfth sheet, 10; in twentieth sheet, 8.

A Birmingham gun, weight of barrel, 69lbs.; bore, 1¼in.; length, 7ft. 9in.: Number of grains in first sheet, 50; in twelfth sheet, 35; in twentieth sheet, 22.

I then sent my gun to the late Mr. Durs Egg, desiring him to get the same barrel forged by Fullerd 1ft. 10in. longer, making it 7ft. 6in.; and by means of unavoidably being obliged to reduce the metal after joining it, the barrel when sent home was scarcely 3lbs. heavier than before. I then shot the gun about twenty rounds and the average was: Number of grains in first sheet, 46; in twelfth sheet, 30; in twentieth sheet, 20, by which it evidently appeared to me that if the metal is disposed of in length, it has the advantage over a short, thick gun.

From having 10lbs. more weight of metal, however, the Birmingham gun still had rather the advantage, because it carried 17oz. pleasanter than the other carried 15.

Substance and length, therefore, are what we want in as great a degree as can be used without inconvenience.

For instance, fire a 14-gauge sporting gun 2ft. 8in., or forty-four diameters, at a gunmaker's iron door, against one of 3ft., and there will probably be no difference. But go out in an open field, and particularly on a windy day, with the 2ft. 8in. barrel, and try it at 60yds., and after the shot have gone about two-thirds of the distance, they will begin to open in oblique directions, where the 3ft. barrels keeps the shot together. For instance, take a funnel (or a paper cut triangularly like one) 4in. in diameter, pin by a sheet of brown paper, and stand at three or four yards from it. Then look along either edge of the funnel, and you see how very wide a cylinder thus relieved carries the outer parts of its circle beyond the paper. Then take a funnel of the same diameter 8in. deep, and you will see how much more of the funnel is filled with the paper.

Now, as guns must be relieved in order to shoot well, I take all this in the extreme, the more clearly to demonstrate why length has the advantage at long distances. But, on the other hand, go almost close to the paper, the short funnel will lay the whole of its circle within it, and the long one can do no more, and therefore, at this distance you give no trial. So it is with barrels that are tried in a gunmaker's yard, and at the usual distances. Moreover, the extreme friction that is absolutely required to send a charge strong has the effect of scattering and recoiling so much in a short barrel that a certain sacrifice of power must be made. But in a long barrel, which admits of greatly increasing the relief, the shot are kept without any sudden check so long together, after this violent concussion, that we are enabled to combine both strength and closeness in the most powerful degree; and this, together with less recoil and a better aim. We have therefore been half a century making, as it were, the tour of the world in guns, and at last come home again, to discover that in regard to the length of barrels, we were not so near the mark as our grandfathers!

Mr. Durs Egg, in opposition to the whole trade, and all the sportsmen, weathered the storm and always maintained the same opinion. We all laughed at him, but before he died it was his turn to laugh at us, as he could with justice say that, on this point, he knew more than all of us put together!

Be cautious, therefore, of shortening an old barrel that shoots well, and recollect also that if much of the length is taken off you alter the relief.

As a gun which is top heavy is inimical to quick shooting, the usual plan, unless the barrels are very short, is to make them "light forward"; that is, thin toward the muzzle. This I conceive to be bad, as a barrel which is everywhere tolerably stout is not so liable to expansion, and consequently will shoot stronger and last many more years than one which is rendered so by being in any part too thin. A gun thus substantial can always be made to mount well by being properly balanced with lead under the heel-plate, which will be far more convenient and neat in appearance than a huge piece of wood for the butt, and will thus admit of the stock being made light and elegant

In choosing the size of a caliber it may be considered that a 14-gauge is at all events the best for a bungler, and on the whole, the most destructive gun. But, with a very accurate shot, the size is not of so much consequence for killing game, as the necessary substance to prevent the recoil of a large bore cannot be brought to bear so quick as a somewhat lighter gun; and therefore, what is gained by weight of metal might be lost in time.

Sistersville Gun Club.

SISTERSVILLE, W. Va., Oct. 23.—The fall tournament of the Sistersville Gun Club was held Oct. 21 and 22, at Sistersville, W. Va., and we are very glad to be able to report that the affair was quite a success from start to finish. The attendance was not what was desired or expected, but those present had a very enjoyable time. Two more perfect days for the shoot could not have been made to order. Bluerock targets were thrown from a magautrap, and those present were very much pleased at the manner in which the trap did its work, but few targets being broken by the trap during the two days. Mr. J. T. Atkinson, of New Castle, Pa., carried off the honors for the entire programme by breaking 378 targets out of the 400. Mr. John F. Mallory, of Parkersburg, was close at his heels with 377. On the first day, Mr. Atkinson was high with 192 out of the 200, but Mr. John F. Mallory gained a lap or two on the second day by duplicating the performance. The following are the scores:

	Shot at.	Broke.		Shot at.	Broke.
J T Atkinson	400	378	C I Hall	400	330
J F Mallory	400	377	J M Speary	200	185
Ed O Bower	400	352	T S Bibbee	200	181
Cole	400	341	W Trapp	200	175
S T Mallory	400	338	P Schlicher, Jr.	200	170
C J Mowery	400	338	H Murkle	200	167
T Thompson	400	336			

The Trade was represented by Mr. Walter Annette, who was goon enough to act as cashier, and too much cannot be said for the very satisfactory manner in which he did his work. We take off our hat to you, Mr. Annette, and when we have another tournament he may expect an invitation to fill the same old job.

LERANZO.

Good Shots but Wrong Targets.

A CURIOUS light is thrown on the reports issued as to the brilliant success with which the submarine torpedo war ships were credited in the recent maneuvers, by a dispute which is now in progress, and which so far reveals the fact that the torpedoing of submarines is entirely a matter of imagination, not even dummy torpedoes being discharged. The rule laid down during the maneuvers was that if a submarine rose to the surface at a spot toward which the particular warship attacked did not have a gun aimed, the submarine could claim to have torpedoed the war ship. The officer in command of the submarines issued to each boat a bottle which, when floating in the water, was very similar in appearance to the sighting apparatus on the top of the submarine's conning tower. The bottles were allowed to rise during the maneuvers. Immediately one appeared the nearest war ship poured a heavy fire upon it, whereupon the submarine would rise on the other side of the war ship and claim to have sunk her.

The officers on the war ships were highly indignant at the trick, and it is now proposed to have the maneuvers over again, the submarines to use dummy torpedoes with detonators at the nose, so that there shall be no mistake if a vessel is really struck. —Cherbourg Letter to the London Express.

Mountainside Gun Club.

West Orange, N. J., Oct. 25.—The Mountainside Gun Club held its weekly shoot to-day. The programme consisted of six 10-target events as follows:

First event: C. J. Ziegler 6, J. McDonough 5, W. Rollinson 5, R. O'Gorman 5.

Second event: W. Rollinson 9, J. McDonough 6, G. Kent 6, C. J. Ziegler 6.

Third event: W. Rollinson 9, R. O'Gorman 7, C. J. Ziegler 7.

Fourth event: J. McDonough 9, C. J. Ziegler 7, W. Rollinson 6.

Fifth event—W. Rollinson 8, C. J. Ziegler 8, R. O'Gorman 6, J. McDonough 6.

Sixth event: W. German 7, G. Kent 6, J. Gantz 6, F. W. Blunk 6, A. W. Baldwin 6, C. J. Ziegler 6.

The next shoot of the club will be held on Election Day, when prizes will be contested for.

Crawfordsville Tournament.

CRAWFORDSVILLE, Ind., Oct. 22.—Another year has passed away, and the lovely Indian summer lingering with us, caused the Crawfordsville trapshooters to announce a fall tournament. As this was the nineteenth annual, they desired to increase the popularity of their tournaments, so they went about it in what we term "blooded" style. A programme was printed, naming ten 20-target events, a total of 200 targets; and with no one barred, all to stand at 16yds., this served to draw the best shots, and those not stayers did not honor the club with their presence.

The management of the shoot feel on those who have been conducting these tournaments for years. Few men enjoy a more extended acquaintance among shooters than Ed Voris, while locally Frank Snyder and Max Stillwell are about as well known. Then there are Lacy, Helm, Washburn and others.

During the past year the greatest improvements ever made here have been undertaken, and now the club house is one of the best in the State. The grounds face north, and are fine and suitable for all kinds of shooting. These grounds will be the center of attraction for many years to come, as concerns the shooters of this and the adjoining States.

The day was fine, and many ladies were present to enjoy themselves as they watched the shooting while comfortably seated on the veranda of the club house.

The splendid dinner served by the Superintendent, Mr. Deitrich, was much enjoyed.

If clubs only knew how much pleasure there is in a good commodious club house there would be more of them erected and maintained.

Those who came to shoot were Gus Mollen, Indianapolis, Ind.; Rolla Heikes, Dayton, O.; Geo. Roll, Blue Island, Ill.; Milt. Cooper, Indianapolis; C. O. Le Compte, Eminence, Ky.; H. M. Clark, Wabash, Ind.; Ernest Tripp, Indianapolis; C. O. Parsons, Frankfort, Ky.; M. W. Thompson, Lafayette, Ind.; E. E. Adamson, Muncie, Ind.; W. A. Wildhock, Indianapolis; H. B. Adney, Lebanon, Ind.; H. A. Cook, Laduga, Ind.; R. T. McGibbens, Sullivan, Ind.; H. A. Forbes, Muncie, Ind.; Wm. Grimes, Alamo, Ind.; P. M. Dooley, Lebanon, Ind.; J. E. Schroyer, Lebanon, Ind.; B. S. Thompson, Danville, Ill.; C. B. Wiggins, Horner, Ill.; W. H. Veitmeyer, Chicago, Ill. E. C. Fort, Fostoria, O.; Fred Lord, Chicago, Ill.; Bert B. Adams, Indianapolis, Ind.; C. H. Peck, Remington, Ind.; H. Money, New York; Dr. O. F. Britton, Indianapolis, Ind.; F. M. Rice, Bowers, Ind.; Miss Ophie Parson, Frankford, Ind.; Wm. Nash, Indianapolis; Bert Adams, Indianapolis.

Roll Heikes was high score for the day, averaging one target better than nineteen for the ten events. Clark, of Wabash, was but two, and then next came Geo. Roll with 186. Partington did well, making the 90 per cent. hole, while Money, Wiggins and Thompson landed in the 179 place. The scores:

Oct. 23, Second Day.

There have been many sparrow tournaments held during the past, confined for the most part to Indianapolis and Crawfordsville, Ind., yet if my memory serves me right, to-day's tournament may be put down as the most successful one yet conducted in this "neck o' woods."

This is true in every sense.

The birds were of the most lively "bumble bee" order. The grounds are really perfection. The trapping was simply "out of sight." The shooters were of the highest type of American gentlemen. The day was of the delightful Indian summer. The dear ladies were out without wraps, and Crawfordsville ladies are not slow in appreciating and taking part in their husband's outings, and thus adding to their pleasure.

After these twenty years or more experience that the Indianapolis people have had with sparrows as successful mediums for trapshooting, how very strange it is that there is yet only one sparrow man where shooters are so numerous in this country, and where the dirty English sparrow has accumulated so fast and taken possession of the whole land? Johnny Bull, when at a banquet in America once upon a time attempted to get off something on the sparrow, and proceeded after this fashion:

"The sparrow, to make a nest, went up the spoot,
But the rain came down and drowned 'im oot;
The sun came oot, dried hup the rain,
The blooming beggar went hup the spoot again."

Endeavoring, I suppose, to show the persistence of our English cousins.

Be that as it may, there is nothing used for trapshooting that gets away as quickly and beats the jacksnipe by far in his unexpected movements, and proves so amusing to shooters and spectators as the little beggar tops the boundary fence. If this only sparrow man, Hill, could make all the cities with a good supply of birds and traps it would not be long until there would be sparrow matches as numerous as the live-bird matches have been heretofore.

Yesterday the management were counting on about fifteen men for all the events of to-day, yet the very first match showed up a total of twenty-eight entries. Not only had most of the boys remained over, but there were additions of Adamson, of Muncie; Phellis, of Cincinnati, O., and Thompson, of Greencastle. Mr. Adamson was so busy talking up Graphine that he did not shoot in many events, but one Phellis let 'em know that he was on to the little "owriness" of the festive sparrows, while Thompson did not get much up in the money, he stuck to the game from first to last.

The first match consisted of 10 birds, and had twenty-eight entries, and when twenty-five men, or five squads, had shot, there was not a man equal to the task of killing 10 straight. As there are so few sparrow shoots it will not be amiss to show your readers that sparrows are trapped by the use of fifteen traps. Each shooter has three unknown traps before him, and the shooter walks around after each shot, same as the old style of five traps, target shooting. Providing the trapping was done from pits, the sparrows could be shot as fast as targets, as there is no gathering of birds. A bird once touching the ground in the boundary is a dead bird. Sparrow rules are somewhat different from live bird rules. The rise is 25 or 26yds., 35yds. boundary; use of both barrels; three unknown traps, etc. The last squad in this first event was not full, so E. H. Tripp and H. Money were permitted in this squad, and when they went out with 10 straight each, they were delightfully surprised to find that they were the only ones to do it, while such good ones as Heikes and Snyder, first men up, had each lost 4.

But Heikes got even the next time by going straight, having Phil as a partner. Money and Tripp lost 3 each. Geo. Roll, of much good pigeon fame, here shot his first sparrow, and made 14 straight; he was second alone.

Coming to the big race of 50 birds, $15 entrances, there was something to test the skill on a long race. The scores may not seem good, but you take the writer's word for it, that had you seen the birds you would have agreed on this proposition.

There was one man who held the Fort, as he missed but one out of the first 43; yet he had a hard luck story on the last 7, losing 2, including the fiftieth. Forty-seven is a great score, and not likely to be duplicated.

Money and Phil were very close, with only 4 to the bad, showing that constant practice will avail much. Phil shot the most gamy, uphill race, as he had to put the last 20 to the ground to get into second place. Heikes made the second longest run of the day, 28, and landed in the 45, as did Clark, of Wabash. Wiggins lost but one bird out of the first 28; and then drew five impossibles, and stood to win the fourth money all alone. As there was $180 in the pot, each winner was well rewarded, especially Mr. Fort, whose green sweater is still conspicuous, though the card heretofore worn on the back has been removed..

During the next three matches not a straight score was made, and E. H. Tripp, after doing very poor shooting, for him, won the last event alone, thus winning both first and last match.

At the close of the programme a double match was shot, which furnished much amusement. About half the little miscreants got away to "chirrup" about people's windows and keep them awake on Sunday mornings as of yore.

After shooting a couple of target races, the supply of shells had been exhausted, and all being tired, were willing to leave the ground.

The kickers were not here. They had no use for "kicks." All will come next year and bring a friend.

Long live the Crawfordsville shooting fraternity.

The scores in detail follow:

Event No. 1, 10 sparrows, $3 entrance:

Snyder	0011010121— 6	Lord	1212102121— 9

Trap Around Reading.

READING, Pa., Oct. 23.—A shoot that was open to all was given by the South End Gun Club on its grounds, on Boyer's Island, yesterday afternoon. Fred Gilbert, of Spirit Lake, Ia., champion wing and target shot of America, was present and gave a performance that has never before been equalled on any local ground. Shooting over a magautrap, he broke 100 targets straight. Messrs. W. L. Colville and L. J. Squier were also on the grounds and participated in a number of the events. All three are well known in Reading, and they were heartily greeted by their friends. This was Gilbert's first visit to Reading since the State tournament, in the spring of 1898.

The scores follow:

DUSTER.

Interstate Tournaments for 1903.

Editor Forest and Stream:

Gun clubs contemplating giving tournaments during the season of 1903, and desiring the assistance of the Interstate Association, should have their applications in the hands of the manager by Dec. 8, in order that they may be presented to the tournament committee for action thereon at the annual meeting of the Association, Dec. 11, next. The Association would be especially pleased to receive applications from gun clubs situate in the Middle West. Send all applications to and address all letters for conditions under which tournaments are given to the manager's home address, 111 Fourth avenue, Pittsburg, Pa. ELMER E. SHANER.

PITTSBURG, Pa., Oct. 25.

Gilbert—Klein—Burmister Tournament.

SPIRIT LAKE, Ia., Oct. 24.—The Gilbert, Klein and Burmister three-day fourth annual tournament was not as well attended as expected. The programme was a liberal one and should have drawn a good crowd of shooters. It had eight 15 and two 20 target events for amateurs, and two 25 open events for each day, with $5 added to each event.

On the second day a handicap 50-target event, open to all, $5 entrance, and a cup to go with first money, was shot. A handsome cup was given to the amateur making high average.

W. R. Crosby, shooting from the 22yd. mark, won the cup and first money in the handicap, scoring 46, a very creditable score, as the targets were thrown about 60yds. Guy Burnside made high average in the amateur class, and won the cup. Burmister and Lee, of Spirit Lake, have invented a trap pull by which all the traps are pulled in rotation by one wire and level. It worked to perfection. Owing to the light attendance the third day's programme was not shot, and the day was spent in shooting ducks, fishing and catching frogs. Tom A. Marshall won high average in the frog contest, while Dr. Cook made the largest bag on ducks.

First Day, Oct. 21.

Events:	1	2	3	4	5	6	7	8	9	10	11	12

HAWKEYE.

Mr. Floyd's Disappointment.

NEW YORK, Oct. 23.—Mr. Editor, will you listen to my little tale of woe? After waiting a sufficient time for Mr. I. A. Hudson, of Dagsboro, Del., to cover my deposit to bind a match, I find check returned to me from you and in answer to my letter from your office, saying "Nothing doing" in Delaware.

From the way Mr. Hudson wrote to FOREST AND STREAM, I really expected him upon the next train to coax me to shoot him a match. I am indeed surprised to find that he is a shooter with his pen instead of with his gun.

One would think from the tone of the challenge he sent me through FOREST AND STREAM that Mr. Hudson was green at trap, but such is not the case. Eight years ago I shot him a 50-bird race at Ocean City, Md., and defeated him. Five years, or about that time, later I shot him another race and defeated him again. During all of these years, Mr. Hudson has had a trap on his pea patch of a farm and was practicing at every opportunity.

I think Mr. Hudson wants some cheap advertisement, and picked me out to get it for him. As I look at it, I would lose five pea patch farms before I would go into my hole as he has done, and be branded as a shooter with the pen.

Mr. Editor, if there are any more shooters like Mr. Hudson in Sussex county, Del., throw their challenges into the waste basket, unless the money accompanies the challenge; and if the money is there, let me know it. I will be at your office, or check will, in few hours afterward, for I think it would be finding money to shoot any one I have seen or heard of from Sussex county, Del.

I also wish to state that my farm is in Maryland and quite a ways from Mr. Hudson, as his is in Delaware—if he calls his one.

CHARLES W. FLOYD.

Ossining Gun Club.

OSSINING, N. Y.—Am sending scores made Saturday, 25th inst. Notice they are strung out to make them look as large as possible. Most of our regulars are off on shooting trips. The two inveterates, Bissing and Washburn, are away, and the little parts they play in our Saturday matinees are missed. The former is up in Aroostook county, Me., after a moose, and the latter is after the few partridges he left for seed up in Sullivan county last fall. Scores:

KILLMORE.

PUBLISHERS' DEPARTMENT.

The shotgun, choked for trap, duck, and other long-range shooting, is also serviceable for ruffed grouse, quail and other cover birds, when the shooter uses in it ammunition containing the Hummer Shot Spreader. They are manufactured by Mr. Daniel Brown, Thornton, R. I., who will be pleased to send them, or information concerning them, as set forth by him in our business columns this week.

The Winchester Repeating Arms Co., New Haven, Conn., now offer, through the trade, their .22cal. rim-fire cartridge, sometimes known as the .22-7-45, loaded with smokeless powder and Winchester greaseless bullets, which have proved eminently successful,

Guns, Revolvers, Ammunition, etc.

LIKE GOOD WINE

Du Pont Smokeless Powder

IMPROVES WITH AGE.

In the Hill Top Handicap, Austerlitz, Ky., Messrs. Fred Gilbert, from 32 yards, and R. S. Rhoads, from 30 yards, at fast birds, in a **thirty-three yard** boundary, each scored 46 out of 50 live birds. In the shoot-off Gilbert scored 9, Rhoads 8.

They both used shells that had been machine loaded in 1897 with **DU PONT SMOKELESS.** After being loaded **five years,** the Du Pont Smokeless won the Handicap and first money in competition with experts and fresh loads of various brands.

READERS AND CONTRIBUTORS.

Everybody knows that FOREST AND STREAM has tens of thousands of sportsmen readers. Did it ever occur to you that every year between 3,000 and 5,000 sportsmen write for it? Take the great West, for instance. Western sportsmen send it stories of their adventures with grizzlies and mountain lions; of hunting the deer, the elk, the mountain sheep; of shooting prairie chickens, grouse, quail and ducks; of fishing for trout, bass, pike, pickerel and muscalonge; of wolf and jack rabbit coursing; with talk of gun, dog and camp—in fact, pictures of every phase of a Western sportsman's life. And as in the West, so in the East, the South, the North, Mexico, Canada—everywhere. This is why FOREST AND STREAM has come to be in every section the sportsman's favorite journal. This is why we want you to know it, to read it, to write for it, to join the great army of those who are helping to make it, who are enjoying its reading every week. It is a bright, clean, healthy, manly paper for you and your family. The subscription price is $4.00. Address

FIELD GUNS.

When, 15 years ago, we introduced the light weight, short barrel 12 gauge **Featherweight Francotte Guns,** most hard practical field shooters who were lugging their 8 or 9 pound guns when following their bird-dogs, shook their heads and very much doubted that anything like the same bag could be made with these "grasshopper" or "mosquito" guns as with their heavy old-fashioned guns.

When, however, one of these full-choked little guns made highest percentage of pattern and penetration in gun trial where most of the leading guns competed and when others were winning highest honors at the trap—then, public opinion began to change. Since then thousands of our Francotte and Knockabout Guns have gone into the hands of leading sportsmen.

FRANCOTTE AND KNOCKABOUT GUNS have always kept well ahead of all competition as regards shape and model, strength coupled with light weight, shooting and wearing quality, fit and finish, and the ownership of either make of gun is a testimonial as to a sportsman's standing.

FRANCOTTE GUNS, all gauges, weights, length of barrels and shape of stocks from $80.00 to $450.00 net.

KNOCKABOUT GUNS, all gauges, weights, lenght of barrels and shape of stocks, $60.00 net.

We are willing to take your second-hand guns as part-payment for new ones.

MAUSER SPORTING RIFLES, $45.00 to $50.00.

FIRST COST

VS.

OPERATING EXPENSES AND PROFIT

As Applied to the Modern Shot Gun.

You will hear it said that GREENER GUNS are high priced, and so they are—comparatively.

A trolley line is also expensive, and the cost to build an elevated railway is enormous, but if it is well done and the best material used they last indefinitely and begin to show a profit almost at once, even at so low a fare as five cents per passenger.

The same argument can be urged to the purchaser of a Greener gun. The first cost is considerable—necessarily so—for the labor is skilled, the material the best and the brains and experience of the maker all count for something.

Ordinary guns, and guns turned out by machinery, only last a season or two and are then discarded and begin a fitful downward career until they are finally lost in oblivion.

A Greener Gun, on the contrary, does not fairly begin life until it is several years old, and the few thousand shots that will rack the cheap gun to pieces simply smooths out the Greener and acts on it like oil on a fine bearing, and emphasizes those niceties of fitting that were part of the original cost, and which makes a gun really worth having.

Dr. Carver shot a Greener gun over a million times, and we have the gun here now—would not take $1000 for it—and it is in good condition yet after all these years.

If you want a gun that will shoot the strongest and the longest, pay a little more and buy a Greener. Eight gauge to twenty-eight gauge in stock. $100 to $600.

WINCHESTER

BOX MAGAZINE REPEATING RIFLE MODEL 1895.

.35 CALIBER.

WE have adapted the Winchester Model 1895 box magazine repeating rifle to handle a new Smokeless Powder cartridge, known as the Winchester .35 Caliber, which is the most powerful shooting cartridge, at both long and short ranges ever offered. Rifles for this cartridge are made with 24 inch round nickel steel barrels, and weigh about 8 1-2 lbs. The Winchester .35 Caliber Cartridge embodies high velocity and consequent flat trajectory, great energy and striking power, making it a very desirable cartridge for hunting the biggest game known. Some idea of its tremendous killing power may be gained from the fact that the striking energy of this cartridge at 200 yards equals the muzzle energy of the .45-70. This cartridge is loaded with a 250 grain soft point metal patched bullet, and special Smokeless powder, which imparts to the bullet a muzzle velocity 2,200 foot seconds, thereby developing a muzzle energy of 2,685 foot pounds. The penetration at 15 feet from the muzzle is 15 7-8 inch pine boards. Owing to their size and high velocity, .35 Caliber soft point bullets upset, or mushroom, in a most perfect manner. Send for circular fully describing this rifle.

CANOE CRUISING AND CAMPING.

By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.

This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.

Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

By DIXON KEMP, Associate Institute of Naval Architects. Price $12.

This edition has been largely re-written, and contains a great number of new subjects, and the lines of many boats never before published, the total number of plates exceeding 100, besides more than 350 woodcuts in the text. Contents: "Selecting a Yacht," "Examination of the Yacht," "Building a Yacht," "Equipment of the Yacht," "Seamanship," "The Management of Open Boats," "The General Management of a Yacht," "The Rules of the Yacht Racing Association," "Yacht Racing; Handling a Yacht in a Match," "Centerboard Boats," "Centerboard Boats for Rowing and Sailing," "Sails for Centerboard Boats," "Small Centerboard Yachts," "Mersey Sailing Boats," "Clyde Sailing Boats," "Belfast Lough Boats," "Dublin Bay, Kingstown Boats," "Cork Harbor Boats," "Itchen Boats," "Falmouth Quay Punts," "Thames Bawley Boats," "Lake Windermere Yachts," "Yachts of the Norfolk Broads," "Small Yachts and Boats of Y. R. A. Rating," "Singlehanded Cruisers," "Types of Sailing Vessels," etc.

FOREST AND STREAM PUBLISHING CO.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1902, BY FOREST AND STREAM PUBLISHING CO.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, NOVEMBER 8, 1902.

VOL. LIX.—No. 19. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

A journey on foot hath most pleasant commodities; a man may go at his pleasure; none shall stay him; none shall carry him beyond his wish; none shall trouble him; he hath but one labor, the labor of nature, to go.—Petrarch.

TO MARK OLD SITES.

THE "Record of the Old Missouri" described in last week's FOREST AND STREA can hardly have failed to bring up to the mind of many a reader a host of memories of the ancient times. Things move fast in this country. Yesterday, as it seems to some of us, we rode across dusty plains, here and there black with buffalo, in other places dotted with yellow antelope whose slender black horns showed like fine lines against the blue sky as the pretty animals stood on some near-by knoll and watched us, or trotted nearer and nearer to see what manner of creature it was that had intruded on their feeding grounds. To-day through the same country we pass on the hurrying railway train, or, if by wagon or on horseback, we are forced to follow the zigzag roads which by half-mile rectangles follow the lines of the quarter sections. Buffalo and antelope no longer meet the eye, but instead we see houses and barns and stacks, and fields in which feed heavy cattle, followed by rooting hogs.

The human population has been swept away with the brute. Trapper and Indian and United States soldier have moved onward; out of existence, to a reservation, or to the distant islands of the Pacific. If one asks the modern resident about the conditions which prevailed before the settlement of the country, it is found that he knows no more about it than the conductor of a car in Chicago or New York. So short is human memory; so completely do the affairs of the present crowd out from the mind the happenings of the past.

Scattered along the valleys of the Missouri River and its tributary streams, as well as on many rivers hidden among the fastnesses of the mountains and whose waters at last pour themselves into the Pacific Ocean, there existed, not more than fifty years ago, the remains of many old-time trading posts. Some of them were then still occupied dwellings, or, if not occupied, were ruins whose remains were yet plainly to be seen. For long after the wooden or adobe building had decayed and disappeared, the depression which marked the old cellar and the stone chimneys remained as monuments of what had been.

The people who used to inhabit these old posts, by whose energy they were erected, by whose study and laborious vigilance they were made successful, or through whose slackness and carelessness they failed, are dead now. Long, long ago the fans of the death angel began to winnow their ranks, and it may well be that there is not now left one of those sturdy men who between 1830 and 1840 penetrated the wilderness of the great West, and prepared the way for the innumerable multitudes who fifty or sixty years later followed them, and to-day are still crowding into the territory which lies between the Missouri River and the Pacific Ocean.

In his excellent work on the "American Fur Trade," Captain Chittenden has given the names of many of these old-time trading posts, and has described their locations. But for the most part the local population is ignorant, not only of the situation of each of these posts, but even of the very fact that such a post existed.

The sites of these old forts ought to be marked in an imperishable way. They are memorials of the early history of nearly one-half of this country, the first sproutings, so to speak, of a plant which has grown and flourished, until it has covered a vast expanse of the continent.

In many of the newer States of the West there are historical societies which have done and are doing most useful work in collecting facts concerning the early settlement of their several States and putting them on record. Notable among such societies is that of Montana, in which Hon. Wilbur F. Sanders, and his son, James U. Sanders, are active. Nebraska and Kansas have each energetic historical societies, and only about a year ago the Kansas Historical Society was instrumental in erecting a monument on the site of the Pawnee village where the heroic explorer Zebulon M. Pike first unfurled the United States flag west of the Missouri River, and planted it among the Pawnees, taking down the Spanish flag, which had been raised there but a short time before.

In every State and in many counties in these newer States, there are people who, if the idea were but suggested to them, would gladly take steps to mark the historic sites which each possesses. This is being done more and more in the East, and even there it is often difficult to establish the exact locality of a particular happening or a particular structure. The dwellers in the newer West are better off in this respect than are those in the East, because less time has elapsed since the events, and so information concerning people and places is more accessible.

It would be well if this matter could be taken up throughout the West, and arrangements made to mark, at least by substantial square stone posts properly inscribed, the situations of these old trading posts. On the Missouri, the Yellowstone, the Arkansas, the Laramie, the Plattes and elsewhere, there should be lasting memorials of these earliest permanent white habitations in the West.

THE LONG-RANGE PERIL.

THE deplorable hunting fatalities, incident to the use of the rifle by big-game hunters in the season of big-game shooting, seem to increase with each passing year. In the view of the layman, big-game hunting has quite as much of menace to life as pleasure to the participants.

The daily press, with regrettable frequency, recounts the death of some ill-fated hunter or hunters from the effects of rifle bullets. Either directly or by implication each death is ascribed to careless or reckless shooting as a cause.

It may fairly be conceded that a certain percentage of this mortality is due to carelessness or recklessness, but it is unfair and unsound to ascribe all of it to either cause. There is no occupation in life which is free from accident. Wherever high-powered forces are employed by man, accidents will happen to men, accidents which are beyond the power of human beings to foresee or to guard against. Even in the commercial world, where men are duly trained and tried, accidents are numerous. The electrician, the engineer, the miner, and other skilled artisans, kill and are killed. Out of the lot of destruction so-called accidents happen which, by proper care, could have been avoided. Such are not accidents in the true sense. In the commercial world, he who kills or maims carelessly or recklessly is considered guilty of a criminal act, with all the grave legal consequences to the offender which, in the eye of the law, is befitting the case and its circumstances.

The same, or even harsher, judgment is gradually taking legal form concerning hunting accidents. Indeed, there have been so many deaths or woundings which were due to carelessness or recklessness, that on the part of the public there is an assumption of reckless shooting whenever a death or wounding happens, and a prejudgment of the offender accordingly. Such prejudgment is, in a measure, unjust, since accidents cannot be entirely eliminated from the use of firearms afield.

However, conceding that there are accidents which are beyond the power of man to prevent or foresee, and conceding that with the increase in the numbers of the hunters who engage actively in the sport of big-game shooting, there consequently would be an increase in the number of accidents, there nevertheless are indisputably many deaths and maimings due to ignorance concerning the use of the rifle and its powers, and carelessness and recklessness in its use, with a full knowledge of the rifle's possibilities for harm.

There is a growing public belief that most of the accidents, apart from mistaking a man for a deer, are caused by the modern high-power rifle. This belief is confirmed and disseminated broadly and convincingly by the daily press. The signs of the times indicate that, if the fatalities continue in the future as in the past, public sentiment will result in an entire prohibition of high-power rifles within civilized limits, other than military and club grounds. Aside from the menace to life and limb, big-game hunters, for the sake of the sport and the guild, should eschew the full-jacketed bullet and the high-power charges. The manufacturers provide proper cartridges for high-power rifles when used in settled sections, thus reducing the danger to the minimum. Manufacturers, for their own self-interest, should strenuously preach the doctrine of special loads for special sections, for the matter of what will kill big game in the most deadly way is secondary to the safety of the community. It should be clear to the manufacturers that the use of high-powered rifles in a qualified way is much better than a prohibition of their use entirely.

The conditions governing big-game shooting at the present time differ widely from those governing a few years ago. The game area is much less, so that, even if there were no more hunters, there would seem to be more owing to their being more concentrated. Towns, farms, homes, have so reduced the wilderness that it is no small task to journey out of sight of a home, and even when out of sight of the hunter, a home may not be out of range of his rifle bullet. Hunters have multiplied, the game area has become less, rifles have become more powerful, hence the dangers have been multiplied. Beginners in big-game hunting add to the danger. The perils would be greatly reduced if the hunter used a cartridge which was sufficient to meet the necessities of the case; if he exercised special precaution about shooting in the vicinity of houses, and if the manufacturers in their own interest advised hunters to use proper ammunition in settled communities.

JAMES C. MERRILL.

MAJOR JAMES CUSHING MERRILL, widely known as a surgeon, and as an ornithologist who has done much to reveal the secrets of bird life in the West and Southwest, died Oct. 27 at his home in Washington, D. C.

Dr. Merrill was born in Cambridge, Mass., graduated at Harvard, and received his medical degree from the University of Pennsylvania in 1874. Not long after this he was appointed assistant surgeon in the army and was stationed for many years at various posts on the Western frontier. During his service on the Texas-Mexican border, he made an extended study of the birds of the region, and introduced to the fauna of the United States a number of species never before found within our borders. Afterward, he was stationed for some years at Fort Klamath, in Oregon, and again at Fort Shaw, in Montana, and in both places devoted much time to the study of birds and published many interesting notes about the less known species. Later he served at Fort Reno in the Indian Territory—now Oklahoma—where he continued his work on bird life. For more than twenty years his name was a very familiar one in the annals of North American ornithological literature.

Dr. Merrill was also an ardent sportsman and big-game hunter. With the love of pursuit he combined the keen observation of the trained naturalist, and for this reason his writings on any subject connected with sport had an interest far deeper than commonly attaches to a mere narrative of adventure. His contributions to FOREST AND STREAM, and to some of the Boone and Crockett books are of extreme interest.

Personally Dr. Merrill was one of the most attractive of men, genial, kindly, hospitable, the very man one would desire for a companion in the home or in the field. He was modest to a fault concerning his own achievements, accurate in his scientific work, and stood in the front in his own profession.

After his many years' service on the plains and in the mountains, he was detailed as Librarian in the Surgeon General's Office in Washington, and there he has been for the past few years. The confinement did not altogether agree with him and of late his health had been unsatisfactory, yet we imagine the possibility of the fatal termination never occurred to his friends.

Among army men and among naturalists, Dr. Merrill had a wide circle of loving friends, by whom his loss will be deeply felt.

On Friday, Oct. 31, the New York Aquarium was formally transferred by the city to the New York Zoological Society. The transfer took place in the lecture room of the aquarium, and there were present a number of city officials and members of the board of managers of the Zoological Society. In a formal speech

Commissioner Wilcox, of the Park Department, turned over the Aquarium to the Zoological Society, and Prof. Henry Fairfield Osborn made an address accepting it. President Fornes, of the Board of Aldermen, congratulated the society on its new responsibilities, and the city on the excellent prospect of the aquarium under the new management. Mr. Chas. H. Townsend, the new director, made a brief address suggesting many of the possibilities of the institution as an adjunct to the educational work done in the city and as a place where scientific work could be carried on.

The Sportsman Tourist.

In the Faroe Islands.

After a fishing trip to one of the northern islands I am once more installed in Hans Kristoffer's little guest room in Midvag, resting from hard tramps across the mountains and enjoying the activity of other people. When I arrived, hay making was in full swing. Our household mustered a band of ten workers. Hans Kristoffer, Jegvand Senior, Jegvand Junior and our youngest, Heine, cut the grass and six stout girls turned and tossed it with their hands. Rakes are little used on a Faroe farm. I spent much time in the hay fields with the sheep dogs Frem and Heick sleeping by my side. Occasionally Hans Kristoffer or Jegvand Senior came and sharpened a scythe near by and we held such converse as my limited stock of Danish allowed. "Grind" was the subject of our last peaceful talk; grind—the "driving whales" of northern seas that in flocks of from fifty to 1,500 visit these fjords from time to time and are driven toward some bay and killed near shore. "Do you think there is any hope of my seeing the grind?" I asked Jegvand. "It may well be," he answered. "August is a good month, and Midvag has the best strand for the killing. If a flock is seen anywhere in these waters the boats will, if possible, drive it here. We shall know they have been sighted by the 'grinde-bud' [whale message] which will come either by land or by sending up a column of smoke from a headland on Stromöe, Hester or Kolter. The position of the smoke will tell us just where the flock is and where it is to be driven and then we send men and boats to help. Yes," added Jegvand, musingly, "it would be interesting for you to see the grind," and with brightening eyes he went on to tell of past killings and of the great one last year, when 1,500 whales met their death on Midvag strand. It must have been a dreadful sight; usually a flock numbers from fifty to three hundred, and even Jegvand admitted that 1,500 whales was an embarrassment of riches. And then the neglected hay making was resumed and I went back to the house.

Why should we have talked so much of grind that afternoon of all others? Was it a case of telepathy, some subtle connection between our group in the hay field and a messenger hurrying toward us from the fjelds on the north? I had just returned to my room and was standing by the window when I heard a rumor in the air, a suggestion of hoarse cries, and Jegvand Junior came dashing down from the hay field in flying leaps. Only one thing could make Jegvanhd jump like that—the *"grinde-bud!"* In a twinkling I was out of the house, but already Jegvand had seized his new grind dagger, belt and coat, and started on a run over the beach. As I stood there a dozen young fellows sprang past me, their eyes blazing with excitement; they were savages, pure and simple, for the time being, possessed with the love of killing, which lies in more or less latent form in every man's nature. The older men went on with their work in the fields; they could tell by the way the message came that only the young men were needed. In five minutes all were at the boats; then came a pause. The grind it seems were at Westmanhavn, ten miles to the north, and were safe for the present. The men of Westmanhavn had hemmed them in a narrow fjord and all they needed was help for the killing. So the young men returned to their homes to make fuller preparations, for it would be a two days' work. I lingered near to see what our Jegvands would be. A bottle of milk, a grind dagger, sheath and belt, an entire suit of sheepskin clothes to wear over his ordinary suit, a warm helmet hood and a good-sized wooden box filled with dried mutton, bones and all, and woolen stockings all mixed up together. Jegvand gathered up his possessions and stalked forth without saying "farvel" to a soul. Jegvand is usually very polite, but at that hour his eyes were fixed on a future full of grind and saw nothing this side of Westmanhavn. So he left us and for two days and nights no news came from the north; then he appeared, not having slept for fifty-four hours, and with a hand badly cut by a grind dagger. But they took the grind—one hundred and fifty in the Westmanhavn flock.

The second morning after the Midvag boats went to the hunt, a Sunday morning, the air was so still and warm that for the first time I had breakfast out of doors. There is a cosy nook in Han Kristoffer's garden sheltered from the sea winds by a grass-covered dike, currant and elderberry bushes. Within this inclosure grow sweet fern, cranesbill and saxifrage, and there I breakfasted and chatted with a sociable northern wren, a "mouse's brother," as the Faroe folk call him. I had shared my soft-boiled eggs and barley bread with him, and he was giving thanks in a burst of song, when suddenly from the beach close by an old man shouted "Grinde-bud!" The whale message had come again! The mouse's brother whisked away, and I sprang up on the dike and looked seaward where the man was pointing. There, three miles away, on a headland of Stromöe, a column of smoke rose high in the still air. It meant that the grind was in that neighborhood, and that all the men of Midvag who had not gone to Westhavn must come at once. Jegvand Senior had gone on cutting grass when the first message came, but this time it was not five minutes before I saw him hurrying over the strand like a boy of fifteen with a full killing outfit on his shoulders. In seven minutes from the first cry the first boat was at sea; a short enough time for eight men to gather with their outfit and launch a boat. Before half an hour had passed eight boats had put off, and that left not a single seaworthy craft in Midvag, and only small boys and great-grandfathers. Even our Heine, a slight lad of sixteen, had gone, though he had not been permitted to accompany eighteen-year-old Jegvand to Westmanhavn.

All the boats disappeared in the distance and nothing happened for four hours, except the arrival of men from Sôrvag and from Bó. When the cry had gone up from our beach, a man, "Grindebûdet," as he is called, had started on a run for Sórvag, four miles distant over the hills. When he came in sight he had shouted "Grinde-bud!" and another man had taken it up and run on to Bó, two miles and a half further on. In an incredibly short time the people arrived, breathless with the haste they had made. In little knots they lay on the grass by the shore, their daggers ready, waiting until their services would be needed, as the grind came to land. Far off at sea in a shining belt of water, I saw through my glass specks that proved to be boats in a long line. I saw nineteen, and there were more to come. Little by little thew drew near to Midvag strand, and in front of them now and then came a flash of silver as a whale spouted. "They are 'urolig'" (uneasy), said Fru Hans, anxiously. "They may yet get away!" and the Sórvag and Bó men began to get up and talk together seriously.

I ate a scrappy dinner standing at the window, opera glass in hand. At last six boats left the approaching line and came to land for stones, loaded up and put out again. That meant that the drive would soon begin, and I scurried off to the other side of the bay, where the flock must pass on its way to land. The boats drew nearer together until they almost touched, formed a semi-circle—forty-two there were by that time, and I could hear a sound like a great Indian pow-wow, hoarse shouts and cries and loud thumps and knockings on the gunwales to frighten the whales and keep them from rushing out to sea. The men threw stones fastened to ropes in the spaces between the boats and to right and left if the whales turned, and so slowly but steadily the flock was urged forward. An old man sitting near me said the boats would not charge in yet; the bay was still too wide, the water too deep, the whales could break away if frightened too soon. There seemed very few, to me, but "where there is one head seen above there will will be twenty below," said the man.

Then at last the signal was given, the boats dashed forward, the men shouting wildly, the grind was seized with a panic, and surged toward the land. A large flock of eider ducks, usually so fearless, became alarmed and made for the shore, looking over their shoulders and telling one another to hurry. There was a roar of surf on the beach, six great rollers preceded the grind and crashed along the coast, the grind dashed to the right and were met and turned by the boats, then to the left of the bay where I stood, and instinctively I began to climb higher. I could not see the drove from the storm of white water in front of it, but it struck the shore and two great whales upheaved by the pressure behind and below were cast high on the rocks at my feet; the boats closed in and the slaughter began.

Three hundred men fought with harpoons, hooks and daggers, and as the wounded and maddened whales broke from the harpoon lines and dashed on shore, they were met in the shallows by the men of Sórvag and of Bó, who, up to their arm pits in blood and water, struck again and again with their long daggers, and severed the spinal cord in the neck. With the first gush of blood all escape for the grind was at an end. Blinded, the whales swam helplessly to and fro, fighting only when wounded. Then they threw themselves about, lashing the boats with their great tails and dragging them forward to the shore. One immense whale hemmed in a boat close to the rocks and threw such quantities of bloody water over the men that they were helpless. It was like a huge red fountain, through which I could see now and then the blinded men trying to strike, but yet afraid of hurting one another. The boat was being beaten to pieces, and other boats had to hurry to their rescue. I saw boys six and seven years of age running into the water and stabbing with their small knives until plucked out and borne ashore by some old man who often returned to do a little killing of his own. One boat was sinking, but the men clambered into a neighboring boat and were taken to shore. Dignified Jegvand Senior was there, looking far less like a devil than most of the men, and I saw our Heine, as cool and collected as an old hand, striking to right and left with telling strokes.

In less than an hour all was over. Not one escaped. Two hundred and eighty-five whales lay dead and dying on Midvag strand, and from shore to shore the sea was red with blood.

Then the Sysselmand (or county sheriff) came to the front. Four men were appointed as assistants. The command was given for all the men to aid in dragging the carcasses as far toward land as possible, so they would be stranded by the ebbing tide. The assistants were to measure, value and mark them, and make a deep incision in the stomach so that the meat would keep fresh longer.

In the houses the women were hard at work. The grinde-bud had come just before the men had had their breakfasts. It was now 4 o'clock, and the men were tired out and half famished. Hans Kristoffer's house has a great reputation for hospitality, and he had more than his fair share of visitors. A grewsome looking set they were, dripping and bloody. Dozens of the least presentable were fed and cheered and dried in the outer kitchen or "rógstue" with its earthern floor. The dryer ones ate in the family living room. I would really like to know how many pots of coffee Fru Hans made in the next twenty hours. I know she was kept busy all night, and in fact no one slept in the house of Hans Kristoffer. The Sysselmand and his helpers were writing all night just outside my room, and men coming and going all night.

About 9 o'clock that evening I went down to the shore. Most of the whales were on land and others showed their sharp black fins and tails in the shallows. There were poor little baby whales born in the last agony of panic and of death, and lying by their mothers. The beach pools were pools of blood and on the strand the surf beat in a long crimson line.

Next morning when I went down again, the division had been made and boats were being rapidly loaded with the meat. The laws that govern the distribution of the grind are not to be comprehended by the average feminine mind. But I believe one-tenth goes to the Crown, one per cent. to the poor, one per cent. to the schools, the biggest whale to the boat that first reached the grind, a head to the person who first gave the alarm, the Sysselmand and his assistants have something for their labors, the pastor has his share, and after that all the inhabitants of a certain wide and large district share the rest, though those of a few far-away villages get but a half-share. I think the grind laws need revision. For instance, the capital, Thorshavn, with its 1,200 inhabitants, shares our grind at Midvag with those that have borne the brunt of the fight and keep open house to all afterward. On the beach that morning I met many of the Faroe men from other places, with whom I had tramped and fished and rowed—men from Sórvag and Bó, Leinum, Quivig and Westmanhavn, Thorshavn, Stromnoes and Saxon—even Myggenoes men appeared in the course of the day. They exchanged greetings over vertebræ and piles of blubber and rows of heads whose broad curving lips wore a queer smile. The air was heavy with the smell of fresh flesh, and a detailed description of the strand that morning would not be pleasant reading. All that day and all the next night the work went on, and our four men have just finished carrying up our share of meat to the lath-sided storehouse, there to be salted—most of it—and the rest to be cut in strips and hung from the house eaves to dry in the wind. It is two days now since the grind was killed, and yet the waters of the bay are still thick and red. Oh, for a strong breeze and tide to bring in fresh seas and purify us again!

The first morning after the killing, as I came out of my room, I found an official looking paper made out in mysterious terms with my name attached, and learned to my surprise that I also was entitled to a share of grind. I was much elated, and visions of wealth danced before my eyes. I was, it appeared, to have the equivalent of a tiny whale, and it was to be sold by auction. It did not seem honest, however, to appropriate a whale that I had not earned. But our Jegvand Junior had fought and bled and fought again, and Heine had come to the front nobly. I would give my whale to those who had been in the thick of the fray. So I did, and I can only hope I did it modestly, with no trace of conscious virtue. Young

AFTER THE GRIND-HUNT.
Faroe Islands.

A FLOCK OF GRINDWHALES.
Faroe Islands.

Jegvand seemed appreciative and thankful, but not, as it were, overwhelmed by the gift, and it occurred to me to ask the Sysselmand how much he thought it would bring. "Well," he said, "if prices had been high it might have brought four or five kroner, but people were nowadays buying much meat from the new whale station in Haldersvig, and I e supposed I'd get about 1.75 kroner for it." That would be, in American money, about twenty-four cents apiece. So ended my idea of being a Lady Bountiful to Jegvand and Heine.

I hear that our Midvag pastor was to have held communion service and a baptism at the next hamlet, Sandevaag. But the grinde-bud came just before church, and only women were left. He could not baptize the baby when the father and the six godfathers had stampeded, so he preached to the women and then set out for home. He reached Midvag in time to hurry up to the parsonage, get into his old clothes, seize his grind dagger, and climbing down the rocks to a boat just before the final charge was made, he was in the midst of the fight with eight of his flock.

ELIZABETH TAYLOR.

Pierre La Fontaine.

CONSIDERABLE interest has been recently manifested by sportsmen generally, even though their specialty be not big game, in the career of Pierre La Fontaine, the trapper and poacher, who in March last was wounded and captured by Maine game wardens and who, together with his friend Tom King, was subsequently erroneously reported, by Canadian papers, to have engaged in a fatal duel with his former captors.

Because of the long strides now being annually taken by civilization as impersonated by the settler—who contracts with his government for a few acres of timbered land, and in accordance with the terms of the contract immediately proceeds to alter its prehistoric nature—the edges of the woods are being felled on all sides, and the avocation of trapping, as well as the knowledge of woodcraft, is, as a consequence, being discouraged.

Since tales, and resulting dreams, of the inhabitants of the original vast forests and trackless plains have, since childhood, exerted an irresistible attraction and charm over us members of the human family who are not yet wholly civilized, it is entirely natural that the few remaining disciples of the Indians should appeal strongly to our sympathy. So, therefore, as a dweller of the woods and a legitimate bearer of the cognomen trapper, regardless of his personality and experiences, La Fontaine is an object of interest, outlined, as his class now is, against the setting sun of a period rife with stirring adventures and seeds of romance. Pierre La Fontaine, or, in plain English, Peter Fountain, was born in St. Francis, Canada, some forty-eight years ago of French-Canadian parents. Very frequently a strain of Indian blood circulates in the veins of these people, and such is suggested in this instance by La Fontaine's general appearance, he being six feet in height, swarthy, with straight black hair, dark eyes, high cheek bones and a large, loosely knitted frame which works all together, whenever he moves, like a perfectly adjusted, well-oiled machine. To see him lope through the woods, or handle a canoe paddle, is a delight. His eyes have such expressive power as to relieve the balance of his features from any display of feeling and a flash or a twinkle heralds a passing mood.

He began his acquaintance with the woods and its denizens in childhood, and, excepting a few years when engaged in mining near his native town, has spent seven or more months of every year in the wooded lands of Canada and Maine, trapping the several desirable fur-bearing animals and shooting the moose, caribou and deer, with a resulting satisfactory profit. Trapping is no sinecure, however, since it entails much hard work, long hours, some privations and almost constant exposure to the elements; therefore, although a trapper enjoys the excitement incident to his occupation and also an absolute freedom which only the lover of solitude can fully comprehend, still, he has much to contend with even before the abridgment of his license by game laws and the supplemental wardens. La Fontaine's camps were scattered through the forest in such manner as to afford a nightly shelter at the end of each day's long march. They were what are termed "fire camps," and so constructed of rough "splits" as to permit a fire and very little more room than was necessary to allow a man to lie prone before it—the one-sided roof being six feet at its highest point and sloping acutely to the ground. They and their meager equipment were invariably orderly and scrupulously neat, and this same regard for system is apparent in all his doings. A deserted hunter's camp will afford him opportunities for collecting and laying aside various odds and ends, possibly some provisions, which are carefully husbanded for the day of need, and after slaying an animal and preserving such parts as are valuable to him, he will carry the unused meat many miles to a logging camp, or to the home of a settler, rather than permit it to waste. His earnings are likewise well cared for, and he may sometimes be prevailed upon to make a loan, if the collateral security is strictly first class.

For fifteen of the thirty-five years this freeman has followed his inclination, the game wardens of Maine have endeavored to effect his capture, because the institution of protective laws failed to interrupt his pre-established traffic in peltry. He has, undoubtedly, annually violated the game laws of both Canada and Maine by killing game in close season, and also by taking a greater number of animals than is permitted; but nevertheless he is probably suspected of many delinquencies that are not his. For instance, he was said to have guided, from Maine into Canada, many deserters from the Northern army during the Civil War, which was quite a big contract for a boy of eleven years. Then again, when the stark body of an Indian was found suspended by the neck from a tree in the Maine woods, many years ago, La Fontaine's name was at once associated with the unpleasant experience of the deceased. And so on, down to the present day, when almost every carcass of an animal, found in the borderland of Maine and Canada, throws suspicion upon him.

On entering a game country, when hunting, his tongue, which in an emergency can discharge volleys of French and uncertain English, is silenced and all his faculties are focused upon the objects of his quest. He will travel hither and yon, among the probable resorts of game, until he discovers fresh signs and from these determines the number and movements of the animals; then, contrary to the precautionary measures of most hunters, he will pitch his camp in the immediate vicinity of their most frequented feeding grounds, and he rarely fails to get what he covets. He is fond of fishing, in a crude way, and usually has his hat band decorated with one or more flies, which he attaches to a sapling and dangles in the water. At times he will have a sink line, with baited hook in the other hand, and thus simultaneously engage both his sense of touch and sight. A captured trout will be yanked ashore without the courtesy of a landing net in true schoolboy style. Another of his pastimes and pleasures in the woods is to suddenly appear, Indian fashion, at the camp-fire of a hunter, and, in order to successfully accomplish a complete surprise, he will quit his bed at any hour of the night—sleep always awaiting his convenience.

La Fontaine has a good deal of humor and tells many stories of the following style at the expense of the hunters he has known:

"A sport he comed to me place one day an' he say,

PIERRE LA FONTAINE AND TOM KING.
La Fontaine is on the right of picture.

'Come ride away to hunt wid me,' an' I say 'Well, you go dug some patatties an' I gets ready.' When I come back he say, 'You tole me to dug patatties an' I dugged, an' dugged, an' dugged, an' dare ain't none dare!' Well, I goes an' looks an' he dug up all my raspberry bushes. Anoder man he comed in de winter time an' he says, 'I want a moose bad.' So I say, 'I know where dare is un track an' maybe we fin' him.' So we goes to de track an' I say, 'You take de gun an' go ahead after him.' He go maybe one mile an' he say, 'Where is de moose?' an' I say, 'Do you think him sit down an' wait fer you to come an' shood him?' He say, 'I didn't think a moose so strong to go so far; let him go on all der way?' So I say, 'You give me de gun an' you come after.' I go about four mile an' I broke de moose's laig; den I waited long time an' de man he comed an' kill him. Now, dat man be one great hunter what hav' killed a moose!"

La Fontaine's account of his final capture by the Maine wardens does not altogether agree with the published version of Warden Templeton. He was aware that his long-time pursuers were in northern Maine, but past success in eluding them—some of his devices being very ingenious and most interesting developments of woodcraft—made him venturesome even to recklessness, and he not only passed into the State, but by way of a logging camp which was tantamount to a publication of his presence and route. The new-fallen snow plainly exposed his trail, and although he partly concealed this, his fatigue was so great from drawing his sled load of provisions, that he went directly to one of his camps, neglecting entirely the most casual of his precautions against pursuit (the making of a long detour, and striking his own trail some distance back, in order to ascertain if other footprints had joined his) and fell asleep. A comparison of the recitals may prove entertaining, La Fontaine's English having been corrected:

The Warden's Story.

"We had heard pretty tough stories of Peter La Fontaine and decided to take as few chances as possible and make the arrest without any shooting, if we could do it. Shortly after 6 o'clock we decided to move, and did so with the greatest care, although the crunching of our snowshoes seemed to make a big noise. I was ahead, with Houston so close behind that he stepped into my tracks. I caught the latch of the door in my left hand, holding my revolver in the right. It was my plan to snap the door open quickly and, if I got a chance, to grab Peter before he had an opportunity to move. I was also prepared to do the other thing if forced to it.

"La Fontaine had evidently been lying on the floor on a bed of boughs and deer skins before the open fire, with his feet toward the door and his rifle at his head. At the snap of the latch he came to his knees as quickly as a cat, and that was his position when I caught the first sight of him in the dim firelight. At the same instant he brought his rifle around. I don't remember whether I said anything or not. If I did it was 'Don't you do it! Don't you do it!' But I distinctly remember watching the muzzle of that rifle as it flew around and just before it came in line with my body, I pulled on him."

La Fontaine's Story.

"I stood my rifle against the side of the camp, laid me down before the fire and fell asleep. I didn't hear the approach of the wardens, because the hearing of one of my ears is slightly defective. There was no door to my camp, but some pieces of splits were propped against the door frame, and when these were pushed aside by Warden Templeton, I awoke and as I raised myself, being only half-conscious, I dimly saw a man reaching out toward me as though about to place his hand upon my shoulder; then came a loud report and a pistol ball passed through by body. Warden Houston, thinking I had done the shooting, then crowded into the camp and was going to strike me on the head, when I said, 'Mr. Houston, if you please, I have had enough.' Then he was very kind, washed my wound, and bound it up to stop the flow of blood.

"I didn't find fault with the uncalled-for and unnecessary shooting, because Warden Templeton was afraid of me; but when I noticed that he then wore a pair of my moose shanks and drew them back from the fire so that I might not see them, I was mad, and I told him my opinion of him for taking to himself some of my property and some cartridges belonging to one of my hunting friends before burning my home camp and everything remaining in it that was not valuable to him."

It is an open question as to whether the Canadian Government is not, in a large measure, responsible for the incursions of poachers into the Maine woods, and surely that Government is wholly responsible for the slaughter of animals which are carefully nurtured by Maine's laws only to venture across the border. Canada has no wardens in the strip of country contiguous to northwestern Maine, which one man on the river might effectually patrol, and thus tacitly consents to "the fitting out of privateers to prey upon the commerce of a friendly State," as international law might express it. Last summer, two young men from Quebec visited the neighborhood under discussion, and, in the season when it is as easy to kill a moose as a neighbor's cow, slew seven of them and allowed them to rot where they fell. Although this fact is said to have been brought to the attention of the proper authorities, nothing has been done toward punishing the offense and incidentally discouraging such utter disregard of the game laws. Settlers nearest the scene of this depredation are entirely familiar with the laxity of the authorities; and why should they hesitate to take what game they want before young men from Quebec or elsewhere deprive them of an opportunity, and furthermore, if La Fontaine and others are not taught to respect the law at home, how can they be expected to have reverence for it when abroad?

LIPPINCOTT.

BALTIMORE, Oct. 29.

The Buck Duellist.

Mr. Jones Relates a Veracious Tale of the Adirondacks.

OLD Peletiah Jones, of Mud Pond, Essex county, N. Y., is a remnant of that picturesque body of men whose younger days were passed prospecting, hunting and fishing in the beautiful Adirondack country, and whose declining years are spent in guiding "city people" through the woodlands, by this means turning to good account the wood knowledge gained in pioneering.

Old "Pell," as he is familiarly called, is a pleasing contrast in many ways to the more modern young guide, who by association with rich and aristocratic campers is apt to have acquired a broad a and a discriminating taste for high-balls, rye and Scotch.

Pell wears the same clothing both summer and winter—always heavy-weight. Perhaps he lays aside his coat during the day, but he resumes it at night, and is always willing to sit near an open fire. He smokes a pipe stuffed with "Bobolink" or "Blue paper." When the pipeful is apparently smoked out, Pell stirs up the residuum with a knife blade, applies a light and manages a half-dozen or so additional puffs. This practice sometimes results in the firing of his pipe bowl, but since the odor therefrom is not very different from that of either of his favorite tobaccos, no harm results save that of shortening the life of the pipe. This is a minor consideration, since Pell is sole residuary legatee under the wills of annual departing campers, and bequests under these wills usually include numbers of pipes.

Pell has a collection almost as varied as that of a student at Heidelberg.

To kill a deer is quite as commonplace to Pell as the lighting of his pipe.

I remember one occasion when we had in camp with us a young gentleman from the city whose last ambition was to slay a deer by his own unaided efforts.

In different directions we had hunted all day long with no success. All had returned except Peletiah.

About 6 o'clock he came in, and greeting us, pulled from his pockets four or five small steaks and started to broil them over the fire.

Knowing old Pell, we initiated ones said nothing except to reply to his salute and remark that he'd been lucky again. The young fellow, however, was on fire.

"Did you really kill a deer, Mr. Jones?" he began, as he hovered over the fire.

"Guess I did," replied Pell, through the smoke.

"Well, when did you do it?" said the young man.

Pell absent-mindedly turned the steaks, intent on his cooking.

"I say, Mr. Jones," pursued the gnat, "when did you kill it? Tell me all about it. How far away did you shoot at it? How many times? Where did you hit him? Was it a male or a female?"

Pell peered up from his operations and regarded his inquisitor much as a big patient dog looks at a pestiferous puppy.

"Well," said the old man, "'twas a buck deer, and I was sittin' on a fawg near the end of the pond when I see him a-comin' acrost the lake. 'Peared to me I heered a dawg barkin', too. Anyways, I sot still and he come along. I waited fer him tell he got inter shaller water where I could git at him ter lug him out easy, and I shot him jist for'ard the shoulder."

"And how far away was he, Mr. Jones?"

"Oh, 'baout twenty feet," said Pell, "and if he'd 'a' come any closter I'd 'a' waited some more."

This story was so utterly at variance with the deer-hunting ideals set up for himself by the young man that thereafter "Mr. Jones" was a deposed idol.

Nothing but to cut down a fear-sped buck at three hundred yards could fill the desire of that young Nimrod.

Old Pell is something of a story-teller. Many an evening have we spent listening to his stories of the woods while the wind drew the sparks up into the night and we smoked post-prandial pipes.

Perhaps the following recital is a good example of his powers:

"'Twasn't many years ago," said our guide, "that your Uncle Pell had a pretty clost call for what life he had in his carkiss, and 'tain't every man kin say't he had the same chanct ter go straight to the golden city under the same circumstances."

Pell is an artist in his way, so at this point he stopped, relighted his pipe, puffed reflectively and waited for the usual, "Tell us about it, Pell."

Accepting our oblations, he continued:

"Well, it happened about this way. 'Twas gittin' along toward the middle of October, and me and Eb Lobb was campin' on the p'int yender in the slickest little tar-paper cabin that ever was built. We got the tar paper offen a waggin that got mired out on the Boreas River road. The young fellar that was teamin' gave it to us fer helpin' him out, and so not castin' away the gifts er Providence we kivered and lined our shack with it.

"One mornin' we woke up, and as it was Eb's turn ter do the breakfast cookin', he crawled out and begun fussin' 'round while I turned over fer jest a little wakin'-up snooze. I was dreamin' 'bout havin' been presented with a new .45-90 Winchester by grateful fr'en's I'd been guidin' through the woods, and I could see the printin' on the breech—'To Peletiah Jones, from his admirin' fr'en's,' with the names of them as had give it ter me underneath. Er course 'tain't no use namin' no names, but if I should tell yer the names, maybe ter git struck with a streak of lightnin' wouldn't surprise some of yer more."

I felt that Pell's eye would bore a hole in my head, but I couldn't bring myself to meet his gaze. Inasmuch as Pell collected some six or seven dollars a day—wages and tribute—more than some of us earned, my feeling was less one of guilt than embarrassment.

Pell finally withdrew his gimlet eye and went on:

"Well, right in the middle of my dream I was disturbed by loud noises and woke up, to hear the familiar voice of Eb cussin'. Eb kin cuss like a French-Canuck log driver, and them Canucks don't spend much time learnin' any other part of the langwidge, so that yer kin see 'twasn't egzackly like 'wakin' to the' songs of burds chuned ter sweetness,' as that Troy minister used ter say when he was campin' here.

"I kep' quiet, knowin' 't Eb'd make me the partner of his woes, and pretty soon he came a-stumpin' in with his light ax in one hand and a few pieces of chawed-up meat in t'other.

"'Huh,' says Eb. 'Breakfast!'

"'Sure,' sez I. 'I'm all ready fer it, so throw them red-flannen frog baits away and go out of the room till I take off my pejammies and get inter my clothes.'"

At this fine bit of sarcasm I raised my eyes and shot my deadliest look at him, but except for a slight twitching of the mouth, Uncle Pell's face was as placid as the lake of the same name on a windless day.

"'If yer kin make yer breakfast outer coffee and pertaters,' says Eb, 'well and good. Well and good,' sez he, 'but I'll be goldarned if there's a bit of venison in camp that's fit ter eat I've jest shown yer the hull of it," and he twiddled the meat rags on his fingers.

"'Catamount?' sez I.

"'Foxes,' sez he, 'and by the tracks I should think that the census fox would have saved himself a lot er walkin' if he could have been here when they c'mitted the robbery.'

"'Well,' sez I, gittin' up, 'tain't as though we couldn't get more, anyways try, and I hope your mind wasn't so upsot yer fergot to bile the pot.'

"'Oh, no,' sez Eb, 'the coffee pot's b'ilin',' and that mornin' was the first that year we went without meat—leastways durin' the open season," he hastened to add.

"We had ter have sumpin' ter eat, so Eb he stayed ter camp and I sot out ter see what I could find. Er course I hed my old single-shot rifle along and a good-sized horn-handled, stiff-bladed huntin' knife.

"My rheumatiz didn't let me git along any too lively, but perhaps that ain't so bad fer a still-hunter, fer it give me more time ter look inter fallen tree tops and brush then as if I was one er these here puff-zippin autymerbeels that young Platt's got down ter the village.

"Anyways I clim' along up and 'twasn't long 'fore I see sumpin' movin' in a little holler 'bout five rod off, and gittin' closter out jumped a buck that looked like a full brother ter Old Golden fer size and 'purtenances. He come down all right when I onhitched on him, and I went over tew him, leavin' my rifle leanin' up aside a tree near where I fired. Sumpin' I never did before ner since, but I felt so goldarned sure of that buck 't I didn't think er nothin' but just skinnin' him and luggin' a hindquarter back ter camp fer that overdue breakfast."

Pell threw back his head and laughed quietly.

"I was sumpin' of a bareback rider in my day," he went on, "but I never tried to ride on the under side of a horse with my legs hooked up over his back, so I couldn't give bein' outer practice as er excuse, but I want yer ter understand that when I straddled that buck as he was lyin' there kinder on his back, and put my knife point ter his throat, that when he got up, as he did, yer Uncle Pell jest clutched his legs around him and hung on.

"Er course he couldn't travel no Star P'inter gait with a hundred and sixty poun' draggin' on his keel, but he bumped me along pretty lively, till it 'curred ter me 'twas time I was makin' a little livelier move toward gittin' that breakfast. In the excitement I'd kep' the knife in my hand jest like a feller'll fall overboard outer a boat when he's spearin', and if he had his pipe in his mouth when he started, he'll most likely find it right in the same place when he comes up to the top. It's cur'us, but it's so. Anyways, I had that knife all right, and 'bout the first thing I did when I discovered it was to make a lunge at the old fellow's brisket with it. The p'int went in and I could feel on the haft 't I'd struck sumpin', and in a couple er jumps down he come, right er course er top er me.

"I crawled out f'm under, holding on to a hind leg in case of more surprises.

"It looked like he was dead enough now, er breathin' his last anyways, and right here I made another big mistake. Er course that up-ended ride give me a considerable shakin' up and I was a sweatin' some from it so I struck the knife inter the ground, butt up, and reached around to my hind pants' pocket ter git my handkercher to wipe off my perspirin' brow.

"I hadn't more'n straightened up with it in my hand 'fore that old devil give a snort like the Effin'ham's whistle down onto Schroon Lake and come to his feet like a circus performer turning a sumerset, all standin', head up and tail clinched tight.

"He didn't give me a chanst to even reach fer that knife, and it 'peared that my old red handkercher acted like a red rag tew a bull, fer the moment he seen it he come on me like a catamount, and knocked me flatter'n one of Marthy's pancakes, strikin' and hookin' savage. 'Bout this time I begun to realize 'twasn't so much a question of gettin' breakfast as 'twas of gettin' back ter camp for any meal at all, and any time. 'In other words,' as a long-winded lawyer cuss who camped here once uster say, 'In other words, I begun ter wake up ter the fact that I'd gotter fight ter keep my insurance from comin' due.'

"Well, we fit around there fer some minutes probably—seemed days ter me—the old buck a-strikin' and a-hookin', and I a-hangin' to his horns and tryin' to git away from those hoofs of his; but all the time I was tryin' ter work him around ter where the knife was, thinkin' if I could only get to it someways I could manage to spare a hand from his head and end the trouble. I had another hope, too, and that was he'd get weak from loss of blood, and perhaps give it up before I could get the knife or he'd played me out. The blood was comin' from his brisket cuts all right, and pretty good, too, I guess, but it didn't seem to make any difference ter him.

"All ter once I found we was gittin' nearer and nearer to the knife, and I quit pullin', only hangin' on.

"As soon's I did that I'll be goldarned if that old devil didn't drag me right over tew the knife, and I was jest gettin' ready to make my one-handed play fer it, when he raised his front right leg and come down onto that knife handle kerwallop, and when he raised up ag'in yer can call me a warm-water sucker if he didn't have that knife fixed onto his hoof as pretty as anything you ever see.

"Accident er not, yer can bet I was scared, fer it was sharp's a razor, and it give him 'bout eight inches more of strikin' reach, and he begun right away. Up went his sword arm and down she kim—slash—the hull of a boot leg gone, and a glancing cut on the ankle. He was goin' around on three legs, so's't he wouldn't lose the knife.

"It's all right ter stick to yer ship and go down with her, but I begun ter make up my mind 'twas better to desert and take my chance of being able to outfoot him to a young pine that stood 'bout six rods away. Ef he'd only insist on holding onto his weapon, I believed I c'd do it, fer I was Injun-built them days and c'd hoof it pretty lively, and if he'd go four-legged I thought perhaps he'd stick the knife inter the ground and git throwed.

"Er course it takes a derned sight longer to tell all them thoughts than it did to think 'em, and the fact of the bizness is that about two seconds after he give me the cuts I'd broke loose from my affectionate embrace and was strikin' out fer that pine.

"I've done my twenty and thirty miles a day a-walkin', and run six-mile an hour many a time and never thought about the distance or the gait, but there wasn't never no time in my hull life that a journey seemed so long or a place so hard to git to as it 'twas on the way to that pine. I c'd see it all right 'nough, but it looked more'n forty mile away, and 'bout as big as them fir trees that comes in a kid's Noah's Ark.

"When I started, his tail was p'intin' to the tree, and er course I was facin' it.

"Well, as soon as I let go I give his head a twitch to kinder daze him, and then I lit out. Natchully it took him a second or two to git the hang of things and git after me, but by that time yer Uncle Pell was under full steam, headin' fer the pine, and 'bout twenty feet in front of the enemy.

"I looked round to see how we were doin', and I couldn't help noticin' that he had that sword arm drawed up under him and was perceedin' on three legs.

"I guess there ain't any derned fool here but knows that a deer kin go 'bout as well on three legs as four, and it seemed ter me as though this one was goin' a leetle better'n most of them I'd seen crippled in one leg. Perhaps 'twas the peculiar circumstances made me feel so; however, he was comin', and what's more, was gainin'.

"I ain't 'shamed to say now that when I discovered that he was probably goin' ter git me that I was sceered, and sceered bad. I'd had a purty good shakin' up in the fust place a-ridin' him and a-tryin' time tusslin' him, and I wasn't in no shape fer even that short sprint. Besides that, the almost human action of the derned old cuss and the endurin' efforts he'd made ter kill me with the knife onsettled me, and helped to make me sceered.

"Well, I made up my mind 'twasn't no use a-lookin' round, but jist do m' best and trust to the Lord and my good trainin' and dig my toes in deep.

"Well, I done so, and as I got 'bout thirty feet from the tree, not feelin' his breath on m' neck, ner seemin' to hear his jumps, my hopes riz, and I twisted m' head around.

"Well, sir, yer can bet there wasn't no happier man in the world than I was that minit, when I seen that the old buck was on the ground with the blood pourin' from his wounds, and givin' them little kicks that always mean the end.

"I didn't slow up. I jest simply let go and down I come all in a heap. It didn't hardly seem real, and I lay there some time before I begun to realize that I'd been saved from a cruel and unusu'l death.

"I ain't much of a pray-er, but I give thanks fer my deliverance before I did another thing.

"'Well,' says I, to myself, as I got up, 'fer all 'pearances you are deader'n a last year's p'litical promise, but there ain't no power on earth that'll git me tew you 'til I'm fixed, so I jest give him a wide berth, and went back ter where I'd stood up my rifle, and then I come back at 'bout four rod and fired seven shots into the old cuss 'fore I had the nerve ter go up tew him.

"He certainly was a strappin' animal, and he had the knife in his hoof. It made me shiver tew look at it. I had ter work at it a long time before I c'd git it out, but I did, and finally got home with that breakfast."

The old man stopped short here, and knocking the burned tobacco dust from his pipe, refilled it from his pouch.

"Pell," said I, "why didn't you cut off that hoof which held the knife and either keep it or present it to some museum as a curiosity?"

"Huh!" replied Pell, "wouldn't nobody believe the story that went with it, would they?"

EDWARD SIDNEY RAWSON.

PORT RICHMOND, N. Y.

Advanced Ideas in Farming, Trapping and Woodcraft.

Number One.

WHAT most farmers lack is perception, the quality that enables one to adapt to one's uses and requirements those things that nature has especially provided—dear old Nature, who is always doing nice little things for farmers that are not half appreciated.

I realized this long before I first began the free, rugged and independent life of a hardy, honest tiller of the soil, and often resolved that if I ever had the chance I would do a lot of adapting, particularly in the way of utilizing such animals and birds as usually spent their time loafing around and beating the world out of a living. I became a tiller. The word tiller has two definitions, one of which is, a steering apparatus. I am just now classifying myself as the latter, one who steers. I am endeavoring to steer my brother tiller, the other kind of tiller, the one who in tilling the soil, from the shoals and rocks of those who defer decisive action till disaster has overwhelmed them. I am going to steer my fellow agriculturist and horticulturist and other fellow strugglers against the ruthless tide of curculio, potato bugs, cut worms, elm leaf beetles, seventeen-year cicada, brown-tailed moth, hob-nail grub, peach-leaf curl, pear-blight, bee-diarrhœa, hog cholera and a few million other little devices which dear old Nature contrives to make farming the exciting and absorbing occupation it is, the things that cause woe and alienation of friendship, divorces, murder, arson, undue encroachment upon neighbor's property, line fences and hen coops, and eventually the frequent kerflop from the noble, yea, godlike attributes of a farmer to the degradation of a member of State legislature or county commissioner. It is my purpose to steer him away from the rocks and rapids, the shoals and quicksands, into the broad and placid waters, the peaceful life of a money-making, respected agriculturist, compared to which, floating down a canal in a houseboat with nothing to do but eat boned turkey, diamond-back terrapin, chicken salad, lobster à la Newburg, drink iced milk punch and champagne frappé, smoke Perfecto cigars and peruse the pages of wisdom in FOREST AND STREAM, would be an experience of wildest excitement and peril.

I feel that I ought to do that much for my fellow toilers, my less fortunate countrymen of the same walk in life, and that is why I am going to do it. I don't want a cent for it. I should not accept any compensation if it were offered. I am not that kind of a philanthropist. There is not, if I do say it myself, a mean hair in my head, and I might add, not many of any kind.

Still, if there are those who feel that such disinterested and whole-souled service should not go altogether unrewarded, and in their gratitude should insist on sending to their benefactor a portion of the profits derived from Bohemian oats, seedless watermelons, perennial bearing rutabagas, short-weight butter and loaded wool fleeces, such persons can remit by New York draft or postoffice money orders; money sent in letters, if registered, will be at sender's risk, if not registered I will take the chances. Personal checks on country banks (except sand banks) will be received at par, but not credited until it is ascertained whether the drawer has overdrawn his account. When the returns are all in I will try to send to every grateful remitter a beautiful marriage certificate printed in four colors, with two doves and a game rooster in each corner, provided that six cents in postage stamps are inclosed to pay postage and for ordinary wear and tear. I wish to be plain and unostentatious about this matter, for if there is anything that I hate more than another it is an ostentatious tiller of the soil. The Lord knows he has little enough to be ostentatious about.

The way I came to run up against all my valuable experience was almost providential, yet logical, in fact, some might say it was pure fool luck; be that as it may, how much happier, better and wiser the world is for it. The tears come unbidden to my eyes when I think of it—especially when I think of that new variety of triple strength onions that I invented, and the time that I first tried cayenne pepper to kill lice on my flock of ostriches.

It was this way. My uncle and aunt made up their minds that they would let out their farm in the State of Kansas and go to Florida to engage in the manufacture of oranges and pineapples. When my uncle makes up his mind to do a thing, it is practically as good as done. I have excellent reason to remember this prominent trait in his character. While a youth I went to live with uncle, to attend district school, and incidentally do chores. I became impressed with the idea that a certain three-year-old colt, which was a part of the farm stock, could trot about fast enough to beat anything in the county of his age; bareback, welter-weight, free for all, three-quarter dash, hop, skip and jump, huckleberry rules, or any old way. I decided to surreptitiously drop in on the county fair—those annual events that my dear departed friend, Josh Billings, used to denominate "Agricultural Hoss Trots"—and do the boys up with neatness and despatch. I did so. That is I dropped in, and subsequently dropped out, likewise dropped my wad, and uncle dropped something when I returned home. I then realized the stern realities of life, and that what uncle said he would do he did, properly. That was a long time ago, and why dwell on these

themes that reawaken the echoes in the old woodshed?

Uncle had a right appreciation of his nephew, after all, and knowing that I had spent a term at our agricultural college, been secretary of one of the farmers' institutes one session, beside that experience at the county fair, he naturally selected me to come on and run the farm, while he and aunt should undertake to show the people of the sunny and fruity Southland how to do things.

"Sunny and fruity Southland." Say, how does that strike you? Rather neat, eh? Rather neater, perhaps, than veracious, especially when they have such winters as the past one.

I accepted the offer; two weeks thereafter our county paper, The Kansas Zephyr, published in the column devoted to our township, a "personal," which stated:

Our respected friends, Uncle Ephraim Downs, and his estimable wife, who have been subscribers to the Zephyr ere since it started, have gone to the balmy longitude of Florida, where they allow to engage in that beautiful and lukerative occupation of growing oranges and other tropicle fruits. Their newphew, Benjamin Coolidge, has been engaged to ruin the farm during their absence. Welcome to the county, Ben. Come and see us.

I did so at once, without unnecessary loss of time. I was ready for murder, rapine, massacre, gore, manslaughter, carnage, assassination or other form of homicide. "Engaged to ruin the farm!" Ha! I found the printing office at the head of a rickety flight of stairs and the editor sitting behind a cob pipe on top of an inverted soap box, evidently deep in the duties of editing.

"What do you mean by printing such a libel in your good-for-nothing, low-down sheet as that item concerning me?" pointing to the same in the paper which I held up before him.

"Libel! You! Why, my dear sir, w-what—where—let me see that—I wrote that myself—Uncle Downs—Shades of Great Scott! Why, gosh darn that drunken compositor, ef he hain't slid in a letter i into that word run—run the farm, that's what I wrote."

"Where is he? I'll sober him up! I'll just introduce the man that's going to ruin Uncle Downs' farm, and I'll commence by ruining one batch of old barleycorn seed right now."

"Oh, he's gone—he's lit out; he had a spell or two of the serpents Sunday and Monday and I fired him; fired Sam Gale to take him over into Poseytown in his delivery wagon."

"Then you've missed a first-class tragedy item for next week's paper."

That editor proved to be the finest kind of a chap, one of these brainy, broad gauge, intellectual giants and appreciative journalists that one sometimes runs across unexpectedly. I am not saying this because he fell in with my ideas of farming and raising stock, and wanted me to conduct a column in the Zephyr on "The Highest Type of Modern Farming," and let me name my own terms. Not at all. Not by any means. In fact, far from it. It was a most noble act. The fact that money and price were no object to the editor, because he never paid anybody for anything (which I afterward discovered), had absolutely nothing to do with the proposition. Anybody could see that.

A few weeks later the columns of the Zephyr contained the following:

BRAINS IN FARMING.

Probably no recent event has had so much to do with the prospective development of our lovely county, and so fully illustrates the possibilities of our soil and climate under brainy management, as the success of experiments already made by Benjamin Coolidge on his uncle's farm. His entirely original methods with crops as well as in making ordinarily useless animals earn their living, and a little more besides, is certainly interesting and more or less instructive; generally more. We congratulate the entire county on having this kind of a man in our midst. It might be suggestive to add that he's the only man so far that has paid his subscription to this paper in cash. Go thou and do likewise.

The particular events and innovations to which the gifted editor refers will be set forth in another chapter or two. FRANK HEYWOOD.

[TO BE CONTINUED.]

On the War Road.

"THIS is the War Road," was the somewhat startling announcement that glared down on me from a board nailed high upon a poplar tree on the edge of the woods.

The few scattered wagon tracks which I had been following across the half-brush, half-prairie lands further back, concentrated here, and passing between two trees that just grazed the hubs on either hand, wound away into the unknown wilderness beyond. The sign board was of rough, unhewn lumber. The lettering had been done with red chalk. The marks showed only here and there, and the general effect, somehow, was one of awkward splashes in blood.

The letters had much in their appearance to suggest a disordered mob fleeing before a victorious army. They leaned this way and that, and straggled in and out of line. The "t" and "e" in the "the" towered far above the cowering little "h" between them, and might have passed for two stalwart fellows dragging away a wounded comrade. It was ominous.

I had learned at the last settler's cabin, half a mile back, that after entering the wilderness proper I should see no sign of human habitation until I returned. There was a possibility that I might meet somewhere on the way a miner returning from the Rainy Lake gold fields, and another that I might find a few Indians in camp at the mouth of the War Road; but the probability was that I should see nobody on the whole trip.

I was in search of solitude. For three days I had been traversing a sparsely settled country, having followed the old Saint Paul and Pembina trail from the neighborhood of Crookston, Minnesota, north to where it crosses the Roseau trail. Over this I had reached Roseau, a small village seventy miles back in the wilderness. Another half-day without sight of a house had brought me into camp at night rejoicing in my escape beyond the dread of aught that could remind me of civilized abominations. But I had only begun to hug myself when I positively stiffened with dismay. A cow bawled, and the illusion was destroyed.

A few minutes later two children came along, driving the cattle. Other sounds presently told me that I was within two hundred yards of a farmhouse.

This was annoying, as I wanted to enjoy the night and the moonlight alone. But my annoyance was somewhat intensified when, half an hour later, the farmer and his family called upon me, staying until twelve o'clock and drawing from me my life history by inches. Here was solitude with a vengeance, and I resolved to put as many miles as possible between me and the haunts of man before I again undertook to commune with Nature in her loneliest retreats.

About five miles east of Roseau (Jadis, it was then) I passed the last settler's cabin, and half a mile on I came face to face with the grewsome legend:

"This is the War Road."

It was ten o'clock when I faced this tunnel, bored through thirty-five miles of unbroken solitude, with a slight fracture only at one end. I began to wonder if I had not better go back and camp near the settler's cabin—so as to be handy to water—and take an early start in the morning. Then I might be sure of getting through before nightfall.

I began to think that solitude might be like some other good things—deleterious when taken in overdoses. It was useless to try to make myself believe that I should turn because of water for that night's camp. I knew that creeks, lakes and muskegs were everywhere in the wood. Therefore, if I adopted this retrograde move I must admit, to myself at least, that I stood in awe of that vast solitude. That I would not do. There was no valid reason for retreat, and giving Jack and Jill their marching orders, we plunged into that mysterious stillness.

I gave myself some courage by the assurance that, if any good reason occurred to me in the meantime, I could still turn back after going a few miles into the wood. For awhile the road led through a swamp, and as the whiffletrees and hubs of the wagon began to disturb the bushes along the way, out swarmed mosquitoes in clouds. Or, I might say, in a haze at first, which thickened and darkened until it assumed the blackness of a thunder-cloud. This was something I had not thought of, and I accounted it a good and sufficient reason for waiting to make the trip for some day when the wind should blow hard enough to keep down mosquitoes.

There were other things I had not thought of, however. One was the narrowness of the way, closely walled in by standing timber, fallen logs and underbrush. It was impossible to turn, and I should have to keep on at least until I reached more open ground. When at length I came to an opening, it was a bog crossed by a narrow corduroy road, and the chances for turning were not improved.

A couple of miles further on the road came out on firmer soil. Poplar, birch and willow gave way to great oaks, whose branches, interlacing, completely shut out the rays of the sun. An impenetrable tangle of fallen limbs, brush, vines and brambles continued to wall me in and to keep me in this "straight and narrow way," and before I did come to a possible turning point the wind sprang up from the east, sifting into the faces of myself and the mules, like a rush of air through a cañon, and sweeping the mosquitoes to the rear. With them went my excuse for turning at all, and I kept on.

The road had been cut through only about wo months before and was very rough. There had been little travel over it. The larger growth had been cleared away wide enough only to admit the passage of a wagon, while the small brush still stood. Nothing could be seen of the track ahead, and one had an impression of traveling through an accidental opening in the wood. The noise of the wagon as we bumped along, was so great that there was little prospect of catching a dryad unawares, though I confess that I kept a sharp lookout and several times imagined I caught a glimpse of one as she whisked out of sight behind some great oak.

The wagon creaked and groaned direfully as it bumped over the stumps and roots or plunged hub-deep into ruts. There was always a deep rut opposite each stump, as, when the wheel raised over a stump, it threw the whole weight of the wagon on the opposite wheel, forcing it deep into the soft mould. This kept it rolling and pitching at a great rate, and the steady swish of the small brush bent beneath the axles resembled the hiss of water beneath a storm-tossed boat.

Occasionally a partridge hopped from the road in front of the mules and alighting on some bush just ahead, out of reach, eyed me curiously as I passed. My Parker lay in its case at the bottom of the wagon; I cared little for the game, and no one being present to witness my prowess, I had slight incentive to shoot. I did try a few shots at the partridge, however, with my whip, but the lash usually caught in an overhanging bough, and I scored nothing but clean misses.

Friend, did you ever make a wagon journey through a forest or after dark, when objects could be seen only for a short distance? If so, do you remember how swiftly you seemed borne along, yet how interminable seemed the way to some momentarily expected destination? How the seconds swelled into minutes and the minutes into hours, as you swept on and on; yet how you remained, seemingly, always in the same spot?

After I had been in the woods, as I judged, for two hours, I began to speculate on the distance I had traveled. At the rate the sibilant bushes brushed past beneath the wagon I must be going at least six miles an hour. Twice six are twelve; whole distance to be traveled, thirty-five miles. Clearly, I was more than one-third of the way; but rather than be disappointed at the end, I would reduce my calculations and call that great oak, there, on the left, the quarter-post. By giving good measure thus, I should get a rebate on the last quarter, just when I needed it.

It is customary when writing of the woods to expatiate on their grandeur. But I was still under the spell of that ominous guide-board; and though the solemn forest shades did fill me with awe, the scenery was a good deal like that inside a railway tunnel, except that the walls were composed of whispering green leaves and yielding boughs, and not cold, gray, unyielding and voiceless granite.

Two hours later I note a tree with a wagon-hub blaze, which I call the half-way mark. Soon afterward I see an opening ahead and wonder if I can possibly be coming to the lake. Perhaps I have allowed too much, and in place of getting a present of the last quarter the rebate is to be nearly the whole last half of the journey. The light spreads; it is plain that I am nearing the end of the tunnel. It is impossible that I can have come thirty-five miles. I begin to wonder if the contractor who cut the road has not "done" the government—if he has not been paid for thirty-five miles when the actual distance is twenty. But no; the opening is not the lake, but a wide muskeg with a burned district beyond.

Crossing the muskeg on a pole bridge, the road winds away across the burning on a long, low sand ridge. The way is now much smoother and my range of vision more extended. I am on one of the well-defined sand-reefs characteristic of northwestern Minnesota. These ridges are one of the great natural curiosities of this region. Flat, curving reefs of sand, one to two hundred yards wide, they are continuous for many miles. Being gravelly and well-drained, their spines make splendid natural roadways.

Travelers in the old fur-trading days took advantage of these ridges in laying out their highways. The old Saint Paul and Pembina trail follows them for more than a hundred miles; the Roseau road hugs another for more than two-thirds of its seventy-one miles of length. But for this ridge the eastern half of Kittson County would be still unsettled. The streams that have their sources in the Red Lake basin cut these ridges at right angles, the deep, gash-like channels having the appearance of breaks in a great dike. The wide valley of the Roseau breaks the continuity of the Roseau road ridge; but it is said that it is this same ridge which the War Road traverses all the way to the Lake of the Woods.

With smoother roads, a more extended prospect and a fresh breeze, my spirits rise and I roll along at a brisk trot. On the ridge top the sway of the fire had been complete and everything had gone down before it, except here and there a charred stump or tree trunk. Some of these reached a height of fifty or sixty feet; all were blackened to the very top. These, with a two years' growth of poplars, were all that remained of a once dense forest.

On either side of the ridge stretched a great swamp which had not burned, and tamarac, spruce, cedar and balsam pine reared a variegated screen of pale and deep greens and purple. I was now enjoying myself thoroughly and took slight heed of the flight of time, until it suddenly dawned on me that another two hours had slipped away. I must be entering on the last quarter stretch, and if I was to get much of a rebate the lake should soon appear. Mile after mile I glide through the prattling green poplars, but no lake materializes. The tamarac and cedar of the swamps give place to birch and willow, with now and then stately white pine, but along the ridge are the same charred stumps and fluttering poplars.

Another two hours slips away—still no lake. I have been guessing at time and rate of speed, but with all the allowance I have made I surely cannot be far short. I eagerly watch each new opening, expecting momentarily to catch the glimmer of water through the trees.

I begin to have some misgiving about reaching the lake at all that night, but promptly administer a stern rebuke to myself upon reflecting that solitude, with a big S, is what I have been looking for. How one could revel in a vast and mighty ocean of solitude by camping overnight in this lonely wood! I fall to speculating on what there is beyond the portal of that great swamp, off there to the north. Moose, doubtless, and bear and deer. And, as if conjured up by an over-active fancy, a great lumbering hulk swings into the road ahead of me!

It is a sure-enough moose, no apparition. And, by the glaring sign board of the War Road, what a spread of horns! Like the fish that got away, I think him the finest specimen I ever saw. He gazes at me for a full half minute; then turns and shambles off into the poplars. Ah! if only I had had one of those long-range cameras—one with a trigger, that is aimed like a gun and that, if the aim be true, catches the victim full in the center of the disk. I remember to have seen such a one, on paper (Harper's Weekly), some years ago, and have often wondered why they were not brought out. What a boon such a gun would be to the sportsman! He might shoot and shoot to his heart's content, then, and no effeminate "woud-be" could shout "Game hog," either.

For an hour my imagination is at a wire edge. I have just evoluted the fourth black stump into a bear, and then, upon closer inspection, back into a stump again, when it occurs to me that the lake is still missing. It cannot be that I am off the road, for there is but one road, and I could not turn off from it if I tried. I now begin to examine into my calculations. I have been for ten hours in the woods. A brief reckoning shows that it should be sundown, whereas the sun is at least four hours high. Calculations that are four hours out in ten seem worthless as a basis. I conclude I am in the woods, and drop it at that.

Three hours later I come to the crossing of War Road River. Then I remember that this crossing is six miles from the lake. The deep, dark waters have an inviting look as they swirl and eddy beneath the overhanging trees. I am tempted to go into camp and wet a line, but the buzz of mosquitoes warns me to seek higher ground before halting for the night. A couple of miles further on I come to a high knoll with a large open stretch of grass at the top. In the center of this miniature park, where the wind has a free sweep, I conclude to camp.

Unharnessing the mules, I tie them to convenient bushes, giving them as much rope as possible in order that they may reach abundant grass. Then I collect some dry limbs and build a fire.

Preparations for supper are of the simplest, being limited to fetching and boiling some water for coffee. My provisions consist mainly of canned goods ready for the table. To be sure I might have had a pheasant to broil had I been so minded, but riding in a wagon

all day is not exercise to whet one's appetite for broiled pheasant. On canoe trips, where the exercise is violent, I usually live largely on broiled meats, but when traveling overland in warm weather prepared foods with fruits are more suitable.

A small rill a short distance back on the trail furnishes the water. It is soon at the boiling point, and carefully measuring out a handful of ground coffee I put it in the pot. Then, to make my calculations sure, I pour in a stream from the sack. This mode of making a cinch of a good thing I learned from a friend with whom I used to hunt ducks in the old muzzleloading days. He used a very heavy ten-gauge gun, and his unvarying load of black powder was "Six drams and a stream."

Supper is soon over. The things are cleared away and I unlimber my hunting trunk, take out and set up my gold medal cot and spread my blankets on it. I am aware that in all well-conditioned stories of camp life the first thing after supper one should light his pipe, but truth has a stronger hold on me than custom, and I am compelled to own that I had no pipe. I had resolved not to pitch the tent but to sleep in the open air. This still further extended the idle time usually filled in with smoke and stories, between supper and bed.

As I had neither pipe nor companion, I passed a part of the interim by taking my gun from its case and assembling it ready for use. Just why I should have done so on this night more than on any other is a mystery to this day.

On what slender threads of chance have depended some of the greatest events in history! A random thought gave birth to Thanatopsis. But for the mere incident of Isaac Newton taking his nooning under an apple tree, water would still be running up hill; in which case, what of our duck marshes?

Had I been a lover of weed and brought my pipe along, the stirring events of this night might not have occurred.

If some drifting fancy had not put it into my head to assemble my gun, how different might have been the termination of my adventure!

I have just laid the gun across the foot of my cot and started to replenish the fire, when my attention is attracted by one of the mules. He has backed away from the bush to which he is tied, as far as the rope will permit, and is sitting on his haunches, snorting and trembling with terror.

Picking up the gun again, I slip a couple of target shells into it and walk in the direction the mule's ears point to see what has startled him. The sun has been down for some little while; a full moon has climbed well above the eastern horizon. The long, pointed shadow of a lone pine is just beginning to make itself discernible across the glade, while from the deeper gloom of the dense forest down in a valley to the north comes the insistent cry of a whip-poor-will. The day, which has been oppressive, has given way to a beautiful night, the wind in the poplar leaves produces a soothing cadence; but from the way in which Jack surges on his rope and snorts, he is evidently not taking much notice of this.

What can it be? At first I can discern nothing as I look across the glade and scan the bushes closely along the opposite side. But a rustling in the wild-pea vines just in front of me causes me to glance in that direction. Though I never saw a panther in my life, one glance at that long, lithe body and swaying tail told at once the nature of our visitor.

I was as well acquainted with him then as if I had associated with him for years. It is astonishing how familiar one becomes with birds and animals one has never seen through the magic of good black ink. Here was a gentleman, a perfect stranger, yet his countenance and every move were as well known to me as if I had lived next-door neighbor to him all my life. Aside from this recognition, I knew just what to expect from him. I had not read the "Leather Stocking" and like tales in vain.

Though the gun I held in my hand, a light twelve-gauge Parker, had always been regarded by me as a toy rather than as a defensive weapon, and I had some misgiving on that score, I was perfectly sure of myself. My nerves, which usually become unstrung on the slightest provocation, were steady as the solid earth beneath me. I never went to score to shoot a mud pie, even for fun, without being more or less flustered; but here I was face to face with an animal that has sent a thrill of terror to the hearts of the bravest and most renowned hunters, yet I was as unmoved as a lighthouse.

I remember all the tales I have ever heard of the ferocity of this beast as I get into position and stand at ready, waiting for the bird to fly. It will be a one-bird race, thirty-foot rise, privilege of both barrels. And the stakes are high—a mule and a man on the on hand and the life of an individual who practically owns the earth on the other. A vast difference, to be sure; and the bird certain to be an incomer. Think of this regal creature laying his life against mine. He whose day has been one continual round of conquest, who has never for a moment known thrall, whose sleek coat has never become frayed or worn and whose suspender buttons have never flown off at critical times; whose every want has been supplied without effort other than that we of the meaner clay call sport; whose every movement has been free and untrammeled; and whose inheritance, compared to that of a Gould, is as the universe to the atom. Think, I say, of this prince of creation playing all this against my miserable existence!

Against such a royal hazard I could only place my life of gradgrind and eternal thraldom, a life never since boyhood free for an instant from the shadow of want and unrealized ambition. No matter how far I may wander into the wilderness, in the feeble effort to imitate the life of my noble adversary, the chains that bind me to the needs and customs of man are ever clanking behind me. I have tried to shake them off and be like him, but all in vain; the stream cannot rise higher than its source. He is the true sportsman, I the imitator. He has never slain, simply to boast of his achievements to his fellows later on. He never hunts for the pot. Neither has he committed any acts of vandalism, but has taken Nature as he found it, fresh from the hand of the Creator, admired it and left it so.

All these things his feeble imitators do. They kill what they do not want that they may boast. Then they grow jealous of each other's boasting and make rules to regulate their killing, then counter rules; until they are tangled up in a network of rules and flounder about like flies in molasses, each madly jealous of the others:

> "We have a passion, make a law
> Too false to guide us or control;
> And for the law itself we fight
> In bitterness of soul."

I had reasoned the matter out on these lines and was about to thrown down my gun and capitulate to my superior, when it occurred to me that I had not taken the mules into my calculations. They were slaves, of course, like myself, and wearing the shackles of civilized life, but entitled to some consideration in striking a balance.

I had not decided in my own mind which were the worthier, three slaves or a free man, when my calculations were brought to an end by the bird taking wing. This stampeded all reasoning; brute instinct took the floor and won out in favor of me and the mules.

Flat as a shingle, straight at my throat, the panther sailed through the air, his mouth wide open and his hot breath singeing my flowing beard to a charred stubble. Yet, with my chest thrown out, my eye hard and disdainful as a cold chisel, like a minor peak of the Rocky Mountains, I awaited his frightful onslaught. Truth compels me to add, however, that there is one slight speck upon the perfect picture I have drawn—I felt a trifle in doubt as to the efficacy of my three drams of Dupont Smokeless and No. 7 shot.

Holding my fire until he had passed the meridian of his flight and was sweeping down upon me like a meteor, I aimed at his throat just between the nether jaws and pressed the trigger. Though I had decided on no plan of action, the second barrel followed the first so quickly that both charges entered the animal's gullet at the same spot, making a hole little larger than the bore of the gun.

The shock of the discharges turned the beast a complete somersault, and he landed squarely on his back with his tail between my feet. Had not the force of the shot checked his impetus, he would have been a "dead out"; as it was I scored, though by a very close margin. Panthers are easy when you meet them in the right way.

I don't know how the fin-de-siècle sportsman might view it, but I made the best argument I could to myself in favor of myself and dropped the subject, after which I roused up and began to prepare my cot for sleep.

Dreaming, did you say? No; I had just been telling myself a story to pass away the evening.

THE PARSON.

Natural History.

Seaboard Air Line.—VIII.

To Nov. 1, 1902.

By May 25 our northern patrons had passed along, and with many of our summer regulars for company, we started the season of 1902.

Vegetation was backward, owing to the lagging spring weather; hence much nest-building that usually develops unseen, was patent to the eyes of any who cared to give even a passing glance in faring along our highways.

In general, we had many hundred more of our native residents who bred and sported and sang for us than in many years. A pair of cardinals located nearby about the middle of August, and practically all day long the inspiring slogan of the male rang from the treetops, now here, now there, as the shy creatures stole about in successful endeavor to avoid the scrutiny of the passer-by, whose curiosity was aroused by the clear accents of these "artful dodgers." Like the evasive voice of our yellow-breasted chat, the cardinal's whistle is an uncertain quantity to reckon with in locating the bird, as it possesses the same ventriloquial power—though to a less extent than that our "chatt-y" friend who loves to poke about the bushes and low shrubbery. Aug. 25, crystal clear skies, with a light air from N. by E.; was a marked day in our orderly routine of summer bird business. At 10 A. M., while revelling in the glorious harmony of the outside world, there came a peculiar "h-i-ss" of wings that awakened boyhood memories with a sudden surge that brought me to my feet with the mental cry of "wild pigeons." Low down, just clearing the treetops, my startled eyes caught the swift, graceful, onward sweep, the old-time formation in close order, the clipping wing stroke of a huge flock of—wild doves (*Z. carolinensis* (L.)). There were at least 150 of them, where bound—they flew N.E.—or how so many of them came in company I cannot say. Never have I seen more than seven or eight together in this locality before, the usual appearing of this bird having been in pairs, or, at most, in little companies. Old timers who read these notes will sympathize with me in my momentary excitement, for who among them can ever forget that sibilant sound of filling all the air of dawn in the days of long ago, when the wild pigeons boomed along overhead. This peculiar swish or hiss of wings was as much an accompaniment of the flight of the "vanished race" as the whistle of an up-springing woodcock is an inseparable accompaniment in all mental pictures of days afield in pursuit of this also fast vanishing game bird. Science recognizes two minds in the man: the objective and the subjective. They tell us "the subjective mind never forgets an impression once received," so I have to thank my subjective mind for that renewal of impulse, for that sudden start as the sibilant rush of wings overhead brought back in one vivid moment—a far cry from the past—the living, moving reality of the long "vanished race."

During all the fine days we were favored with in September, the mosquito hawks were prevalent, in fact, unusually so, often on clear days with northerly winds, at an immense height in the clear sky, above the low-lying blue haze of bituminous coal smoke, that always drifts over us from the city when the wind is in the N. Two woodcock only this season; there may have been more, but I can vouch for two only—July 15 and again Oct. 7—poor lonely chicks, soon they will also be "back numbers." Our annual flight of hawks was a general affair, a scattered passing from Sept. 19 to Oct. 2, owing to prevailing N. and E. winds and a generally upset state of weather conditions.

During the past few weeks of gorgeous autumn days, big fellows, little fellows, in bright, and again in modest attire of dun, russet and gray, have traveled along melodiously, both by night and day. To-day, while the sunlight is playing in glowing color on the fast changing foliage, the distant squall of a belated bluejay serves to emphasize the departure of our feathered friends, while again and again the call of passing bluebirds, themselves unseen—a part of the cloudless sky—tempers the chill silence of the outside world.

WILMOT TOWNSEND.

A Silver Tip Family.

A sketch contributed to "Trail and Camp Fire," one of the "Books of the Boone and Crockett Club."

MOST of my hunting of grizzlies was in the Big Horn Mountains, in 1880, 1881, 1882 and 1883, at a time when they were not much disturbed, and had not as yet adopted what I understand is now a common habit, of feeding almost exclusively at night. A favorite custom of mine was to ride to a hill or point overlooking a good deal of hillside and forest margin, picket my hunting pony, and with a good field glass to watch such game as might appear; and in those days it was seldom that some animals were not in sight—buffalo, elk, white tail or mule deer, antelope, sheep and black or silver tip bears—according to the locality. As a rule, I preferred to watch rather than to hunt, unless an unusually fine head or the need of meat in camp was an incentive to kill. Of the game seen none was more interesting than the silver tip, and with one family I became quite well acquainted.

While on a fishing trip in June, camp was made on a fine trout stream where I passed several days, fishing a little and incidentally looking over the country with a view to returning in October for a fall hunt. Near by was a divide, open for a mile or more and then covered with pines, surrounded on two sides of its triangle by small cañons. Regularly each afternoon about four o'clock, a large female silver tip with two cubs would appear from the woods and work over the ground, sometimes till dark. Occasionally a larger bear, probably a male, would appear, but did not join the others, who seemed to be rather afraid of him. I may mention that on one occasion three mule deer crossed the slope a little below the bears, so that I had the unusual experience of having four bears and three deer in the field of the glass at one time.

The chief occupation of the bears while in sight was turning over stones in search of insects beneath, and it was most interesting to watch their methods. A man turning over a stone usually draws it over directly toward himself, to the imminent danger of his toes; but a bear knows better than that. In the case of a heavy stone, they would brace themselves with one foreleg and with the other raise the stone and give it an outward sweep well to one side, so that it would not strike them in falling. The moment the stone was over their heads went down, and they apparently licked up such insects as were in sight, though I was not near enough actually to see this. Then usually one or two rapid sweeps of a paw were made, probably to uncover such insects as might have secreted themselves. One of the cubs would sometimes join the mother in this search, but generally each worked independently. Imitating their mode of search, I have found many beetles and ants, and numbers of mole crickets, and of the large stone cricket (*Anabrus*). In this place, at least, dead stumps were rarely searched.

The habit of turning over stones is very general in the spring and early summer, and was one of the best indications of the presence of bears; later in the season, wild plums and other fruits are more generally sought as food. This family of bears were regular in their habits, feeding from early morning till about nine o'clock, and reappearing about four in the afternoon. On cloudy or showery days they might be seen at intervals all day, but a hard rain they avoided. The female, while watchful, was not at all shy. She happened to be in sight when the tents were pitched, a process she watched with much apparent interest and some surprise. At first she brought her cubs in close to her; but before long they resumed their search for insects, and finding they were not molested, paid little more attention to us. When watching an object she would raise herself to her full height on her forelegs and elevate the head, which was moved slowly from side to side, giving her a rather uncanny look of mingled watchfulness and waggishness; at such times she appeared to be making up her mind whether to sneak off, to charge, or to dance! This is a common attitude, and one I have frequently observed when hunting. The effect is of a pretty direct line from nose to rump in contrast with the usual outline of the bear on all fours, where the shoulders are highest and the head and rump lowest. This attitude has something comical about it, and when seen assures the hunter that the animal is alert.

I watched this interesting family for about a week, and left them undisturbed until autumn. At that time bears were plentiful. In the same month and near the same place I saw eleven in one day, two black and nine silver tips, which I think was not far from the usual relative abundance of the two species in the Big Horn Mountains fifteen and twenty years ago.

I remember these incidents more distinctly than others that occurred to me. Unfortunately, in those days I thought, with many others, that game would continue in abundance much longer than proved to be the case, and so neglected to preserve many notes and specimens that to-day would be of very great interest.

J. C. MERRILL.

The Serpent's Tongue.

Editor Forest and Stream:

In my dissertation on the rattlesnake I omitted one significant item of my observation, which is, that there seems to be a strong suggestion of a degree of sensitiveness in the tongue that enables the snake to discern the nature of objects without getting in contact with them. The tongue appears to be an important organ in all snakes, and is brought into play with great frequency when curiosity is excited. It is never brought into contact with any object of inquiry so far as I have observed, and I believe must have sensorial functions that we know nothing about.

Sensational writers about rattlesnakes all give prominence to the eye and its effect on observers. The eye is in reality small and inconspicuous. I have found some difficulty in getting a clear view of it at short range; it is a dull yellowish color, with a vertical slit for pupil, overshadowed by a prominence above, and, like aquatic reptiles, they are well advanced toward the nose end.

There is also much said about the strong odor of rattlesnakes, which I believe to be wholly imaginary. They may give off an odor at certain times and under certain conditions, perhaps, but with a somewhat intimate association with a number of specimens I have never perceived any odor, though my olfactories are quite sensitive.

The young squirrel is building a nest in a broken jug, and robs my desk of the tissue paper I use for pen wipers.

COAHOMA.

[There is in the first volume of the *Woodcraft Magazine* an interesting article on this subject by the well-known naturalist, W. H. Hudson, whose observations agree with those of our correspondent. Hudson writes:

"Doubtless those who invented this use for the organ were misled by observing snakes in captivity, in the glass cases or cages in which it is usual to keep them; observing them in such conditions, it was easy to fall into the mistake, since the serpent, when moving, is frequently seen to thrust his tongue against the ostructing glass. It should be remembered that glass is glass, a substance that does not exist in nature; that a long and sometimes painful experience is necessary before even the most intelligent among the lower animals are brought to understand its character; and, finally, that the delicate, sensitive tongue comes against it for the same reason that the fly buzzes and the confined wild bird dashes itself against it in their efforts to escape. In a state of nature, when the snake is approached, whether by its prey or by some large animal, the tongue is obtruded; again, when it is cautiously progressing through the herbage, even when unalarmed, the tongue is exserted at frequent intervals; but I can say, after a long experience of snakes, that the exserted organ never touches earth, or rock, or leaf, or anything whatsoever, consequently that it is not a tactile organ."

Nor, he adds, does the structure of the tongue give support to the supposition that the organ can be sensitive to "an emanation from an object which might in some unknown way convey to the brain its character, whether animate or inanimate, cold or warm blooded, bird, beast, or reptile, also its size, etc." Two uses are suggested for the extruded tongue, one that it serves as a warning, and another that it is a lure; and the reasons which give ground for these theories are set forth at length in a record of the author's field observations.]

Wild Animals of the North.

From Richardson's "Fauna Boreali-Americana; or the Zoology of the Northern Parts of British America."

WHAT we in America call elk, was commonly called by the Hudson's Bay people of early days, red deer, on account of its resemblance to the European red deer, which, however, it exceeds in size. Richardson places the northern limit of this animal at 56° or 57° parallel of latitude, and says that it is not found to the eastward of the line drawn from the south end of Lake Winnipeg to the Saskatchewan. He adds that to the south of Lake Winnipeg it may perhaps extend further to the eastward. Of course it is well known that in old times it did extend far to the eastward, and the species was probably found occasionally in Michigan and Wisconsin, up to about 1870, and perhaps casually somewhat later. He reports that two male wapitis were found near Edmonton-house lying dead, with their horns locked into each other. But, indeed, the range of the elk was quite to the southward of most of Richardson's journeyings.

This, also, is true of the mule deer, which he mentions only to say that he has not seen specimens. He mentions as a variety of the mule deer one called Columbian, which is known to be quite a different species.

The white-tailed deer was also rather out of Richardson's line of travel. He quotes Douglas as to some of its habits, and says that the native tribes call these deer by means of blowing into a hollow tube, which produces a sound like the animal's voice. With such a tube, "aided by the head and horns of a full-grown buck, which the hunter carries with him as a decoy, and which he moves backward and forward among the long grass, alternately feigning the voice with the tube, the unsuspecting animal is attracted within a few yards in the hope of finding its partner, when, instantly springing up, the hunter plants an arrow in his object."

The antelope's range, too, was chiefly south of the country traversed by Richardson, who gives its northerly limit as about latitude 53°, and calls them merely summer visitors to the north branch of the Saskatchewan. "They come every year to the neighborhood of Carlton-house, when the snow has mostly gone. Soon after their arrival the females drop their young, and they retire to the southward again in the autumn, as soon as the snow begins to fall. Almost every year a small herd lingers on a piece of rising ground not far from Carlton-house, until the snow has become too deep on the plains to permit them to travel over them. Few or none of that herd, however, survive until the spring, as they are persecuted by the wolves during the whole winter."

It is known that in recent times, in severe weather, there is a great migration of antelope to the north down into the valley of Milk River, and in past years hundreds have been butchered there in most disgraceful fashion.

Richardson says that the Mandans, on the Missouri, are said to capture antelope in pounds, and it is sufficiently well known that this was formerly done by certain tribes west of the Rocky Mountains, as well as by other tribes of the plains.

One of the early descriptions of the white goat, though of course, by no means nearly the earliest, is given by Richardson, with a figure which shows admirably some of its characteristics, but gives no notion whatever of its form or appearance. The artist has drawn a high-headed, alert animal, which is as different as possible from the actual mountain goat, and whatever account Richardson gives of its habits is borrowed from others.

Neither did Richardson know much about the mountain sheep, though Mr. Drummond met with them and reported that, "In the retired parts of the mountains, where hunters had seldom penetrated, he found no difficulty in approaching the Rocky Mountain sheep, which there exhibited the simplicity of character so remarkable in the domestic species; but that where they had been often fired at, they were exceedingly wild, alarmed their companions on the approach of danger by a hissing noise, and scaled the rocks with a speed and agility that baffled pursuit. He lost several that he had mortally wounded by their retiring to die among the secluded precipices. Their favorite feeding places are grassy knolls, skirted by craggy rocks, to which they can retreat when pursued by dogs or wolves. They are accustomed to pay daily visits to certain caves in the mountains that are encrusted with a saline efflorescence, of which they are fond. The same gentleman mentions that the horns of the old rams attain a size so enormous and curve so much forward and downward, that they effectually prevent the animal from feeding on level ground. The flesh of the Rocky Mountain sheep is stated by Mr. Drummond and others, who have fed on it, to be quite delicious when it is in season, far superior to that of any of the deer species which frequent the same quarter, and even exceeding in flavor the finest English mutton."

Richardson's remarks on the buffalo are, in part, devoted to quotations concerning the earlier history of the buffalo, but are still very interesting as giving dates of extermination in certain portions of the East, and also as giving the northward distribution of the species which we now know as wood bison. He says, "Warden mentions that at no very distant date herds of them existed in the western parts of Pennsylvania; and that as late as the year 1766 they were pretty numerous in Kentucky; but they have gradually retired before the white population, and are now, he says, rarely seen to the south of the Ohio, or on the east side of the Mississippi. They still exist, however, in vast numbers in Louisiana, roaming in countless herds over the prairies that are watered by the Arkansas, Platte, Missouri and upper branches of the Saskatchewan and Peace rivers. Great Slave Lake, in latitude 60°, was at one time the northern boundary of their range; but of late years, according to the testimony of the natives, they have taken possession of the flat limestone district of Slave Point, on the north side of that lake, and have wandered to the vicinity of Great Marten Lake, in latitude 63° or 64°. As far as I have been able to ascertain, the limestone and sandstone formations lying between the great Rocky Mountain ridge and the lower eastern chain of primitive rocks, are the only districts in the fur countries that are frequented by the bison. In these comparatively level tracts there is much prairie land, on which they find good grass in the summer, and also many marshes overgrown with bulrushes and carices, which supply them with winter food. Salt springs and lakes abound on the confines of the limestone, and there are several well-known salt-licks where bison are sure to be found at all seasons of the year. They do not frequent any of the districts formed of primitive rocks, and the limits of their range to the eastward within the Hudson Bay Co.'s territories may be nearly correctly marked on the map by a line commencing in longitude 97° on the Red River which flows into the south end of Lake Winnipeg, crossing the Saskatchewan to the westward of Basquiau Hill, and running from thence by the Athapescow to the east end of Great Slave Lake. Their migrations to the westward were formerly limited by the Rocky Mountain range, and they are still unknown in New Caledonia and on the shores of the Pacific to the north of the Columbia River; but of late years they have found out a passage across the mountains near the sources of the Saskatchewan, and their numbers to the westward are said to be annually increasing. In 1806, when Lewis and Clark crossed the mountains at the head of the Missouri, bison skins were an important article of traffic between the inhabitants on the east side and the natives to the westward. Further to the southward, in New Mexico and California, the bison appears to be numerous on both sides of the Rocky Mountain chain.

"The bison wander constantly from place to place, either from being disturbed by hunters or in quest of food. They are much attracted by the soft tender grass which springs up after a fire has spread over the prairie. In winter they scrape away the snow with their feet t oreach the grass. The bulls and cows live in separate herds for the greatest part of the year, but at all seasons one or two old bulls usually accompany a large herd of cows. In the rutting season the males fight against each other with great fury, and at that period it is very dangerous to approach them. The bison is, however, in general, a shy animal, and takes to flight instantly on winding an enemy, which the acuteness of its sense of smell enables it to do from a great distance. They are less wary when they are assembled together in numbers, and will then often blindly follow their leaders, regardless of, or trampling down the hunters posted in their way. It is dangerous for the hunter to show himself after having wounded one, for it will pursue him, and although its gait may appear heavy and awkward, it will have no great difficulty in overtaking the fleetest runner. While I resided at Carlton-house, an accident of this kind occurred. Mr. Finnan McDonald, one of the Hudson's Bay Co.'s clerks, was descending the Saskatchewan in a boat, and one evening having pitched his tent for the night, he went out in the dusk to look for game. It had become nearly dark when he fired at a bison bull, which was galloping over a small eminence, and as he was hastening forward to see if his shot had taken effect, the wounded beast made a rush at him. He had the presence of mind to seize the animal by the long hair on its forehead as it struck him on the side with its horn, and being a remarkably tall and powerful man, a struggle ensued, which continued until his wrist was severely sprained and his arm was rendered powerless; he then fell, and after receiving two or three blows became senseless. Shortly afterward he was found by his companions lying bathed in blood, being gored in several places, and the bison was couched beside him, apparently waiting to renew the attack had he shown any signs of life. Mr. McDonald recovered from the immediate effects of the injuries he received, but died a few months afterward. Many other instances might be mentioned of the tenaciousness with which this animal pursues its revenge, and I have been told of a hunter having been detained for many hours in a tree by an old bull which had taken its post below to watch him. When it contends with a dog, it strikes violently with its forefeet, and in that way proves more than a match for an English bulldog. The favorite Indian method of killing the bison is by riding up to the fattest of the herd on horseback and shooting it with an arrow. When a large party of hunters are engaged in this way on an extensive plain, the spectacle is very imposing, and the young men have many opportunities of displaying their skill and agility. The horses appear to enjoy the sport as much as their riders, and are very active in eluding the attack of the animal, should it turn on its pursuer. The most generally practiced plan, however, of shooting the bison, is by crawling toward them from the leeward and in favorable places great numbers are taken in pounds. When the bison runs it leans very much to, first, one side for a short space of time, and then to the other, and so on, alternately.

"The flesh of a bison in good condition is very juicy and well flavored, much resembling that of well-fed beef. The tongue is reckoned a delicacy, and may be cured so as to surpass in flavor the tongue of an English cow. The hump of flesh covering the long spinous processes of the first dorsal vertebræ is much esteemed. It is named *bos* by the Canadian voyagers, and *wig* by the Orkney men in the service of the Hudson's Bay Co. The wig has a fine grain, and when salted and cut transversely it is almost as rich and tender as the tongue. The fine wool which clothes the bison renders its skin when properly dressed an excellent blanket; and they are valued so highly that a good one sells for three or four pounds in Canada, where they are used as wrappers by those who travel over the snow in carioles. The wool has been manufactured in England into a remarkably fine and beautiful cloth, and in the colony of Osnaboyna, on the Red River, a warm and durable coarse cloth is formed of it. Much of the pemmican used by the voyagers attached to the fur companies is made of bison meat procured at their posts on the Red River and Saskatchewan. One bison cow in good condition furnishes dried meat and fat enough to make a bag of pemmican weighing 90 pounds. The bison which frequent the woody parts of the country form smaller herds than those which roam over the plains, but are said to be individually of a greater size."

The Sellick Moose.

MONCTON, N. B., Oct. 27.—*Editor Forest and Stream:* Moncton is a town of 12,000 inhabitants, surrounded by good hunting woods for partridges and moose. Several parties have killed moose thirty miles outside of town limits. One party, Mr. W. F. Humphrey, M. P. P., left here at 10:30 A. M. and returned with his moose next day by 3 o'clock. The carcass was in the market by that time.

The farmers about this district complain bitterly of the deer, and occasionally moose, destroying their crops. This summer I was starting on a fishing expedition, and I was not more than three miles from the town in the adjoining county of Albert, when I saw a deer grazing in the field along the road with horses and cows; he was there when we left. Houses not more than 200 yards distant, with men working near at hand.

We have here a hunter, Sellick by name, who has four or five moose in captivity. They are inclosed in a large block of woodland fenced, and the animals have logs about six feet long attached to a rope around their necks, which prevents their escaping. An hour's drive brought me to his place. Sellick went a short distance in the woods with me, cautioned me to keep out of sight, and called his large bull moose, who answered the call at once. Sellick put a halter on his head and tied him to a tree. While this was going on he was perfectly quiet, but the moment I put in appearance the scene was changed. It was with great difficulty Sellick could control him—in fact, he ordered me to get out of sight after a very few minutes.

I believe Sellick has sold two calves in the States, realizing good prices.

J. W. P.

Separation.

From the volume of poems entitled "Tangled in Stars," by Ethelwyn Wetherald.

He went upon a journey
And she was left at home;
And yet 'twas he who stayed behind,
And she that far did roam.

For though he went by mountain
And wood and stream and sea,
A little cot enwrapt in green
He saw perpetually.

And she within the green leaves,
Not knowing that he stood
Forever by her, dreamed her way
With him by mount and wood.

Now heaven help these lovers,
And bring her safely home,
Or lead him back along the track
Where she, e'en now, doth roam.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

No. 4.—A Handy Combination Grub-Box and Table.

THE novice at camping is often puzzled over the problem of how to carry his perishable provisions while on his way to camp, and what to do for a table when he arrives and makes ready for a meal. To an old hand these questions are easily answered, and he prepares for every need ere he leaves home. But while a few minutes' time and work will provide a serviceable table in the permanent camp, if one knows how to go about it, one who camps only now and then for two or three days, naturally casts about for something that will be efficient yet simple, and at the same time serve two purposes, at least. Canoeists have hit upon something that will do this, in the combination grub box and table, and a description of it may give the beginner a fair idea of a box that serves as boat seat, supply kit, dinner table, and a handy place to lay things on at night, when the ground is damp.

When kerosene vapor stoves came into general use among canoeists, they realized the advantages of eating meals inside their tents when mosquitoes were annoying

THE COMBINATION GRUB-BOX AND TABLE.

outside, or during a rainstorm. Of course, it was awkward to do this when a temporary table had been prepared from bits of plank or boards, picked up on the beach, and perhaps this suggested the combination table and grub-box, which can be picked up bodily during a meal, if need arises, and moved into the tent or elsewhere, and this, too, without removing any of the contents of the box or whatever may be on the table at the time. This is possible when the legs are in place and the lid locked in a horizontal direction by means of a brace underneath. These articles are made in various shapes, but as their size is generally much alike, a description of one of them will answer as a guide for any novice at camping who may wish to make one for his use. The inside measurements of this box are: Length, 16 inches; width, 15 inches; depth, 8 inches; depth of lid, 1 inch; length of legs, 18 inches; dimensions of separate board, 16x8x¼ inches; thickness of ends, ⅜ of an inch; of sides, top and bottom, ¼ of an inch; legs, 1¼x ⅜ of an inch.

By referring to the illustration of this table, a very good idea of its form and appearance may be obtained. It is shown in Figure 3. Figure 1 shows one of the four brass pieces into which the legs are fitted temporarily, and Figure 2 shows the brace rod of the lid and one of the brass pieces into which the brace rod fits. The wood of which this table is made is red cedar, but white pine will be found more durable. The sides are fastened to the ends with brass screws ⅞ of an inch long, and the top and bottom are fastened with ¾-inch screws. To insure perfect fitting of lid and box, the whole should be finished as a covered box. Then, with a very thin saw, the box should be sawed through one inch from the top, and when this is finished, the edges should be smoothed off slightly with sandpaper, otherwise it will be difficult to fit the lid neatly. Two brass strap hinges are then attached to box and lid at one end, and a brass staple and strap placed in the center of the opposite end. Flat-head brass screws ⅜ of an inch long will hold these attachments. A small padlock may be added, or a bit of pine, tapered, will serve to keep the strap in its place over the staple. A staple riveted on a plate will be best.

To make the pieces for holding the legs, get some soft brass 1¼ inches in width and 1-16 of an inch thick. Cut four pieces, each about 4½ inches long. These should be bent to shape, as shown in Fig. 1. This can be done very easily in a vise, by hammering. Care should be taken to mark the brass where it is to be bent, so that all the angles will be sharp, and the width of each loop the same, as otherwise each leg must be fitted separately when the brass pieces are in place on the box. When the screw holes have been bored in the brass, it it attached quite near the bottom of an end of the box, and an angle sufficient to permit the leg to extend outward, as, if all the legs were made perpendicular, they would afford little stability to the table when resting on soft ground, and frequent capsizes of the outfit would be the result. When the four brass pieces are in place, the legs should be fitted into them, and each leg provided with a shoulder, so that it will not push further through than necessary. Then set the whole on an even surface and mark the bottom of each leg, sawing it off so that it will rest evenly on a floor. When this is done, the table will be quite rigid, for so small an affair, when set on soft ground.

Take two pieces of brass, each an inch wide and three inches long, the thickness being about 1-32 of an inch. Lay one across the vise, first opening it about ¼ of an inch. Take a 3-16-inch steel drill, or a wire nail, and place it across the brass, parallel with and over the opened jaws of the vise, then hammer the drill until it forms a loop across the bit of brass like that shown in A, Fig. 2. A few raps with a hammer will do this. Then bore three holes in each end of the strip, and treat the second one in a similar manner. Place one of these brass strips near the bottom of the box, on the end carrying the hinges, and the other strip on top of the lid, near the edge and just above the hasp. Now turn the lid back until it is in a horizontal position, and measure exactly the distance between these two strips of brass. Then take a piece of hard brass wire about 3-16 of an inch thick and place it in the vise, letting one end stick up a trifle more than an inch. Hammer this end until it forms a right angle, try it in one of the strips and see if it fits nicely, then bend the other end likewise, until the finished rod resembled B, Fig. 2. If this rod is of the correct length when inserted in the loops in the two strips, it will hold the lid-table as rigidly as if it were nailed in that position.

The separate board—shown under the vapor stove in the picture—fits into one end of the box when not in use. Behind the match box will be seen a tiny strip of wood. On this and a corresponding strip on the other side of the box the board rests during a meal, then is

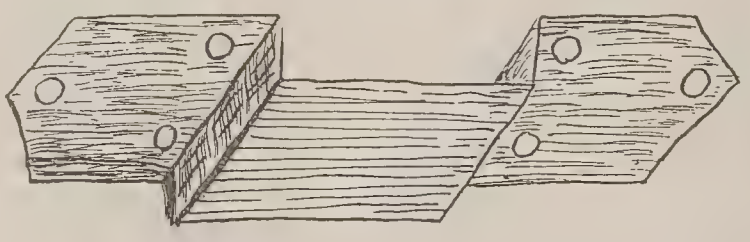

Figure 1.

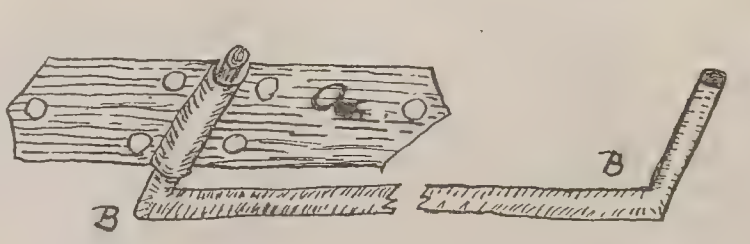

Figure 2.

replaced in its groove in the end, as mentioned above, where it also serves to strengthen the lid when the box is used as a seat in the boat. By this means the space that may be used as a table is nearly one and one-half times the size of the box. For carrying handles, two holes may be bored in either side and bits of cord tied in these. If a small ax is carried, it may be safely stowed away in the box by tacking a bit of leather on one side and pushing the blade into this pocket, as shown in the picture.

If care is exercised in selecting the cooking outfit, it may be stowed in the box and abundant space left for provisions. In the box pictured here, a gallon kettle occupies one corner. In another the following articles are nested: An asbestos plate, three aluminum plates, a frying-pan with detachable handle, four saucepans, the coffee pot, two cups, salt and pepper shakers and a teaball for coffee. Then there is a deep tin can holding spoons, knives, forks, a small whetstone, etc. The other articles are in a tin box containing coffee, one for sugar, one for matches, a screw-top butter jar, and other small stuff. Some of these nest in the large kettle, but there is sufficient space left for bread, eggs and the usual supplies for two persons for two days, while the legs and lid-brace lie across the contents under the lid. The vapor stove and its supply of wood alcohol and kerosene are carried in a tin sugar box, in which there is also sufficient space for sundry supplies in tins or jars. When the two boxes are filled, there are supplies for several days. As it is often desirable to cumber the tent with as few articles as circumstances will permit, the table may be left outside at night, with the lid closed. With this end in view, it is well, in finishing the box, to give it two coats of linseed oil and two of good spar varnish, so that it may be left out in the rain without fear of injuring it or its contents.

Some of these boxes have been made of thicker material than the one described, but this is not necessary if white pine or red cedar is used. For larger ones however, it is well to make the ends of half-inch boards and the sides three-eighths. As the average decked canoe will not accommodate a much larger box, sixteen or seventeen inches seems to be the size generally made. In stowing the box is placed in the after end of the cockpit and used for a seat.

PERRY D. FRAZER.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Captain Bill and his Crew.

EARLY in October I found a letter on my desk from Mr. Mershon, of Saginaw, notifying me that his car would pass through St. Paul on Oct. 7, en route for Dawson, N. D., and to be surely on hand to meet the boys, as when the day rolled around the car and all on board were there. Beside Capt. Bill were Major Lyon and Mr. Humphreys (hobbling with a cane, yet as game and enthusiastic as any of the party), Messrs. Davis, Jed Averill, Briggs, Morley and Mr. Seib.

For over ten years to my own personal knowledge this car and this same party, with slight changes from year to year, have been making this same trip. Poor Bill Schultz has shot his last mallard, for eighteen months ago he joined the legions of mighty hunters who have already crossed the silent river to the land of the shadowy brook and the golden prairie.

Although every nook and hidden corner of the car was replete with drawers and lockers, and although every man on the car had perhaps figured over his wants a dozen times and found nothing wanting, yet for the short time they were in town before starting for the north, nothing must do but that they saunter over to the gun store of Burkhardt's, and when they got there and looked around—strange to say they, every man, found he needed something. The way they swooped down on vests and shooting jackets and caps and other things was a caution. Jed, intending to continue out toward the coast and do some timber prospecting, bought a Mauser pistol, light to carry and yet powerful enough to lay low a Roosevelt cat.

By train time we were all back at the depot, and found our car hitched on to the end of the Northern Pacific train. Ten successive years have I been invited on this trip, and I have yet to make it. Always something to prevent that final action of slamming down the lid of one's roller-top desk and just going.

Before the "all aboard" signal was given, Capt. Bill turned the key in the door and said he: "What would happen were we to just carry you along? We have plenty of shells, an extra gun or two, an extra sleeping bag, a vacant berth in the car and plenty of provisions—so what's to hinder your being shanghaied? What would happen?" I pleaded my case, and the court reluctantly discharged me, and on my part I very regretfully and longingly followed the glimming rear lights of that train as it whisked away, perhaps the best and jolliest party of gentlemen sportsmen that ever threw a fly or aimed a gun. I got away from my captors by promising to run up to Dawson and spend a day with them before they returned, but Kansas City and Chicago called me hence, and the opportunity was again taken from me.

Saturday last, the 18th, the following wire from Dawson reached me:

"Leave Dawson eleven fifty to-night; need a roast and a turkey and oysters. W. B. MERSHON.

That telegram was simply eloquent. Like the British who in Hogarth's time were stationed on the Continent, they longed for the good roast beef of old England.

Here these boys had put in ten solid days upon the Dawson prairies, interlarding a strictly game diet of the canvasbacks, mallards and redheads, with prairie chicken scattered here and there, and now and then in desperation indulging in local steaks and roasts of a presumably dubious character. And now that their faces were turning toward home, they longed and prayed for oysters, for a turkey or roast beef!

In my early days, after knocking about on the road, through Iowa, from one hotel to another, where fried steaks and sausage and cakes were the standbys, how I have longed for the sight of a grill room where one might go and ordering a sirloin or a chop, actually sit there and see it spurt and sizzle over the glowing coals. And I knew how that poor game-surfeited crowd felt, and I sighed for them, and when their train rolled in yesterday at 2:15 P. M., a messenger handed over the finest lot of oysters and the plumpest and juiciest roast that the market afforded.

What a happy crowd they were! Everybody exuberant in his praise of the shooting and general good time had by them all. Geese there were none, the lakes north being yet open, but chickens and sharptail grouse and ducks as well, they found them, and in abundance. The days were bright and the air was bracing, and their mornings and evenings were given up to ducks, and between times they followed the elusive grouse and wary chicken. Their early shooting had educated the chickens up to club

together, merging or consolidating for mutual protection, so much so that in one case they saw a flock of fully five hundred in one stubble field, and the old cock birds waited for neither dog nor man, but sailed away when danger neared.

The first good batch of chickens, thirty-three in all, were picked and cleaned, and were hung on the rear of the car to drain and cool, and lo and behold when the chef went to bring them in to put in the cooler, all but eight had been filched by the crew of a passing freight train.

The division superintendent was informed of the theft by wire, and the matter was investigated and no doubt the culprits located, but no redress or relief was offered, because, as explained by the official, were he to discharge that crew, they would go right up to St. Paul and order a strike on the whole system. And thus was cold comfort handed out to Capt. Bill and his crew.

Well, I took my boy with me and turned him loose in the car. He soon had it well surveyed, from one end to the other, from kitchen to bath room. And then he came to the lockers where the guns were kept, and Mr. Mershon took his own Scott 16-gauge out and turned it over to the boy to study out, and when the boy got through "breaking" the gun and snapping the locks and aiming it at pigeons flying along the tracks, he handed it back to Mr. Mershon and turning to me said: "Pa, are you not going to take me hunting some day?" And then Capt. Bill jumped out of his chair. "What's that?" said he. "Never have taken that boy shooting! What's these yarns then you have been writing to the FOREST AND STREAM about 'Taking your boy hunting'?" And then he drew a long breath and started in again: "When I read your article I gave you all the credit possible, because I believed every word you wrote, and here I have you face to face with the boy and I find you have been stuffing the FOREST AND STREAM readers." And Capt. Bill said a lot more that would hurt my credit with the readers of the FOREST AND STREAM were I to repeat. It's up to me now to make good, and that boy before I am twenty-four hours older will have a 16-gauge gun and some shells, and he'll go shooting if I must turn him over to Sam Fullerton to take him. After this I will quit shooting birds with my lead pencil and keep down to facts. One such checking up as Capt. Bill gave me should last a man a lifetime.

Well, after the car had been switched down the yards to be iced and watered, we left the car and wended our way toward the Sherry or Delmonico's of this town, Carling's (previously putting the boy on the trolley car for home), and securing a snug corner, we sat down to supper. The first call was for oysters, Humphrey and Morley scorning anything less than a straight dozen each, and while the oysters were opening, we fished for the sunken cherry with our oyster forks and made up the order, which was simply straight steaks, extra sirloins and double porterhouses, with fixings—and what a sight it was to see those bronzed, hearty and healthy men enjoy their dinner. Morley, unacquainted with the laws of Minnesota, and because of a taste left in his mouth for game, ordered a broiled quail, but the virtuous indignation of the colored waiter, Charles, broke forth in a look of righteous scorn, and Morley got no quail.

Lord, but it was good to spend an hour with your feet under the mahogany with such a crowd. Every man brimful of fun and rife with anecdotes. We missed good old Jed. They said Jed did all things well until he hit the poker chips each night, and the pounding he got, he said, made him feel much like a local duck traveling from slough to slough on Sunday with every farmer's boy within miles pounding him with a "Zulu." One night Jed had a full house or a royal flush or something, and pulled 35 cents out of the bank at quitting, which went far toward restoring him his nerve and self-esteem.

There were some gray heads in the party, and if one might judge from appearances other than the gray hairs, they are the youngest of the party. Long live the Saginaw boys, and may the Fates hold them together and good Dame Fortune grant them many such trips as they have just had, is the wish of

CHARLES CRISTADORO.

The Saginaw Crowd.

THE twentieth annual hunting trip of the Saginaw Crowd was described by Mr. W. B. Mershon in the Saginaw Courier-Herald, from which we copy as below, for the Saginaw chronicles belong in FOREST AND STREAM:

You have asked me to tell the readers of The Courier-Herald something about Dakota shooting, and the recent trip of the Saginaw party. I have not time to comply with your request fittingly, but briefly would state that this year was the twentieth annual trip of the Saginaw Crowd to North Dakota. The first trip was made in our old hunting car, "City of Saginaw," in 1883, which was the year the Northern Pacific was completed, and we followed the excursion party that went to drive the golden spike binding the East to the West. At that time our old car, which had not nearly as large accommodations as our present one, contained twenty-two passengers. We slept double, even in the upper berths, and to-day I wonder how it was done.

In those days the game was far more plentiful than now. We stopped at New Buffalo and had duck shooting that was grand, but the next year, when we stopped at New Buffalo, the water had dried up a good deal and the shooting was far poorer, so we moved on to Dawson, Kidder County, which has been, with one or two exceptions, our annual place of rendezvous.

Fifteen or twenty years ago, around Dawson, was one immense wheat field. It was a boom town and locality, but as the settlers found that it was only about one year in seven they could raise a crop of grain, they have gradually petered out, until to-day there are very few grain fields in that vicinity, and the few people there are subsisting by raising cattle and sheep.

On account of the abundance of grain, the geese on their southern flight congregated there in vast numbers. Kidder County is filled with lakes and sloughs, as the prairie marshes are called. We used to pay more attention to goose hunting than anything else. The prairie chicken was unknown in that country then, but there were quite a good many sharp-tailed grouse. Of late the prairie chickens have increased, and the sharp-tailed grouse have decreased, so on our recent trip, out of ninety birds killed, probably three-fourths of them were prairie chicken, or more properly speaking, pinnated grouse. But as I said before, our main joy was in goose shooting.

The modus operandi was to drive out during the forenoon early, and find some big grain stubble on which the geese were feeding, for until disturbed or the feed has been used up, they will continue to come to the same locality. They like the barley stubbles best, but failing in them, they go to the wheat stubbles, where the left-over and lost grain is most plentiful. Finding one of these feeding grounds, we would remain in the locality until the birds had eaten their fill and left for the lakes or watering places, which is usually about 10:30 or 11 o'clock in the morning. We would then go into the stubble and begin digging pits, one for each shooter. If there were four in the party, we would make four pits 10 or 12 feet apart, and about 40 inches deep and 30 inches in diameter, just large enough to sit in comfortably and have your eyes on a level with the ground. The earth was not piled up around the excavation, but scattered, and when the pit was finished, the stubble was pulled, going a distance from the pit for this purpose, and then this pulled stubble was transplanted, all around the freshly dug pits, so as to make it appear like an undisturbed stubble field. The hunter in a grass-colored suit, sitting well down in his pit, was almost completely hidden.

Now came the placing of the decoys. These were 30 or 40 in number, and were always placed to the leeward of the pits, and 20 to 40 yards distant, for the geese coming in with the wind would always turn and swing to the decoys, to alight against the wind. Thus, with their eyes fixed on the decoys, the geese coming into them, would necessarily have to pass over the pits in which the hunters were hidden, to alight among their sheet-iron counterfeits, for the decoys were made of sheet iron, heavy enough so they will not wobble in the wind, painted to resemble geese and stuck in the ground. They are merely profile, but by putting them at various angles, generally headed toward the wind, the incoming birds could see them until they really got over them. It was laughable at times to see geese coming up sidewise to these decoys, suddenly loose sight of them altogether, and you could see them crane their necks around in every direction to see what had become of their supposed brethren.

Now, after preparing the pits and setting out the decoys, and getting our shell boxes, which generally contained a good stiff charge of smokeless powder, and about one ounce of No. 2 chilled shot, we would adjourn to some sunny hillside for our luncheon and smoke, but if it was cloudy and windy, we would have the right to expect the early return of the birds from the lakes to the feeding grounds. On pleasant days, from 4:30 to 5 o'clock, was about the time to look for the birds, but on cloudy days or windy days they would come an hour or two earlier.

A novice would always misjudge the distance and shoot before the bird would be within gunshot. I have known some of my Saginaw friends to stand up and deliberately blaze away at an incoming bird, coming directly toward him, when I am certain it had not approached nearer than 200 yards. But remember it is a prairie country without a single bush to gauge distance by and absolutely clear sky and a bird weighing from twelve to fifteen pounds, and so it is not to be wondered at that they look big and right on to you, when they really were a rifle shot away.

The captain of the party is generally put in the center pit and is supposed to give the word of command when to fire, so that each man can get in his right and left if possible. It is generally arranged so that the center man takes the center of the flock, the man on the right the birds on his side and the one on the left the same. Big birds as they are, and apparently slow flying, it is extremely difficult for a novice to keep cool and shoot right. Many a good man at the trap has learned to his confusion that he could break a clay pigeon easier than he could kill a goose at first. After a while, they catch on.

Wing-broken birds should be gathered immediately, otherwise they will slink away and run off into the stubble, and in an incredibly short time they get beyond finding distance.

In the old days, these goose shoots netted good sport and good bags. It was not unusual for three or four of us shooting together to get 25 or 30 birds in an afternoon or morning flight, and I have known instances where four of us shooting together have gotten as high as 65 birds in one shoot. They are fine eating, fat as they are on the wheat, and being generally young birds and not having toughened themselves by long flights to the south. With the Saginaw party, no game ever was wasted, for what we did not use or give away out there, we brought home for division among our friends.

With the disappearance of grain fields around Dawson and the widening out of grain culture in North Dakota, the flight has changed, or in other words, spread out, so it is not so concentrated. I am speaking of black geese, of which there are three or four kinds; the geese that are most prized and the ones that decoy. The white, or Arctic goose, will not decoy and does not have specific places for feeding, for whatever field the first flock drops down upon, the others will follow, too, and some whim will strike them in the midst of their feeding, and they will all move off to another field, a mile or two distant. The white geese are far thicker than they used to be, and there are dozens of places in North Dakota, where you can go late in the fall and find these birds in thousands and tens of thousands. This year at Dawson we did not get a single goose; first, for the reasons given above, and next, because the weather was like mid-summer, and the northern birds had not come down. At Devil's Lake, the greatest of the northern feeding and resting places for water fowl, where geese are usually in thousands, it was said at the time we were in North Dakota that no birds had reached there from the north yet. But we did have nice shooting upon sharp-tailed grouse and prairie chicken, though the law ran out on the 15th, and we were not equipped with dogs; but at this time of the year prairie chicken do not not lie well to dogs and are in bunches or "packed" for the winter. They are generally found in the wheat stubbles or along the weed patches adjoining them.

The northern ducks had not come down to any extent and were mostly local birds that were on the lakes and sloughs; they were there in large quantities, but had been shot at so much they did not fly during the day; and while sometimes an evening flight would be good for a few minutes, generally they availed themselves of the bright moonlight nights for their flying from one place to another. Some of the lakes were well filled with canvasbacks, and out of 254 ducks that our party of eight got in the two weeks we were there, 37 of them were canvasbacks.

But the Saginaw Crowd does not go so much for shooting birds and the game that they can get as for the rest and recreation, getting away from business, politics, coal strikes and everything else of that kind, that one has to contend with eleven months of the year, and is in great luck if he can skip the twelfth month; filling one's lungs with that grand, pure air of the treeless plain, outdoor exercise and freedom from all care, pay far better than a wagon boxful of ducks or geese. We had birds enough to eat, birds enough to give to our railroad friends passing through Dawson, and that was enough, and I hope that the Saginaw Crowd can take these annual trips for twenty years to come. Three members of our party have joined the silent majority, and will go with us no more, and those that are left notice that they cannot stand so much tramping nor so much fatigue as in days of yore. The enthusiasm of youth is lessened, but we hope that the last spark of it will not vanish for many years to come.

W. B. MERSHON.

Washington Goose Shooting.

SEATTLE, Oct. 25.—*Editor Forest and Stream:* This is the time of year when the honk of the goose is heard every night as the flocks wing swiftly along in a V or wedge, far above the city, in their annual migration to the south. It is a sound that sets the hunter's blood tingling through every vein and conjures up visions of wheat fields, profile decoys and a hole in the ground. In this hole the hunter imagines himself crouching on his knees with every sense alert, waiting for the "wush-wush-wush" of wings.

No one who has not experienced the sensation of waiting for this welcome sound to approach at the break of day, and set his eyes on the glorious old Canadian geese as they wheel into the decoys in broken ranks, can realize the excitement of this sport. It gives the dyspeptic new life; it robs the overworked business man of the blues and makes the slave of the golden nuggets think there is something in life beside the chase for wealth.

A man who has been through it once will travel miles for another charge from the same battery. It is life itself. And when he glances along the barrels of his trusty old shotgun, pulls the trigger, quickly changes the line of vision to another whirring body, pulls the trigger, and then sees two great big honkers tumbling out of the sky with their feathers and wings all askew, he feels like jumping high in air and yelling like a Siwash Indian on his first spree. To make a double on geese is the ambition of every sportsman, but the feat is not achieved as often nowadays as it was ten or fifteen years ago in western Washington, and I feel almost safe in saying the same thing of the magnificent shooting grounds in Oregon.

The Puget Sound country does not offer the best goose shooting at the present time, either on land or water, although occasionally a good bag is reported. Eastern Washington, especially Walla Walla and Yakima counties, affords much better sport than western Washington. The black brant sometimes come into the sound in such numbers that the sportsmen who happen to be on the ground make good killings. The black brant is a relative of the goose, and in some localities has the goose family name attached to it with an adjective of a descriptive character that keeps the brant character from being entirely lost. The barnacle goose of the Atlantic coast is a brant. It is, in fact, the real brant. Out in the Pacific Northwest we do not see this bird, or, at least, I have never heard of it straying out this far. If the black brant has worked its way East it will be news to me. It is probable that members of both species stray into some of the States included in the Middle West belt, and the same is probably true of the black brant.

The goose most common in Washington is the honker, or Canadian goose. Sometimes it is called the gray goose. The snow goose, which derives its name from the color of its plumage, used to be plentiful in California and Oregon. As it passes the summer in the far north, it must come somewhere near Washington in its annual trip to the south. Why it practically overlooks this State I am unable to explain, but I judge from conversations with old residents and hunters, that such is the real condition of affairs. It may be that the migration is along the coast line, well out to sea. If this surmise is true, it explains why California and Oregon claim this bird as one of their winter visitors while we look for it in vain.

A limited number of Canadian geese pass the winter, or a greater portion of it, in western Washington. There are probably more of them than one imagines from the fact that they are careful to select secluded lakes and ponds in which to sleep. When one considers the large stretches of heavily timbered country, dotted with little lakes, it is easily seen how these most wary of birds can be in the country and yet be seldom noticed. They make two flights every day, morning and evening, and this rule is what gives the hunter his tip as to the

on watch and are also careful to select a place where there is clear water all around them. There is usually one or two flocks every winter on Hood Canal. It might be possible to get one or two shots into them by rigging up a float, well covered with brush or something else that would not alarm the sentinel and then float down on the flock with the wind. The first attempt might prove a failure, the birds taking alarm at the strange object, but if there was no attack, they would become accustomed to the float, and look upon it as a harmless object. A second attempt to approach the flock by the floating process would probably be successful, but after one volley the sport would be ended for all time. I have heard of a few geese being killed near Oak Harbor and Coupville on Whidby Island, and I know personally that the birds like those localities. I presume it is the warm reception that they get which compels them to seek other quarters. One afternoon three or four years ago, Ned McCrohan, of Oak Harbor, and myself, sat on the roadside and watched a large flock of geese preparing to settle in the stubble of a field, which was partly surrounded by timber. It was fully three-quarters of an hour before they went down and threw out their sentinels. First they circled the entire field and swooped down as if about to alight.

"They are down," said McCrohan; "I have a mind to try a sneak on them."

No sooner had these words left his mouth than we saw the entire flock suddenly rise into view and commence circling again. They went very slowly and appeared to be examining every inch of ground for signs of danger. As we had been shooting quail in that field only a short time before, the geese may have imagined that a foe was under cover. It was amusing to see the way they inspected the side of the field along which the woods ran. They would approach rather high in the air and wing slowly along, gradually dropping down to a height that seemed to us not much above the trees. They would float along and then suddenly climb up into the air at an astonishing rate. I don't suppose that all flocks require three-quarters of an hour to make up their minds to take earth, but I mention this instance to show how careful they are.

We learned of a field where a certain flock made its appearance every day at a certain time. Our plans of battle were as carefully arranged as possible, and when we took our stands everything was in apple-pie order. The water in which the geese passed the afternoon was a comparatively short distance from where we lay, and was separated from us by only a narrow strip of timber. We could hear the geese, so we knew positively that they were in the vicinity, and it seemed certain that our plans were about to be successful, provided we could shoot straight. We waited, and we waited. The "appointed" time came and passed. Still we waited. We were calm outwardly, but inside all sorts of emotions were playing ping pong with one another.

"Now, wouldn't that make you sick," remarked Mac, as we crawled out of our hiding place and started for home. If I remember correctly, I answered in a manner that destroyed all the good marks we must have received for the outward calm maintained so long under high pressure.

The next morning Mac and I went up to the post-office when the steamer Fairhaven came in from Seattle. The farmer who owned the field where we had planned our battle and subsquently fought it out with ourselves, was just hitching his horse. He looked up with a sort of half apologetic, half amused expression, and remarked:

"Say, Mac, those geese were in that field less'n fifteen minutes after you got out."

"—— smart geese, said Mac.

Once in a great while a flock of geese will light in Lake Washington, but never on Sunday. They couldn't find their way down through the rain of lead anywhere from the head of Squak Slough, through Lake Washington to Renton and from there to the end of the White River valley. Last winter, during the snowstorm that made all Seattle wonder what had happened, Lake Washington went on a rampage and threw things at the Eagle Boathouse into all kinds of shapes. Captain Jacob E. Johnson and Otto Stark came tumbling out of bed to see what was going on and found enough to keep them busy all night. Between the boathouse and the ferry slip was a large barge loaded with wood. The barge discharged its load into the water, and when Stark appeared on the scene, cordwood was floating around in all directions. Among this wood, and serene as if nothing had happened, floated a large bird. Stark watched it, and it watched Stark, but made no effort to get away. Suddenly Stark caught on to the fact that he was looking at an immense Canadian goose. "It didn't take me more than thirty seconds to get my gun," said Stark, "but when I got back the goose had disappeared." The goose, like many other birds and animals, may remain still when surprised, until the surpriser makes a motion, then it immediately seeks safety in flight.

Eastern Washington offers the best goose shooting in the Pacific Northwest north of Oregon. Eureka Flats, thirty miles northwest of Walla Walla, is the most famous ground. It is an immense wheat field, about thirty-five miles long by fifteen wide. No one lives on it permanently, and after the harvest it is deserted save by wild fowl and hunters. Geese find good feed, but are compelled to fly every morning and evening over to the Snake River, some twenty-two miles, to get water. This condition of affairs has given rise to the story that when the geese come south in the fall they all bring canteens of water with them to the Eureka Flats. The farmers haul water around on wagons during the planting and harvesting seasons. Horse Heaven, in Yakima County, is another favorite spot. Many places along the Columbia River, which forms the dividing line between Washington and Oregon, affords good sport.

Across New Brunswick on Snowshoes.—VIII.

THAT we had not yet left the moose country was abundantly proved the first evening Henry Braithwaite and I went out to prospect from his Indian Lake camp. We followed along his trapping trail for a couple of miles and counted fourteen distinct moose trails, old and new. I found the country here thickly timbered, with hills perhaps not quite so steep as north of the Tobique Divide. We were still in the great central wilderness of New Brunswick, and had abundant proof on all hands of the plentiful supply of game.

"If we only get a good hunting day to-morrow," said Henry, "I think I will be able to show you something."

At the last moment—that is to say, the next to the last day of the shooting season—fortune smiled on us to a certain extent. A gentle snowstorm came on which deadened the sounds on the old crust and which was attended with sufficient wind to render the woods a bit noisy, conditions which make to the success of a moose hunt on snowshoes. Carefully consulting the direction of the wind, Henry started up a long ridge back of the camp, which I think he called Beckwith Mountain. We two went alone, Adam and Charlie staying at the camp. Adam told me to go ahead and kill a moose if I could, as he thought I would feel better if I shot something before leaving the country; and since both he and Henry seemed entirely agreeable to that effect, I resolved to do a little hunting that day, and see if the luck was going to turn at the last moment.

Henry and I labored on up the mountain for a couple of miles or so and found ourselves by that time in the very center of what seemed like a general moose yard, extending over a mile or so of ground. There was abundant horn sign, and very many trees showed the sharp chisel marks of the moose family. The ground was cut up with the deep tracks of moose, which seemed to be traveling backward and forward between this ridge and another higher one which lay across a little valley from us. Henry picked up the freshest of the larger tracks and we made a cautious little hunt after a bunch of three moose, one of which seemed to be a big bull. We had about the same luck with this which had attended me heretofore. We watched the sign gradually grow fresher, timed ourselves so that we concluded that we were but a few minutes back of the moose and at length came to the beds where the animals had been lying down. Beyond the beds stretched a series of widely separated tracks.

"Jumped."

"Jumped!" said Henry. I was used to the word. We had jumped a good many moose before that, and I was beginning to believe that we would never be able to get good enough weather to make it possible to come up with a moose on this kind of snow.

We tried again, presently finding another fresh trail, and once more we went through the same performance. "Jumped," said Henry, and we looked wrathfully at the series of tracks showing where a good moose had gone off at a gallop.

We pressed on up to the top of the ridge, winding in and out, and at length we came to a series of tracks which we knew could be made only by good bulls. There were three of these trails, and we were satisfied that we had game here worth the following. We crept along on this promising lead for a half-mile or so, and finally found ourselves at the top of a little ridge, beyond and below which lay a bit of dense cover. We worked up a little above the trail in order to have a better chance of seeing the game. "It's no use going down in there," said Henry, "for we couldn't see to shoot if we did start the game." Hitherto we had been hunting in fairly open country, which would allow us to see game in some cases for 100 yards or more.

Still reluctant to leave these big tracks, we swung down the hill, across the series of zigzagging tracks of the yarding moose, and followed along the hillside for a little way. Presently we came to three great beds in the snow. "Jumped!" said Henry, and we saw where the last moose out of seven which we had started had gone off through the thick cover. How they did it without our hearing them is something we never could tell. It is possible they heard us speaking as we stood on the knoll directly above them. At any rate here were the gallop marks. In some places we could see where twigs had been broken off and carried forward on the trail, undoubted horn marks. Moreover, when we went back to the beds we saw where one moose had cut a big groove in the snow with the tip of his antler as he swung his head around. So now we knew that we had jumped three bulls, and that at least one of them had good horns. Of course we did not undertake to follow any of these moose, for that is something no moose hunter thinks of doing.

We swung around on the back trail from the place where we had jumped these last moose, and came down into a little valley where there was a sort of pool or spring at the head of a little brook. Here the ground was tramped down as though it had been a cattle yard. How many moose there had been that morning tramping and standing around in the water we could only guess. There was a regular trail leading up, and many radiating trails. It was from this place, without doubt, that the three bulls had come which we had but recently started.

"If we had been here an hour earlier," said Henry, "we could have shot into the flock."

At Last.

By this time I must admit I had lost considerable of my hopefulness in regard to the moose question. I had been out with the best moose hunters in the Province, and we had certainly started moose every time we had gone out, but first one thing and then another had been against us, although I felt that we had done all that any hunter could have done. So, half the time a trifle chagrined at the probable failure of the hunting side of my trip, and again reflecting on the foolishness of that, since I had had so grand a time, I blundered along with head down, after Henry, as he plowed on through the blinding snow, which was now sifting down steadily. We walked from this stamping ground of the moose perhaps 200 or 300 yards, there being moose trails to the right above us on the hill, and some more off to the left. Henry's active eyes were scanning the country steadily as he went on, although I must admit that I was about ready to conclude that my last day's hunt was drawing to an end, although it was not yet noon.

All at once, as I glanced up, I saw that Henry had stopped, and I saw the wave of his gray-mittened hand, which told me to come forward quickly. He didn't say anything, but looking in the direction toward which he was glaring, I saw, up on the hillside above us and a trifle behind us, some 75 or 80 yards away, a large, dark, indistinct outline, half-hidden among the trees.

There are all sorts of curious things which you see in the woods when hunting, stumps and tops of bunches of roots, boughs, all of which sometimes take on the appearance of game. Yet as quick as I saw this dim outline, showing heavy and black through the trees, I knew that it was a moose, my first moose, a live one, a wild one, and, of course, a bull, else why should Henry motion me to shoot? I did not see the head of the bull at all, and, as it seemed, neither did Henry, although he stood further to the left than I did, and had a different view. In an instant the cover was off my gun and I was holding for the only spot of hair that I could see, a spot of black about as big as my hat. This was the only thing that I could see clearly enough to shoot at, and I didn't pause to argue with myself whether or not it was the right part of the moose's anatomy. As quick as I could get the tall front sight of the .30-40 down to where it belonged, I turned her loose, and instinct told that the shot had gone home. I also felt at the same instant that the game was ours.

The animal, which had been struck by the first bullet, made no leap nor bound, nor yet did it sink down in its tracks. A few steps would have taken it across the ridge and out of sight, but it was too weak to go up hill in that direction. It half-turned and came staggering and blundering down the hill toward us.

Horror.

Horror of horrors! As it turned toward me, and showed through an opening in the trees, I saw the great gaunt head of the creature extended far out in front of it; and it had no horns! Instead, I could see two little bumps in front of the ears, and even on the instant knew that the bull had shed his horns!

Sick at heart, I none the less stuck to the adage that it is well to throw lead as long as there is hair moving. As the moose blundered through the trees for perhaps fifteen or twenty yards down hill, I fired at it five times, if I kept my count correctly. I had told Henry that if I shot at a moose and it seemed to be getting away, he was to shoot at it, too, as I didn't want another wounded moose about loose in his country, and as I was getting scared at all of this talk about small bores not killing a moose. It was after my second or third shot, I can't tell which, and neither can Henry, that Henry turned loose his famous two-bushel gun. I presume there is no better game shot than Henry, but just as he fired he met with one of the accidents which sometimes happen to the best of men. He slipped off his snowshoe as he braced to take up the recoil of his rifle, and just where he landed on the landscape is not yet fully determined. We found one bullet in a tree. Henry said it was mine. Also we found two bullet marks or so on the snow above the place where the moose finally dropped. We thought one of these might have passed entirely through the body of the moose, but were never sure. It was all over so soon that no one could tell how it happened. Henry called out to me, "Don't shoot him any more, he's all right now," although the moose was at that time still standing, perhaps three or four seconds after the first shot had hit him. I kneeled down on my snowshoes and at the last shot caught a fairish view of the hindquarters of the moose as he stood nearly broadside to me. This time I thought I would shoot him through the backbone just in front of the hips, as I had a good sight of him for that shot. At the crack of the rifle he fell in a heap and Henry and I then went up to him. The poor beast was swinging his head about in misery, and I finished him with a shot back of the shoulder. So, horns or no horns, it was ours, and it was dead. I wished very much for a while that he was alive. Then on the whole, after mature deliberation, I concluded that I would rather wish that he had horns. He was a beautiful five-year-old bull, dark, as are most of the forest-shaded New Brunswick moose, and of just the right age to have a splendid set of antlers. He had shed his horns but very recently, one of the stumps being still bloody. Henry and I stood by the side of the poor old fellow, and now admired his proportions, and now cussed at the hard luck which had terminated my hunt in this particular fashion.

At last we began to search the moose for bullet holes. "Who cut this big hole in his shoulder?" said Henry, pointing to a wound on the side opposite to that which the moose had turned toward me when I first shot at him. "Why," said I, "that's your tomato can load sure, for I never shot at the moose when its right side was turned toward me." Henry shook his head. "I don't understand that," said he. "If I had hit him he wouldn't have come down the hill to say good morning to us."

I had a lot of fun with Henry on the way home, nor did he feel easy in his own mind about it until the next day, when we cut up the carcass. Then we found that his shot had not struck the moose at all. I don't know whether the concussion knocked the moose down or not, but I understand it isn't necessary to hit a moose very much with a big-bore gun. In the mix-up among the trees, the moose had certainly turned his right shoulder to me, though neither of us knew it. My first shot was delivered very far back, passing entirely through the paunch. It practically killed the moose, nor did the animal really require another shot after that, although it was not knocked down. Had I used my own judgment and stuck to the hollow-point bullet, instead of the soft-nose, which Adam advised me to use, I think this hollow-point would have destroyed the animal at once, for the bullet would not have passed through, and the shock would have been very much greater. As it was, the moose was made very sick and would have sunk down very shortly had I given him time. It stood no longer than I have seen a sheep stand in the same place, and did not even go so far as I have seen an antelope go shot through three times with a .45-75. The second

shot struck him at the back edge of the right shoulder, passed through the lungs to the opposite shoulder and lodged against the skin. There was one, or perhaps two, bullet holes further back through the carcass. The shot which I fired for the front of the hindquarters was placed a little too far to the right, and struck directly on the hip joint. I never in my life saw a worse case of bone smashing than the soft-nose did there. The joint and hip bone for a space of about a foot were literally crushed into fragments. Even Henry had to admit that this bone was pretty badly mussed up, and he said he had never seen the interior of a moose much worse disorganized. The water of the paunch had escaped into the abdominal cavity, the lungs were shot up, and in fact there was nothing good about the works of that moose when we got through with him.

Just to show that he had an argument left in the box, Henry said, "If that moose had been in the fall in the runn'ng season, when they are fuller of vitality, he would have skipped away with that hole through his paunch and never have minded it, and we should have lost him sure."

Perhaps. I don't know. I only know that this moose was stopped with the first shot of a .30-40, and that delivered almost by chance in a part of the body where the old black powder loads would not have stopped an antelope. I have rarely seen game dropped absolutely dead, and shall always be satisfied to stop my game this close. I think the destructive effects of the .30-40 when shot through the paunch of an animal depend very much upon the amount of water there happens to be in the paunch at the time, the explosive quality being much greater in soft or moist tissue or in water. This moose had his paunch filled with a most astonishing quantity of garden truck, apparently a wash tub full of bark and buds which he had chewed up. The bullet passing through this mass of food had carried a tremendous shock. I am not ready to say that my rifle is the best one on earth, and I realize the good judgment and far wider experience which friends of the big bores have, but it still remains a puzzle to me how any one can shoot a moose a half-dozen times with the .30-40 and not get him—that is to say, provided he shoots him in the hollow of the body, or indeed shoots him in any way but the most rankly tenderfoot fashion. I don't know about the other small bores, but I am speaking now only of the .30-40 rifle which I used. Henry admitted that he had never seen the .30-40 used before, or I so understood him. I am still wondering whether he would rather have seen my moose get away than to have him killed with a small-bore! It was pretty rough on Henry, when you come to think of it—to go down into his country on long snowshoes, on rubber shoes, with a small-bore rifle, and to kill the tame moose which had been making all these tracks around his cabin!

"I guess I have about put you out of business," said I to Henry, as we finally talked the matter over. "I guess so," said he, grinning. "I will have to go out of the moose business now sure, but I have got my pet caribou left yet to fall back on."

Henry told me that when he saw this moose first it had the end of its muzzle stuck out in front of a bunch of trees and he could not see the rest of its head. It was eating at the time, and he could see its jaws moving, a fact to which we no doubt owed our shot. When a moose is chewing anything its sense of hearing is practically suspended for the time, and a feeding moose is easier to approach than one lying in its bed. This old fellow was standing above us, which is certainly the best place from a moose point of view; the wind was blowing directly from us to him, which was another point in his favor, and moreover, we had passed entirely by him and below him on the hillside. Just how on earth it happened that we could get a shot under such conditions, let him explain who can. Henry told me that this was an old moose and very poor, and probably thick-witted. "I don't think he would have wintered through anyhow, if you hadn't shot him," said Henry, grinning. It's astonishing how these big-bore men hang to their convictions.

Henry and I went back to the water hole to boil the kettle after killing our moose, and after opening the carcass and preparing it to keep over night. It came on to snow good and hard now, and the mountains were wrapped in a blinding blanket of falling white, so that Henry had to get out his compass several times. We got home in good season that evening, and had a mild sort of jubilation at the camp, making it as pronounced as we dared in view of the fact that our moose had no horns.

"Well," said Adam, "I'm mighty glad that you got your moose, but I would have been just a little gladder if you had killed him north of the divide, and a heap gladder yet if you had killed one with horns on."

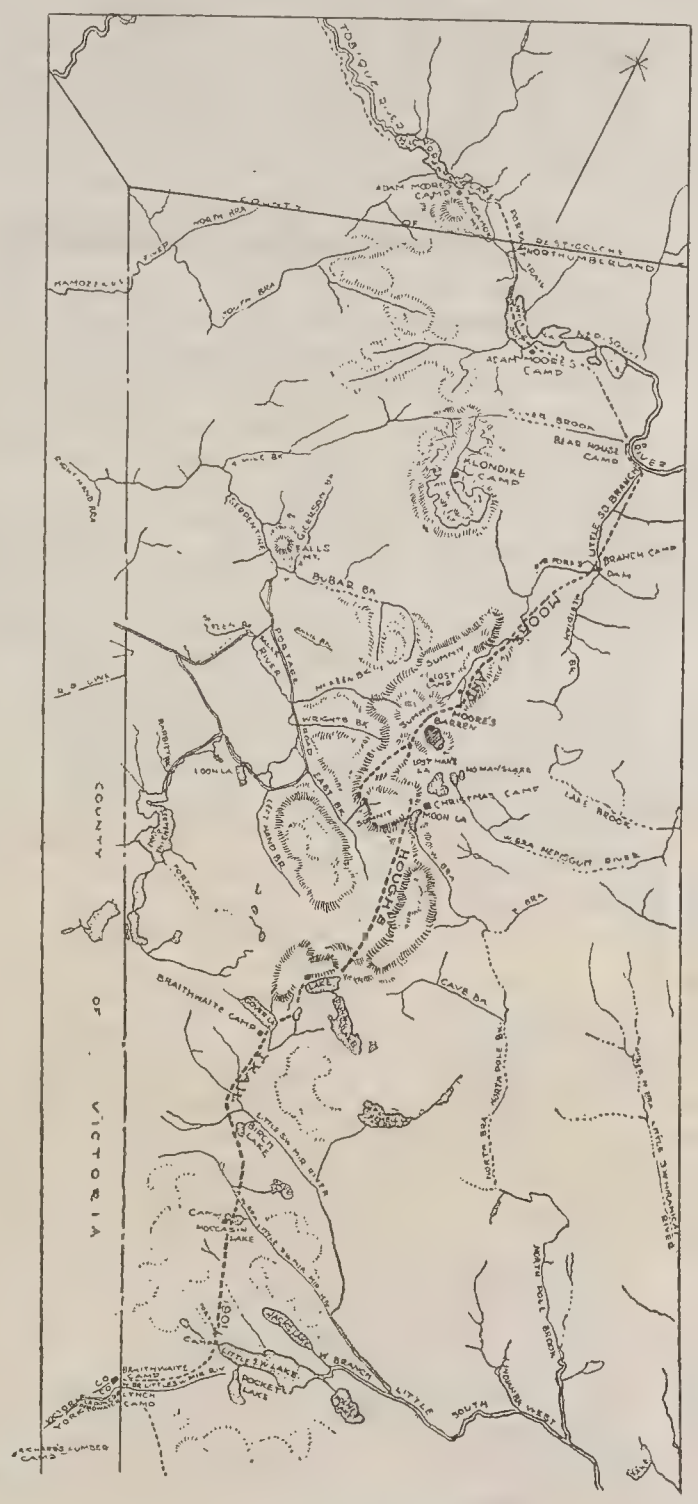
I explained to Adam that it was my practice always to kill moose close to the trail and without any antlers, so that it didn't make hard sledding to get the trophy out to the settlements. We brought out our meat and hide and scalp the next morning, and this ended our hunting operations.

Henry finished his season with just one last half-day, of which he wrote me after I returned home. He says: "I went out along my trapping trail and got up to a bunch of five moose. I emptied the old tomato can at what I thought was the biggest moose of the lot, and when I got up to him I found that he had only one horn!"

I heard that one or two other parties who were in earlier than ourselves killed moose with one horn or none at all. Henry told us that the moose which made the big sign at his Christmas camp, the same one which Adam and I followed in the rain, had only one horn, for he had seen him the morning when he went up to that camp. Adam and I were then sure that the big cow which we had seen on the Moose Brook trail was a bull which had shed its horns. That was two weeks before the date on which I killed my moose. We felt quite sure that the thaws and soft spells had the effect of making the moose shed their horns unusually early. Perhaps one-quarter of them had shed by Dec. 15. Both Adam and Henry found in this a good argument for setting forward the date of opening the season of moose to Dec. 1 instead of Dec. 15, and closing it Dec. 15 instead of Jan. 1.

He would have been a poor sportsman who, after a trip like mine, would have felt that he had any complaint, even if he could sing with the poet, "How sharper than a serpent's tooth it is to have a hornless moose." Perhaps I ought not to have felt so cheerful about it, but I really felt satisfied in every regard with my trip, although I could not say that I wanted to start for home.

It was a bright and sparkling winter morning when at last we said good-by to Henry and his son-in-law, Albert, at the Indian Lake camp, leaving them to attend to their trapping operations while Adam, Charlie and myself started for our long trail of forty miles or so to the settlements. We had two toboggans pretty heavily loaded, so Henry advised us not to undertake any short cut across the hills to the Richards lumber camp, seven miles distant, where we hoped to find a tote team going down the road to the railroad. It was twenty miles around by the Crooked Dead Water trail, but we had a chance of catching a team at one of the two or three lumber camps which we should pass. We got into the first of these camps at about 10 o'clock in the morning and stopped for tea and pie. We made the next, one and a half miles, in jig time, coming to Dan Kelly's camp, and ate some more pie and tea, this making the third meal of the morning. Still we found no team, and as we were in a desperate hurry to get out to the settlements, we pushed on down the road, crossing the terrible climb of the County Line Mountain, around the head of Renous Lake, and so at



ROUTE OF THE EXPEDITION.

length reached the next camp, known as the Lynch camp, about six miles from Kelly's, and twelve to fifteen miles from Henry's Indian Lake camp. Here we had some more pie and tea and things. We still had at least nine miles to go to make the Richards camp, where the tote teams started for the settlements nearly every day. We tried to hire a team at Lynch's camp, but the owner of the team was away and no one would let us have it. After we got down the road a piece we met the owner, and he gave us a lift, which seemed very gratifying to us at the time, although we would have gone through to Rodgers' at any rate, for our blood was now up and we were hitting the trail for all there was in us. We were now in fine shape, physically, barring Adam's bad cough.

We spent a pleasant night at the Richards' camp, and met there Ed. Norrand, a guide who was driving a tote team, with whom we arranged to take our stuff down the road the following morning. That day was the hardest of the whole trip, for it came off very cold, and we were traveling over the hardest road the eye of mortal man ever saw. Of course we could not sit in the sleigh very long in such weather, but walked a good part of the way. It was nearly dark when at last we came to the open ridge known as "The Clearing." Here the storm was blowing a regular blizzard, and the snow was drifting badly, and it seemed that we would certainly freeze before we could make the lights of the Holtz farmhouse, where we intended to pass the night. We did make it at last, however, and by 9 o'clock found ourselves once more under shelter, warm and comfortable. Thence it was only nine miles to the railroad, and we made Boiestown the next morning in easy time for the train, reaching Fredericton at 1 o'clock of that same day. Here we had to do considerable in the way of explanations. Billy Chestnut said he hardly expected we would get any moose, for the weather had been bad, and nearly every party who had gone out had complained of the snowshoeing. He himself had made a nine-day trip, but did not get a shot. I was told at Fredericton that no sportsman had ever made the trip south across the divide from the Tobique and down the Miramichi, so that I presume on the whole my trip was to be called about as eventful as that customarily made by visitors to New Brunswick.

It was a great pleasure to spend some time with Mr. W. P. Flewelling, Deputy Surveyor General, at the Crown Lands Office, examining the splendid collections in natural history, etc., which are to be seen in that department of the Governmental offices. There is a grand collection of New Bruswick animals here, as well as a great many photographs, maps, views, etc., taken in all parts of the Province. I don't know whether it is generally known, yet is the case, that the splendid George A. Boardman collection, which was the object of the loving care of that well-known naturalist, passed into the hands of the New Brunswick Government shortly after the death of Mr. Boardman. The birds and animals of this collection cover a wide part of the fauna of North America and are beautifully mounted and preserved. I felt under very many obligations to Hon. W. A. Dunn, Surveyor General, and his obliging lieutenant, Mr. Flewelling, who did everything possible to make my stay pleasant and placed every source of information at my disposal. Mr. Flewelling was so good as to make me a map of the whole section of New Brunswick traversed by our party. He explained to me that the lines of the survey run across the country east, west and north and south, a distance of five miles apart. The surveyors do not in all cases know what there may be in such a square of five miles, the interior of which they do not always visit. We had crossed two or three blocks of this sort, which have not as yet been fully mapped, and Henry, Adam and myself were therefore able to offer some suggestions in regard to the location of lakes, streams, etc., which we had met in our wanderings. We put in three new lakes, arranged a few streams, and reset a mountain or two, all of which shows that old New Brunswick still is new and has news in it.

Mr. Albert Everett, our host at Windsor Hall, called a little meeting of sportsmen for the evening of the day on which we arrived in Fredericton. There were present at this enjoyable little banquet the following gentlemen: F. B. Edgecombe, President of the Board of Trade; C. Fred Chestnut, President of the Tourist Association; W. P. Flewelling, Deputy Surveyor General; W. T. Chestnut, H. B. Atherton, George W. Hoegg, A. A. Tweeddale, H. R. Babbitt, A. A. Shute, William Walker, H. G. Chestnut, Adam Moore, Charles Cremin, John Macpherson, R. P. Allen, E. J. Payson, and others.

It was like pulling teeth to say good-by to big Adam Moore and Charlie Cremin. Every fellow who reads the FOREST AND STREAM knows how much he gets attached to friends of the out of doors. They are the best sort. So perhaps the least said the better. I can quite agree with Mr. L. I. Flower, of Central Cambridge, N. B. (who waited eight days at Fredericton to meet our party when it returned, and who was originally to have gone in with us. Mr. Flower left for home the very morning of the day on which we arrived, hence I had to meet him only by correspondence). "You are right in what you say," said he; "your Uncle Adam Moore is no ordinary man. His level-headedness and common sense are qualities many a man might envy, and as to his physical endurance—don't mention it."

Adam and I finally managed to break away from the blandishments of Fredericton, and start for our little journey to Chicago. This was my first experience in hunting east of the State of Michigan. I have never been in any country where there is so much game to the square mile as there is in New Brunswick. I have never been in any country where a man gets a better run for his money, nor where he comes away with a greater consciousness of having received perfectly square and honorable treatment in every regard. I fear we may no longer hope for the old days of freedom and abundance in American big game. Under these changed conditions and under the modern limitations, I do not believe the superior, if, indeed, the equal, of New Brunswick exists as a hunting country in any region accessible to the sportsmen of the United States and Canada. My own hunt was not made exclusively for the purpose of killing game, but for investigation, and it gave perhaps unusual facilities for learning in regard to the abundance of game. I want to say that the game is there, and the guides are there, and if you don't get game, it is not their fault, but your own, or that of the weather. We had unusually bad weather during our trip, or I presume I might have written a much bloodier story—might perhaps have told a story of a better trophy. December is the hardest month in the year for a moose hunt, but I certainly could not ask a better time than I had. Adam says we are going to do it all over again some time. "I am thinking up some other fool trip for you and myself to go on two or three years from now," said he. "We'll start across the country to the north somewhere, and come out by way of Labrador or Hudson Bay, or some other place in foreign parts." Dear old Adam, and dear old Henry! That's the way one feels about it. May they live forever, kings in their wilderness kingdoms. It will long be one of my pleasant memories that I was along when the trail blazed between their principalities.

HARTFORD BUILDING, Chicago, Ill.

New Jersey's Game Birds.

Editor Forest and Stream:

In preparing a report on the game birds of New Jersey for the Fish and Game Commissioners of that State, I should be exceedingly glad to receive from sportsmen and others information in regard to New Jersey's game birds. For example, it is desired to know the comparative abundance or rarity of game birds at stated localities. Where, for instance, is the ruffed grouse or partridge present or absent in New Jersey? What is the distribution, in summer, of the wood duck in New Jersey? At what times do the summer resident game birds nest? Do they rear one or two broods? What are the times of arrival and departure of the migratory species—the snipes, plovers and ducks? What are the local names of game birds in New Jersey? This last is a matter of especial importance. By game birds, it may be added, is meant the ducks, geese, swans, rails, coots, gallinules, woodcock, snipes, plovers, curlews and other shore birds, partridge, quail, dove and reed bird. I trust that sportsmen will aid me in this matter.

FRANK M. CHAPMAN.

AMERICAN MUSEUM OF NATURAL HISTORY, New York City.

My First Moose.

Editor Forest and Stream:

For many years past I have regularly visited the Maine woods during the shooting season, and have spent many delightful days in the pursuit of partridge and deer, with excellent success. There was, however, an aching void in the fact that I had never in any of my trips encountered a moose. I have lain in wait in all sorts of likely places for them, followed fresh tracks for miles and miles, shivered on bogs cold nights, while my guide endeavored to imitate the love call of the cow in hopes of attracting to us the monarch of the forest. All our efforts failed, however, and I had to be satisfied with deer and partridge and the bracing air and delightful scenery of the lakes and woods.

It has been said that "all things come to him who waits," so this year I tried again, selecting a new camp, opened for the first time this fall on Chandler Pond, about thirteen miles from Ox Bow. For the first three days I saw nothing but deer, mostly does, but the fourth day while paddling in a canoe on a stream winding through a bog, I came upon a large bull and cow moose in the water, about fifty yards off. I almost lost my breath and felt my heart beating like a trip hammer.

The bull jumped out of the stream and hid behind a thick clump of bushes, the tips of his antlers just showing over them. I calculated as nearly as I could where his neck and shoulders ought to be, and gave him my first shot. He started slightly, but d d not run. I sent my second shot through the bushes, and he started slowly toward the water. The next two shells missed fire, and I came very near being profane. As I threw the last shell from the magazine into the barrel, his head and part of his neck appeared with blood streaming from his mouth. This gave me a chance to put a shot just back of his shoulder, which brought him to the ground, and I said in my heart, "He is mine!" Probably a minute did not elapse between my first shot and the time he was down, but it seemed to me about half an hour.

The animal proved to be a large one, with a fine spread of antlers, which I hope will soon grace my dining room. My belief and theories in regard to the great shyness of moose and the difficulty in getting near them, are rudely dispelled by this experience. I would not believe that a great animal like this could possibly stand still and let me deliberately pump lead into him as this one did, and what seeemd equally strange was that the cow remained standing in the water looking at us during all the shooting, at no time over a hundred feet off. As we paddled past her on our way to the spot where the bull fell, she quietly walked out a short distance from the stream and began browsing. We saw her there again on our way back to camp, and also another cow, to which we paddled so close that I could easily have touched her with my paddle as she was swimming.

I have wa.ted several years for my moose, but have the satisfaction of feeling that he has been growing all this time and developing a fifty-inch spread of antlers, with twenty points.

My guide was Roach Adams, who, with Almon Currier, owns the camps at Chandler's Pond. I cordially recommend them to any one seeking big game and comfortable quarters. J. T. SHERMAN.

NEW YORK, Oct. 31.

What Made Gurth Sit Down.

STEVENSON, Conn., Oct. 28.—*Editor Forest and Stream:* I have read the letters of your correspondent, Charles Cristadoro, with much pleasure, and while I have occasionally wanted to ask him to "hark back," I have not until now done so. I have known "Crissy" ever since he began carrying his first muzzleloader, and could many a tale unfold, but I wouldn't do that. In his "A Gun-Shy Squirrel Dog," however, he vilifies one of the best dogs that ever lived.

To start with, he calls him a "mixed collie." Gurth was a thoroughbred and to the manor born. In his younger days he was squire to a stallion named Ivanhoe, a loyal squire to a knightly horse. Later on he was one of the best of cattle and farm dogs, and, while I would not vouch for his letting down and putting up bars, I could spin yarns by the score illustrating his knowledge of dog lore that might only serve to bring me in dispute with your readers. Crissy was right about his getting a charge of bird shot, but, to use the language of a neighbor, I "disremember" any bird being killed, my recollection being that the bird flew off into the bushes in the opposite direction from where the dog was. He was correct, also, in that the shot made Gurth gunshy to a certain extent. All his life he enjoyed going gunning with me and had no objection to a neighbor joining, but if he saw one of those city fellows with a gun he went in the house and sat down. I often felt like following him; indeed, Crissy brought one gentleman up here, and after watching one of his performances in the field, I did follow the dog's example. If a bird flushed or a rabbit started he would, with gun held about as high as his hips, whirl round and round, his eyes bulging out and reminding me, for all the world, of a story I once read of an experiment with flying artillery during the Civil War.

A bright young officer conceived the idea of strapping a small howitzer on a mule's back so that the muzzle would stick out over his tail; and the plan was that when they got the enemy started they would run the mule to within shooting distance, turn him around, and fire. To see how the thing would work, he and some brother officers got a mule, strapped on a gun, loaded it, and, as this was an experiment, stuck a piece of safety fuse in the touch hole. Then they led the mule up on a bluff on the bank of the Mississippi, headed him so that the gun pointed across the river, touched a match to the fuse and stepped a few paces in front of him to await results. The mule no sooner heard the sissing of the fuse than he turned his head to see what was going on, and began revolving. At the first turn those officers made a break for the foot of the hill in as many different directions as there were, and with more celerity than I started for the house when I saw Crissy's friend revolving. When the gun went off it was pointed inland, and the recoil tumbled the mule heels over head into the river, when the weight of his armament sank him out of sight.

Notwithstanding the fact that the collie would not venture out with Crissy and his friend, they often had dogs that were vastly greater nuisances. I remember a pointer pup that they brought up here that was a wonder. They could do nothing with him, and as I only went along to show likely places for birds, they made me lead him with a string. Off by myself I would let him go. I don't think he ever intentionally flushed a bird, for he seemed to have no more nose for a bird than for a turnip. I saw a flock of fifteen or twenty quail get up all around him one day as he was trotting through a meadow, and he was so scared that he didn't know which one to run after, although if he saw a bird get up ordinarily he would chase it as far as he could see it. The only bright thing I ever knew that dog to do was one day when a friend of mine, who was out with us, shot a quail and waited to load before picking it up. When he went for it he found that dog snuffing around apparently trying to "find dead." He called me and we encouraged the dog and looked ourselves, but had to give it up. A little further on my friend flushed another bird and killed it. This time he didn't wait to load, but started for the quail, and a moment later he called out, "Say, R. S., I know what became of that other quail and this one, too. This dog swallowed 'em both. I saw him pick this one up and swallow it before I could get to him." We didn't "accidentally" shoot the dog, but I put the string on him again and concluded that while he might make a pot hunter, he would never make a sportsman's dog. R. S.

Massachusetts Association.

68 DEVONSHIRE STREET, Room 6, Boston, Oct. 30.—*Editor Forest and Stream:* I send you herewith the call which the Massachusetts Fish and Game Protective Association is sending out to the various organizations of the State that are interested in fish and game. Past experience has shown the importance of co-operation in order to prevent the passage of bad laws as well as to secure good ones.

Legislators are always anxious to please their constituents and only when there is a substantial agreement among sportsmen themselves can they expect success in legislation.

The anti-sale law of 1900 was the result of harmonious and united effort on the part of those interested from all parts of our State. The reports that have been received by the Commissioners and others indicate that game birds have become more plentiful since the passage of the law prohibiting the sale of woodcock and partridge, and it is believed that this law should be placed permanently on our statutes. I desire to add that while the call is sent chiefly to organized bodies, all sportsmen and other persons interested in legitimate protection will be welcome at this gathering.

HENRY H. KIMBALL, Secretary.

No. 68 Devonshire street, Boston, Oct. 28.—Dear Sir: At a recent joint meeting of the Board of Management of the Massachusetts Fish and Game Protective Association and the Executive Committee of the Massachusetts Central Committee for Protection of Fish and Game, it was voted, that, in view of the excellent results from the Convention of Sportsmen's, Farmers', and other clubs and societies, held in December, 1899, and the organization of the Central Committee, the secretary be instructed to extend to all such clubs, and others interested, an invitation to meet in convention at the Copley Square Hotel, Boston, on Thursday, Nov. 13, at 2 o'clock P. M., for a full and free discussion of fish and game interests; the reorganization of the Central Committee, and to take action on the re-enactment of the Anti-Sale law on partridge and woodcock which expires this year, and on such other measures as delegates may desire to bring before the meeting.

You are, therefore, cordially invited to send one or more delegates from your organization—as many as can come—and, if possible, to remain in the evening and dine with the members of the State Association, at 6 o'clock, P. M.

After the dinner the discussions will be continued.

The secretary begs to remind you that "eternal vigilance" is the price of protection, and he hopes every organization receiving this notice will be represented in the convention.

Kindly fill the blanks on inclosed postal and return the same as early as possible, to enable the secretary to make arrangements to accommodate all. Yours truly,

HENRY H. KIMBALL, Sec'y.

Concerning Breaking the Chain.

DANBURY, Conn., Oct. 26.—*Editor Forest and Stream:* In the issue of Aug. 30 of the FOREST AND STREAM, the head lines "A Chance to Cut the Chain" attracted my attention. It contained an invitation from that true and thorough sportsman, B. A. Eastman, of Barre, Vt., to any sportsman to come and spend a week's shooting on grouse and woodcock in the beautiful hills of the Old Granite State. As I lost no time in responding, I was the lucky man to be accepted.

Arriving at Barre two hours later than schedule time, I was nevertheless espied and heartily welcomed by Mr. Eastman at the little station. On Monday, Sept. 8, after dinner, I was introduced to Mr. Eastman's pets, the dogs. First the pointer, Jack, a fine specimen of his race and a good one in the field, as later developments proved; then the 'coon hound, Jake, whose amiable disposition betrayed nothing of the fighting qualities in him when tackling a fat old 'coon; and last, the foxhound, Captain, a finer specimen I have not seen in a good many years.

To make it short, we spent a fine week together on grouse and woodcock. Although we never got the limit of five birds each for one day, we did not get discouraged, and were perfectly satisfied. Mr. Eastman is a crack shot, and whenever his gun cracks, the whirring partridge, or the whistling cock, tumbles to the ground and is retrieved by Jack in beautiful style. I also had a good chance to initiate my own dog, Rod, into first actual retrieving in the field, especially on woodcock. I do not expect to get very many at home of these apparently vanishing birds, although in Vermont by no means scarce as yet, for I found not the smallest alder covert or cedar swamp that did not contain some of the brown beauties.

If there were a few hundred more of the Eastman type of sportsmen, many a one of the fraternity could be made happy by a week's shooting, as per such an unselfish and liberal invitation. Board, guide and team were given, to say nothing of the time my attentive host lost in his business. I also made the acquaintance of his brother, W. Eastman, who is another of the same parent stock and nobility of character. I had the pleasure of being a companied by him the last day. Genial Mrs. Eastma who did everything in company with Auntie to make t stay the most comfortable, will forgive me if she shou find some particles of alder swamp soil on some of t carpets, as she insisted on my going everywhere w hunting boots on, and the latter were never a gem cleanliness. CHAS. F. BROCKEL

Arkansas Birds and Foxes.

ALMA, Ark., Oct. 25.—The outlook in western Arka sas for winter shooting is good, so far as quail and duc go. The past summer has been a very good one quail, and many coveys are seen in the fields and woo Ducks are coming in and when Jack Frost l stripped the leaves from the trees and killed the wee good shooting can be had anywhere in this part of State. Ducks on the lakes and streams are more plenti than for several years, while doves, yellowhammers a rabbits are almost as thick as the English sparrow. Squ rels are not so plentiful as last season, though I ha killed a number of good bags this fall.

There has been some fine fox hunting the past mo or two, and in company with some friends who en the sport, I have had some fine chases. Two weeks we started a red fox near a farm of mine about an h before daylight, one morning when there had been a r the previous evening, and with six hounds we ran him hours, as fine a race as I have ever listened to. He not leave the section of country where we started him, ran in and out of the farm many times, finally coming n A. W. Brown, who is an enthusiastic hunter, and s and killed the fox, thus ending the chase.

The coming into western Arkansas of the red fox driving out the grays, much to the regret of the lover the chase, as the reds are much harder to capture cover so much more ground in running that they sca the dogs so that nothing but the best of hounds are any value.

I have had some fine fishing this season, which I tell the FOREST AND STREAM family about this winter. J. E. LOUDO

Game in Broome County, N. Y.

CONKLIN, Broome County, N. Y., Oct. 28.—Gray sq rels were plenty here from Sept. 15 till Oct. 10, at work acorns. There are very few chestnuts or walnuts, beechnuts. Partridges are in moderate numbers h plenty were seen in Susquehanna county, Pa., slashi in nine days of scouting (without a gun) through sev of the northern townships. I put up more woodcoc one two-acre swale, isolated in locality, than I have for years. I shall not kill any nor put any gunner o the locality. Local ducks of different species have bec the Susquehanna River along here this season in g numbers. M.

Maine Moose.

NORCROSS, Me., Oct. 25.—*Editor Forest and Stre* I am just returning from a two weeks' hunting trip moose. Dr. Bashford Dean, of Columbia Universit with me. We have been very successful. We g moose on the first day, and another on the fourth We outfitted at Camp Eureka, Spencer Bros., Millino Carry. Our hunting was done up Sandy Stream, on slope of Katahdin. Our guides were William Reyn and Elmer Hale. We recommend them as absol trustworthy and reliable. Men, in fact, who know business thoroughly and who do it well.

WILLIAM H. AV

Maine Game.

READFIELD, Me., Oct. 27.—Woodcock are quite plent the full flight is now on. Ruffed grouse are sc Quite a few deer are reported; a fine one was shot Mr. Chas. Stevens, of Lowell, Mass., and some of local hunters have been equally fortunate. The small is indulging in squirrel shooting to his heart's con Our duck and snipe shooting was very poor this fall E. A.

Currituck Ducks.

CURRITUCK SOUND, Oct. 25.—Ducks are arriving day by the thousands—redheads, ruddys, black d mallards, teal, pintails, widgeon and all the other k except swan and canvasbacks. There certainly were more at this time in many years. Our season opens 10, and we are anxious to get at them.

MORE AN

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to ad them in FOREST AND STREAM.

A Pearl River Camp.—III

(*Continued from page 350.*)

TIRED though we were, sleep did not come at th invitation. Home and loved ones seemed so far and the woods so deep and full of the mysterious. talked a little in whispers, and tried to keep the ne tremor out of our voices as we explained to each the night noises that occasionally rang or sobbe of the depths of the woods.

The two younger boys finally dropped off to slee the thought of that large black object covered wit which had caused us such a fright when gathering effectually kept me wide awake. I tried again and to convince myself that it was nothing but a log or s but could not do so in the face of Walter's ass that it was covered with hair, and the additional fa the glimpse I had of it was not at all conducive to t or stump theory.

Over and over I turned the matter, trying to

some reasonable conclusion as to what manner of animal it could be, and why it lay still when we ran on it. The fire finally burned low, and as I did not wish to be deprived of its welcome light I crawled out to replenish it.

Here I was joined by Walter, who assured me that he had not slept at all, but like myself had been trying to solve the mystery of our fright. "Do you suppose it could have been a bear?" said he. This was just what I had supposed it to be a dozen times during my worry over the problem, but now encouraged by the firelight and company, I scouted the idea.

Every possible, and many impossible, theories we discussed, without arriving at any satisfactory conclusion, and then my companion advanced one that nearly made me fall in the fire.

"Perhaps it was a dead man," said he, with a start and a gasp.

I went cold all over. "But you said it was covered with coarse hair," I ventured.

"I thought it was, but when I fell only one hand touched him, and that may have been his hair."

"Him," "his," I thought. Good gracious, he feels sure of it.

Crowding closer up to the fire, and almost holding my breath, I fell to trembling violently and wondering what was behind me. The longing that came over me for home was not akin to pain, it was the real thing.

We sat silent for a few moments, and then Walter, whose back was toward the "thing," got up and came around to my side. "Let's wake the other boys," said he.

This proposition was debated at length, but finally abandoned, as we could see no advantage to be gained by adding the two younger boys to our counsel.

Another interval of silence ensued, broken by the hoot of an owl in a nearby tree, that nearly caused us to faint, and then Walter said: "Look here, I can't stand this. There is no use of our trying to sleep, and we will be half-dead if we sit here until morning. Let's go see what it is right now."

A proposal to go jump in the river would have been more to my liking. I offered every objection I could think of, except the real one—that I was afraid—even going so far as to urge that we ought not to leave the other boys alone, but nothing I could say had any influence with my companion, in the way of changing his determination.

When it finally came to the point of admitting that I did not dare go, or else going, I gave in. The fear of being thought afraid was simply greater than the fear of danger.

Walter took the revolver and our lantern, while I carried the big gun. I debated the question in my mind, as to which gun to carry, realizing that in case a retreat was in order, the heavy weapon would interfere very much with my movements, but as it would be much more effective than the lighter weapon, I finally concluded to take it, and in case of a condition arising warranting flight, abandon it altogether. The trail made by the limb was plain, and down this we went with as bold a front as we could put on. I was scared almost to death, and had every reason to believe that my companion was in the same condition.

We were really being very brave, if we had but known it, but we did not. What we did know was that it was very eerie, dark, and gruesome, and we heartily wished ourselves well out of it. Every stick that broke underfoot caused a tremor through the entire company, and when a bat, attracted by our light, swished across our faces, we swallowed hard and gasped for breath.

On we went, following the plain trail made by the limb we had dragged in for firewood, until we came at last in sight of the object of our quest, a long, dark body, lying across the path.

It looked as though it might be either a bear or man, and to our excited minds was an awful spectacle.

Walter saw it first, and with a startled "There!" thrust forward the lantern as far as he could reach, holding his weapon presented in the other hand. I swung the big gun up to ready, and in spite of its weight, held it there, with the muzzle jerking about as though it was a featherweight.

We stood thus for a moment, and then in a whisper I said: "I can't hold her up any longer; let's both shoot and run."

"No, wait until it moves," said he.

For another trying moment I stood holding that big, heavy gun, every muscle on a terrible strain, and then my indignation overcame my fear and I protested:

"How am I going to hold up this old cannon 'til it moves, especially if it is dead, as you think? Here, give me the pistol and you take the gun awhile."

This Walter declined to do, and emboldened by the fact that no movement could be detected, we lowered our weapons and moved a little nearer. Waiting a moment and there still being no movement, we crept yet closer, and leaning forward with the light extended as far as we could reach, saw plainly the object of our awful fright.

It was a large, black hog, and stone dead. What looked like a bullet hole in the head back of the ear explained its death, and a mark in the ear showed it to be identified property.

So thankful were we that the mystery was solved, and the danger past, that we hurried back to camp and went to bed without so much as waking the other boys to tell them how brave we had been.

Will and Jim roused up early next morning, and each taking one of the guns, and holding as close over our heads as possible, awakened us with a double salute. In no humor for such pleasantry, Walter promptly knocked Jim down and sat on him, while I chased Will into the woods. War was not to the liking of any of us, and a truce was soon declared, and all hands repaired to the lake for a swim, Walter and I frequently referring in a mysterious manner to our adventure of the night before.

Our swim over, and the younger boys being worked up to the proper pitch of excited curiosity, we detailed our adventure and took them to see the hog.

"That is my hog," said Will. "I killed it yesterday when they were looting the camp, but I didn't know it then, as they all ran off." This was probably true, though it had not occurred to us before, not having a very exalted opinion of his marksmanship, and he not having known it.

Hunger soon drove other matters out of our minds, and we proceeded to canvas the question of breakfast. Bacon and meal was the entire contents of our larder, and we did not know how to make corn bread.

Fish were to be had for the catching, but fishing was no fun on an empty stomach, with hunger gnawing. We finally fried some bacon, and made out to eat a bit, but it was not very palatable without bread.

Immediately after breakfast we resumed fishing, and soon had a goodly lot of bream in our fish box. While paddling back to the landing we discussed the question of food, which was now a very serious one. Forgetting the fact that we were enjoying exactly the kind of trip that we first planned, we proceeded to seriously consider sending our foragers for bread and other civilized food.

"We better go home than starve," said Will, who had only managed to dispose of one small piece of bacon, and was now feeling the pangs of hunger. This heresy was promptly rebuked, and we decided that even if we did suffer hunger, we would stick it out for the week.

"Why not eat my hog?" said Will. "He is fat, and fresh pork is good." This semeed not altogether a bad suggestion, and was the subject of favorable discussion until Walter raised the objection that it would be stealing to take the hog, as it bore a mark.

Our condition was not yet sufficiently desperate to warrant our stealing a hog, but further discussion brought forth the argument that the hog was dead, and if not used by us would be a waste, and benefit no one.

We finally concluded to go to camp, eat an early fish dinner, and then butcher the hog and use the meat.

"Fish are sure good to eat," said Will, as he cleaned the bones of his fourth, "but I am glad we will have nice fresh pork chops for supper."

We knew that hogs were usually scalded and scraped, but concluded to dispense with it in this case, so after dinner we started in with our knives to work up our meat. Every fellow had a theory as to the proper way, which was tried in turn, but none of them seemed practical.

At the end of an hour's hard work, perspiring and dirty, we adjourned in a body to the lake to wash up, leaving a horribly mutilated carcass, hacked and torn, from which we had tried in vain to get out, first, chops; second, tenderloin; third, a ham; fourth, pigs' feet, and then anything that was meat, all in vain.

Thoroughly disgusted, we heartily indorsed Walter's positive statement, made as he scrubbed his hands and arms with sand, to this effect: "I wouldn't eat a piece of that blamed hog if it was prepared by Delmonico and served on solid silver."

After resting for some time, we tied a bit of rope to the least mutilated hind foot of the carcass, and by hard work dragged it a safe and comfortable distance from our camp down into the swamp, where we left it, fervently hoping that the hog incident was finally closed.

Returning to camp, we got out our minnow seine and prepared to catch some minnows, as we had concluded that if our diet was to be a fish diet strictly, we might at least vary the species.

White perch, goggle eye and trout could be taken with minnow bait, and we wanted to try them. What we called trout were really black bass, but that was the name they held locally, and we knew no better then.

Getting into the boat we paddled down to the river, a distance of about one-quarter of a mile, and by mid-afternoon were back with a nice bucket of minnows, ready for business.

LEWIS HOPKINS.

[TO BE CONTINUED.]

Toddy Pond.

MACOMB, Ill., Oct. 18.—*Editor Forest and Stream:* Having received an invitation from Dr. W. S. Blaisdell and family of Punxsutawney, Pa., to join them on a camping-out visit at East Orland, Maine, I set out for that point, going by way of Chicago, Boston and Bangor. Stopping over in Bangor, I called on my friend Manly Hardy, who lives in Brewer, across the Penobscot River. Mr. Hardy is getting along in years, but enjoys telling a good hunting story just the same as he did when a young man. No man in Maine knows more about the hunting ground in the State than he. He has a large building filled with stuffed birds and animals from almost every clime. It would take a person a week to look over and study the different varieties of these birds, each one labeled in perfect order with note of the part of the country it came from. Any person that loves nature could not spend a day with more pleasure than here. I took the Bangor and Bucksport Railroad and arrived at Bucksport, where I found a carriage waiting for me to take me to East Orland, where I went into camp with my son and family. The next morning I took a walk over the old farm, where I first saw the light of day. One-half a century had brought many changes. The old house that I was born in was gone, but the three juniper and an ash tree I planted over fifty-five years ago are still standing in front of where the house stood. The old red schoolhouse had disappeared from the wear of time, but a new one stood on the same spot of ground where the old one stood eighty years ago. The town was quite a business place many years ago. The sawmills are about all idle now for want of timber, that has disappeared by the ravages of the ax. These mills are on what is called Toddy Pond. The pond got its name some 150 years ago. Two men were crossing it, one had a jug of molasses and the other had a jug of rum, and they cut a hole in the ice and let the water in. They turned in the rum and molasses and both took a drink! This pond has been known as Toddy Pond ever since.

Our camp, once owned and built by Mr. Bell, of Portland, Conn., is now owned by his brother, and is near this pond o nthe side of Mason's Mountain. It is located among the pine trees and has a beautiful view overlooking the pond, which is nine miles long. On the highest point of the mountain one can see Belfast Bay and Castine Bay, where several battles were fought in the early settlement of that country. Looking in another direction one can see the Penobscot River and steamers and vessels passing and repassing at all times of the day. Mt. Desert can be seen very plainly from this hill.

I shall never forget my hunt on Mason's Mountain in 1856 with W. S. Hanscom, of Portsmouth Navy Yard, which terminated so unfortunately. We were hunting on top of this hill in a thick young growth, when a rabbit jumped up, and I shot the rabbit dead, but one of the buckshot struck Mr. Hanscom in the leg and felled him to the ground. He carried this shot in his leg till he died on the retired list.

At the foot of this mountain there is a beautiful sheet of clear water called Craig's Pond, and here are the finest trout I ever saw, but very hard to catch. These trout will weigh from three to five pounds. There is a running stream out of this pond into Great Pond, and here the Government Craig's Pond Fish Hatchery is located on this stream. It is a beautiful place and well adapted for the business. Mr. Atkins, a pleasant gentleman, has charge of the hatchery and takes great pains in showing people the workings of it. There are several kinds of trout hatched here, among them is the rainbow trout from Colorado. The principal fish hatched here is the landlocked salmon. Over 22,000 of them have been put into Toddy Pond, where they are doing nicely. Some of them are three or four years old, and will weigh from one and a half to two pounds. They will spawn when four years old, and they will multiply very fast. By the time they are seven or eight years old they will weigh from eight to ten pounds. In Sebec Lake, Maine, they have caught specimens that would weigh from ten to twenty pounds.

I went out in a boat with John Huckens on Toddy Pond and we caught nineteen with fish worms. We caught them in seventy-five feet of water, but fished about fifty feet. They will not bite well on a cloudy day, but will take hold well on a sunshiny day after ten o'clock A. M. till two o'clock P. M. There were several other parties fishing the day that I was there, and among them was Miss R. M. Leighton, a typewriter for a law firm in Portland, Maine. She caught quite a number and handled the line the best I ever saw a woman. I hear she is fully as handy with the rifle, as she shot two fine buck deer last fall.

On the last Sunday in camp Dr. W. S. Blaisdell gave a banquet to his friends, and seventeen sat down to dinner. The dinner was a grand one, and probably there will never be such a party in camp there again. East Orland is a nice little village, settled by good people, and they are always glad to see people come among them from abroad. There is quite a number of camps and summer houses built there, mostly by people from Connecticut. They make the place quite lively through the summer months, and the residents are very sorry to see them return to their homes in the fall. The Rev. Mr. Rafrety, of Portland, Conn., has proved himself a salmon fisherman as well as a pulpit orator, for I saw him and Mr. Bell with a fine string of sixteen. The deer and ruffed grouse are quite plentiful. The deer often come into the fields and destroy the crops, and a gentleman wrote me the other day that they had eaten up his beans. I hope to be there again another summer and try my hand again at salmon fishing—the most beautiful of all fish.

W. O. BLAISDELL.

Salmon and Sea Lions.

In the current Contemporary Review, Woods Hutchinson contributes some experiences on the Northwest Coast having a bearing on the salmon—sea lion question which has been discussed in these columns.

ABOUT a mile up the coast from our camp a couple of fishermen had established a little hut for the purpose of killing (for their fat and hides) the sea-lions, which abound on the rocks for which we were bound. Their boat was a fine, staunch, old sea-going craft, the gig of a whaler, requiring at least six men to row her and ten to launch her, as we found to our sorrow. There was no lack of game, for directly in front of their little cabin and scarcely half a mile off shore the innermost group of rocky islands, which we hoped to visit, were covered with the great brown bodies of the sea-lions and their little, shiny black cubs. They are not aggressive animals at best, and at that distance the old ones looked like great round sticks of cord wood and the youngsters like little black caterpillars. They simply carpeted the lower ledges, looking almost as if piled upon one another like driftwood after a storm, but as they receded from the water their ranks grew thinner and thinner, until finally the topmost ledges of the rock-reef were occupied by three or four magnificent old bulls, the self-constituted sentinels and defenders of the herd. Their roaring was both cavernous and continuous and could be plainly heard all up and down the coast whenever the surf would moderate, but I am reluctantly compelled to admit that there was little in any way impressive about it. It did not in the least remind one of the "great seal roar that beats off shore above the loudest gale." It was much more accurately described by the light-keeper, of agricultural antecedents, who declared that he could hardly sleep for hearing them "a gruntin' and a fitin' all night long, like a passel o' big hawks under a barn." What the meaning of it all might be was hard to conjecture, for the mating arrangements were long since settled and there was absolutely no fighting going on. Nor were the songs intended as danger signals, for, with the exception of an occasional plunge by a single member for a cool sea bath and a little scurry after a cuttlefish, there was almost no movement going on in the herd. They were lying there in the sunshine, like so many logs of drift wood, only at intervals lifting their heads to join in the extraordinary chorus. Whether for some imaginary benefit to the crowd or merely for the pleasure of hearing their own voices it would be impossible to say.

The more I see of animals, the more firmly I am convinced that man for once has been grossly slandered when accused of being the only animal which talks purely for the pleasure of hearing its own voice. Those who moralize upon the vain loquacity of men and the dignified silence of animals usually know very little about animals. The motto of the whole animal world, man included, seems to be: "What is the use of having a voice if you can't use it?" Nearly every animal of gregarious habits and the slightest pretension to any

social gifts spends the greater part of the time in which he is in the society of his fellows in some form of conversation, or at least vocal exercise. An afternoon tea or a Salvation Army testimony meeting is not by any means the only occasion upon which a continuous flow of remarks is considered an absolute necessity. A flock of rooks, a band of sparrows, a drove of elk, nay, a dignified senate of sea-lions or congress of seals, are all imbued with the same idea. Even cattle and sheep will keep up a constant interchange of sounds, excepting at such times as their mouths are actually engaged otherwise in the process of eating and drinking. Man is probably the one animal that talks while he is eating, but with that exception he is not a whit more loquacious than many of his blood relatives. Not only is this true of talking as a means of social intercourse, but I have also known a great variety of animals, including elk, bear and buffalo, as well as birds innumerable, who would keep up an almost incessant conversational soliloquy even when entirely separated from the rest of their kind. The moping owl is seized with fits of this description.

The presence of these sea-lion hunters brings under notice an interesting and hotly disputed question as to the natural dietary of these great beasts. On the one side are ranged the fishermen and salmon canners; on the other the scientists. The former hotly denounce the sea-lions as among the deadliest foes of the salmon and other fish, alleging that, not content with capturing them in open chase, they will hang about the gill nets spread in the mouths of the rivers, when the chinook are running up to their spawning places, and tear the thirty-pound "silver sides" right out of the meshes of the net—with what effects upon the latter fabric may be readily imagined. They allege that the sea-lions simply swarm about the mouths of the rivers, when the salmon are running, like deer about a salt-lick, and that one sea-lion will destroy hundreds of salmon in a short season. Not only do they kill and devour them, but they are also said to rush furiously in among the ranks of the fish and snatch and tear in every direction, burying their teeth in the flesh, or eating a single mouthful of a salmon and then dashing for another, killing for the mere lust of slaughter like a wolf among sheep. For a long time no one dreamed of challenging this assertion, and the sea-lion was put down, like Artemus Ward's Indian, as "pizen wherever found." But a few years ago a biologist was appointed by one of the State institutions to investigate the question, which he proceeded to do by securing the bodies of as many sea-lions as possible and examining the contents of their stomachs. A number of stomachs of the creatures were also secured by fishermen and others and sent in with their contents for examination. The result was somewhat startling, for in no single instance were fish bones or scales to be found either in the stomachs or in the intestines of these great brutes, while an abundant supply of the remains of cuttlefish and traces of shrimps, jelly-fish, etc., were discovered. Whereupon the distinguished scientific gentleman was compelled to state that, so far as he could discover, the alleged atrocities perpetrated by the sea-lion upon salmon and other fish were not supported by sufficient evidence. This naturally annoyed the fishermen, as nobody likes to be flatly contradicted, even when he is told that an imaginary enemy of his is really doing him no harm whatever; and as they were agitating for a bounty to be placed upon the heads of sea-lions, as enemies of the State, they demanded a further investigation. Another expert was thereupon set to work and reported precisely the same results, only the "pens" of cuttlefish being found in the alimentary canal, instead of bones and scales.

In spite of this, however, the fishermen and cannerymen having a considerable number of votes and the scientists only one or two, the legislature was induced to pass a bill granting a bounty of $2.50 for the scalp or other evidence of the killing of a sea-lion. Whereupon our fishermen aforesaid had taken advantage of the slack season in the salmon fishery to embark on their little lion-hunting expedition. Unluckily for our friends Solomon and Indian Joe, by a base trick of fate or a special dispensation of providence (according as one sides with the scientists or the fishermen) it was discovered after the bounty bill had been passed that no funds had been provided to pay the scalp fees, but as this did not come to light until the first batch of scalps was actually presented, their enterprise was under full way before its hopes were dashed to the ground. The naturalist's sneaking fondness for biology (of which he declares that man and all his works form only one small chapter) was unexpectedly stirred by the problem, into which he suddenly plunged, if not up to the eyes at least up to the elbows. A number of gruesome and fragrant carcasses, victims of the hunters' rifles, strewed the beach, and equipped with a large hunting knife he proceeded to dispute with the gulls for the possession of these entertaining pieces of carrion. In spite of the abundant supply of excellent, if rather rancid, oil which his investigations provided, the flame of his enthusiasm waned lower and lower, after each ghastly encounter, until finally after two days, during which not only everything which he handled or ate or looked at but even his very dreams fairly reeked with train oil, he announced with a snort of disgust that the rest of the question might settle itself, so far as he was concerned. One small incidental advantage derived from the process was that his hands and boots were both practically waterproof and protected from "salt-chap" during the remainder of his stay.

However, the five huge paunches which he did succeed in quarrying out of the cavernous interiors of these great hulks, weighing from 1,500 to 2,000 pounds, absolutely confirmed the reports of the scientists. Not one of them contained the faintest trace of any form of fish food, nearly all being occupied by a thick, reddish fluid, which closer investigation showed to be a purée of shrimps, and from one to a dozen "pens" (or chitinous plates from the dorsal mantle) of cuttlefish. After careful collection and sifting of the evidence of a number of fishermen he was able to arrive at a conclusion which was satisfactory, at least, to himself. His decision was a somewhat Delphic one, that both parties were right, as their apparently conflicting results were obtained at different seasons of the year. The only season at which the sea-lions can be captured in any considerable numbers, or at which their bodies can be obtained for study, is during their breeding period, from May to August, when they collect upon the reefs and rocky islands in swarms and herds. Now, during this season (as he fishermen promptly and without any leading on his part informed him) they are like their cousins, the fur seals, eating nothing at all or confining themselves to cuttlefish, jellyfish, hydroids, shrimps and such exceedingly small deer as can be captured in the open sea; just as the findings of the scientists from their stomach contents indicate. As soon, however, as the autumn sets in and the fall run of salmon begins they disappear from these breeding places and begin to frequent the mouths of rivers and smaller streams, which are packed with the masses of the salmon. There seems no reason to doubt the veracity of the fishermen's testimony in this regard, as salmon have been found with large pieces bitten out of them, and these rovers of the sea have also been seen dashing in among the frightened salmon, coming up to the surface with a great "steel-back" between their teeth, tossing him into the air and catching him as he falls with a resounding snap, just like a greyhound with a hare. Until a sea-lion can be caught, during either the fall or the spring run of salmon, in one of their chosen beats, the question must remain unsettled, with the burden of proof on the side of the fishermen. So far as analogy is concerned, their near cousins, the seals, are well known to be as destructive to fish of every description as terriers are to rats, and may be seen driving or herding schools of mackerel, like sheep dogs their flocks, and chasing them up into narrow and shallow inlets of the bay, where they can be secured by the rest of the waiting pack. On the other hand there is no inherent improbability in such behemoths supporting life entirely upon a thin and unsubstantial diet like shrimps and cuttlefish. Those mastodons of the ocean, the whales, live exclusively upon such food materials, and even include infusoria and tiny hydroids as well.

Natural Preservation of Fishes.

From the manuscript of a book on "General Biology," by Prof. H. A. Surface, Department of Zoology, the Pennsylvania State College.

Fishes have greater economic value than all other classes of so-called "cold blooded" animals combined. They are beyond doubt the best flesh food that mankind can eat, and as a consequence serve as food for all nations. Statistics show that those nations, like the Scotch and South Sea Islanders, who eat fish as their chief flesh food and avoid beef, are most exempt from tuberculosis and other diseases and parasites that are conveyed to man by infested beef.

Years ago nearly every stream in this State yielded fresh fish in abundance for the masses, and this formed a common element for the food of the working man. Today most of the streams are barren, and fresh fish is a delicacy found upon the table of the wealthy man only. Fishing as an industry or for recreation is steadily declining. The reduction of our native fishes is due to the combined influence of their natural enemies and man, but the effects of the latter are by far the most destructive in most places. Among their natural enemies are internal and external parasites, aquatic insects, hags and lampreys, other fishes, water dogs or mud puppies, and other amphibians, water snakes and turtles, certain aquatic and semi-aquatic birds, such as herons, divers, loons, mergansers, kingfishers andospreys, and certain mammals, like the otter, mink, raccoon, muskrat, wildcat, etc.

The indirect effects of the actions of mankind have been far more destructive to fish life than have the effects of his direct attacks upon the finny tribe. The mere taking of fishes from the water would not exterminate the race. Among the agencies that are effecting their wholesale destruction are the following: 1. The pollution of streams by poisonous waters from mines, factories, sewers, etc. 2. Dumping into water such material as sawdust, ashes, screenings, etc., that cover the fishes' spawning beds and fill their gills. 3. Keeping the water constantly roily by certain kinds of mining operations, factories, etc., and by rooting of carp, which were introduced by man. 4. Logging or floating large logs down streams and tearing up spawning beds, often at a time when many eggs are thus destroyed. 5. Clearing away forests and natural vegetation, which causes the water to be warmer and shallower or less abundant and more intermittent in flow than formerly. 6. Draining swamps, which not only reduces the water supply, but also destroys the minute food material for the young fishes. 7. Clearing out streams and clearing away débris that furnishes natural places for their safe concealment and reproduction. 8. Building canals and irrigating ditches and otherwise turning the water out of its natural channel. 9. Building dams, which prevent the migrations of the anadromous fishes, like the salmon and the herring. 10. Wanton destruction in capturing fish, as by dynamite, and the accidental and careless killing of great numbers of small individuals when hauling nets.

All of these are causes over which mankind has control to some extent and their practical remedies are being sought and made known by our State and United States Fish Commissions, which deserve the strongest support of every citizen and all possible aid by legislators.

Dynamiters in Arkansas.

ALMA, Ark., Oct. 25.—*Editor Forest and Stream:* I have had an opportunity the past summer to see what destruction is wrought by the dastards who are mean enough to use dynamite in a stream to kill fish. The headwaters of White River in Washington county, Ark., afford good bass fishing and many have been the gamy black bass I have lured from the shady pools along these streams. But in June some parties killed everything in the shape of fish in the West Fork of White River; but so careful were they in their work, that it is impossible to detect them, and while I am sure I know who it is, I have no legal proof. Under the laws of Arkansas it is only a misdemeanor to kill fish with explosives. But I have prepared, and when the General Assembly of the State meets in January, 1903, am going to have introduced a bill making it a felony, punishable by imprisonment in the penitentiary for not less than two nor more than ten years, and to pay a fine of not less than one hundred dollars, one-half of the fine to go to the informer who gives testimony securing a conviction, and the other half to go to the school fund of the State, and upon failure to pay the fine the defendant to serve it out in the penitentiary at one dollar per day. This may seem a rather drastic punishment, but I think this to be one of the worst crimes against property that can be committed. In order to protect the game and fish of the State, the Legislature has declared them to be the property of the State; and now I think it the duty of the lawmakers to enact laws that will protect them, and I propose to see that at least the Legislature has a chance to vote on this proposition. I would be glad to have the views of other sportsmen along this line. J. E. LOUDON.

Hungry and Tame.

LAKE FOREST, Ill.—Several weeks ago FOREST AND STREAM contained a little article concerning the feeding of fish while confined in a fish box. The writer was somewhat surprised to note that a fish endeavored to swallow another almost half its size while so confined. He wanted to know if others had noticed similar cases. In answer I would like to relate a little experience I had last summer.

During the month of August the fishing at Lake Wabesa, Wis., was not very good, and an angler was generally kept busy all day providing a mess for dinner. One evening in particular we had unusually bad luck. One of the little boys at our camp caught a small perch some nine inches long, after faithfully fishing all evening. He put this fish on a stringer off our pier. Next morning I saw the little fellow, took pity on him, and removed him from the stringer with the intention of throwing him into the lake. Just then I noticed several dead minnows in my minnow box, and got the happy idea of providing the perch with breakfast before releasing him. I placed one of the dead minnows part way into the perch's mouth, while I held him several feet above the water. Imagine my surprise to see that the perch was not at all backward, but swallowed and enjoyed the minnow with every indication of pleasure. Three other minnows followed in rapid succession. The last one I placed on my hand, just touching the nose of the perch, which wiggled until the minnow was safely stowed away.

Are perch in the habit of getting familiar on such short acquaintance? E. J. R.

Canine Elegies and Epitaphs.

XXVII.—Hector.

THE correspondent who sends this writes: "The author is now Chief Justice of the Connecticut Supreme Court. The dog was a setter that I owned—a good all-round dog, and by long odds the best quail dog I ever saw.—H."

Here lie the relics of a faithful friend
Upon whose virtues it were vain to dwell.
He sleeps the sleep that never knows an end,
Amid the woods and fields he loved so well.

The fields, the woods, the hills he joyed to roam
Lie round him yet; he is like them a part
Of Nature that has kindly called him home,
To sleep forever near to Nature's heart.

"A Vermont Mode."

PHILADELPHIA, Pa.—In FOREST AND STREAM of Nov. 1 there is a letter on fox hunting, by W. W. Brown. While seriously intended as an account of good sport, the methods employed placed it well outside the domain of sport, as the term is understood by sportsmen. The ordinary New England method of "fox hunting" has long been a matter of debate pro and con. As a method of fox hunting, it is not fox hunting at all in the true sense. Fox hunting in its true sense is a pursuit, the fox being the pursued and the dogs the pursuers. The fox hunters follow afoot, horseback or in carriages, as they please. The New Englander employs a hound or two instead of pack, pickets the fox's runways with a number of his friends armed with shotguns, who wait patiently till the fox is driven to them, whereupon, thus ambushed, he is potted with a load of buckshot, the remains are collected and constitute a trophy, and the sum total of activity is termed fox hunting. Now, New Englanders have a

right to hunt their foxes in their own way, but they should employ some term which truly designates that peculiar way. Call it fox potting, or shotgun practice on foxes, or, if the foxes are pests, call it vermin extermination, but pray do not call it fox hunting, a term which has honored traditions, eminently honorable methods, and methods which are so distinctive that they are entirely unlike. But be the New England methods as wrong as they may, the fox slaughter, described under the caption "A Vermont Mode," out-Herods Herod. The essentials of it are two hounds, two "hunters," one a "crack fox hunter," two "favorite stands," a harried fox, a woodchuck hole, crowbar and shovel, digging for the fox, smoking him out, pulling him out, giving him to the dogs to shake, and "the pelt, an extra fine one, was presented to the cabin by Mr. Currie, and will occupy a place of honor over the stone fireplace." The fox, thus brought to hand and to death, is designated as a "trophy." It was truly a "mode." At the conclusion the writer sagely remarks: "There are two interesting facts to note, first, a fox driven to earth by hounds will suffocate rather than jump out to the dogs." How strange! How inconsiderate on the part of the fox to deprive the hunters of a crowning pleasure. But New England fox potting seems to have offshoots of peculiar methods, of which the "Vermont mode" may be an advance and possibly in its effectiveness and novelty an improvement.

ALBERT CONVERSE.

Clay and Benton, and a Basket of Puppies.

SIXTY or more years ago I heard Joshua R. Giddings relate the following stories relating to those two eminent statesmen:

Clay, as is well known, was a great favorite with young boys, and many of the newsboys and bootblacks in Washington were on intimate terms with him. He was one day approached by a young lad carrying a heavy covered basket. "What have you there, Jimmie?" he asked. "Puppies," he replied; "three of them, and I want to sell you one. You can have your pick of 'em for one dollar." "I think Mrs. Clay would like that spotted fellow," Clay replied. "What are their politics?" The boy was aware of his political belief, and promptly replied, "They are good Whigs, and their mother is, too." "Well, here is a dollar; take him to Mrs. Clay and tell her to give you a good dinner."

Three days later Clay and Benton were walking down the same street discussing as usual the "specie question." "Say, Tom," says Clay, "there is a boy coming who will ask you to buy a young dog. Whether you purchase or not, be sure and ask him about the puppies' politics." Benton said to the boy: "I guess that my girl Jessie does need a puppy, or thinks that she does, but I wish to be very careful about buying. What politics have the two young dogs?" The lad was also aware of the political belief of Benton, and assured him that they were good Democrats.

"What! What!" says Clay; "you told me that they were Whigs." "They were then," says Jimmie, "but now they have their eyes opened."

Benton was so pleased with the boy's reply that he gave him an extra dollar, and an order on Jessie for a good dinner.—Jay B. Miller in Springfield Republican.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1902, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, $50.00.
Second prize, $30.00.
Third prize, $20.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1902.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

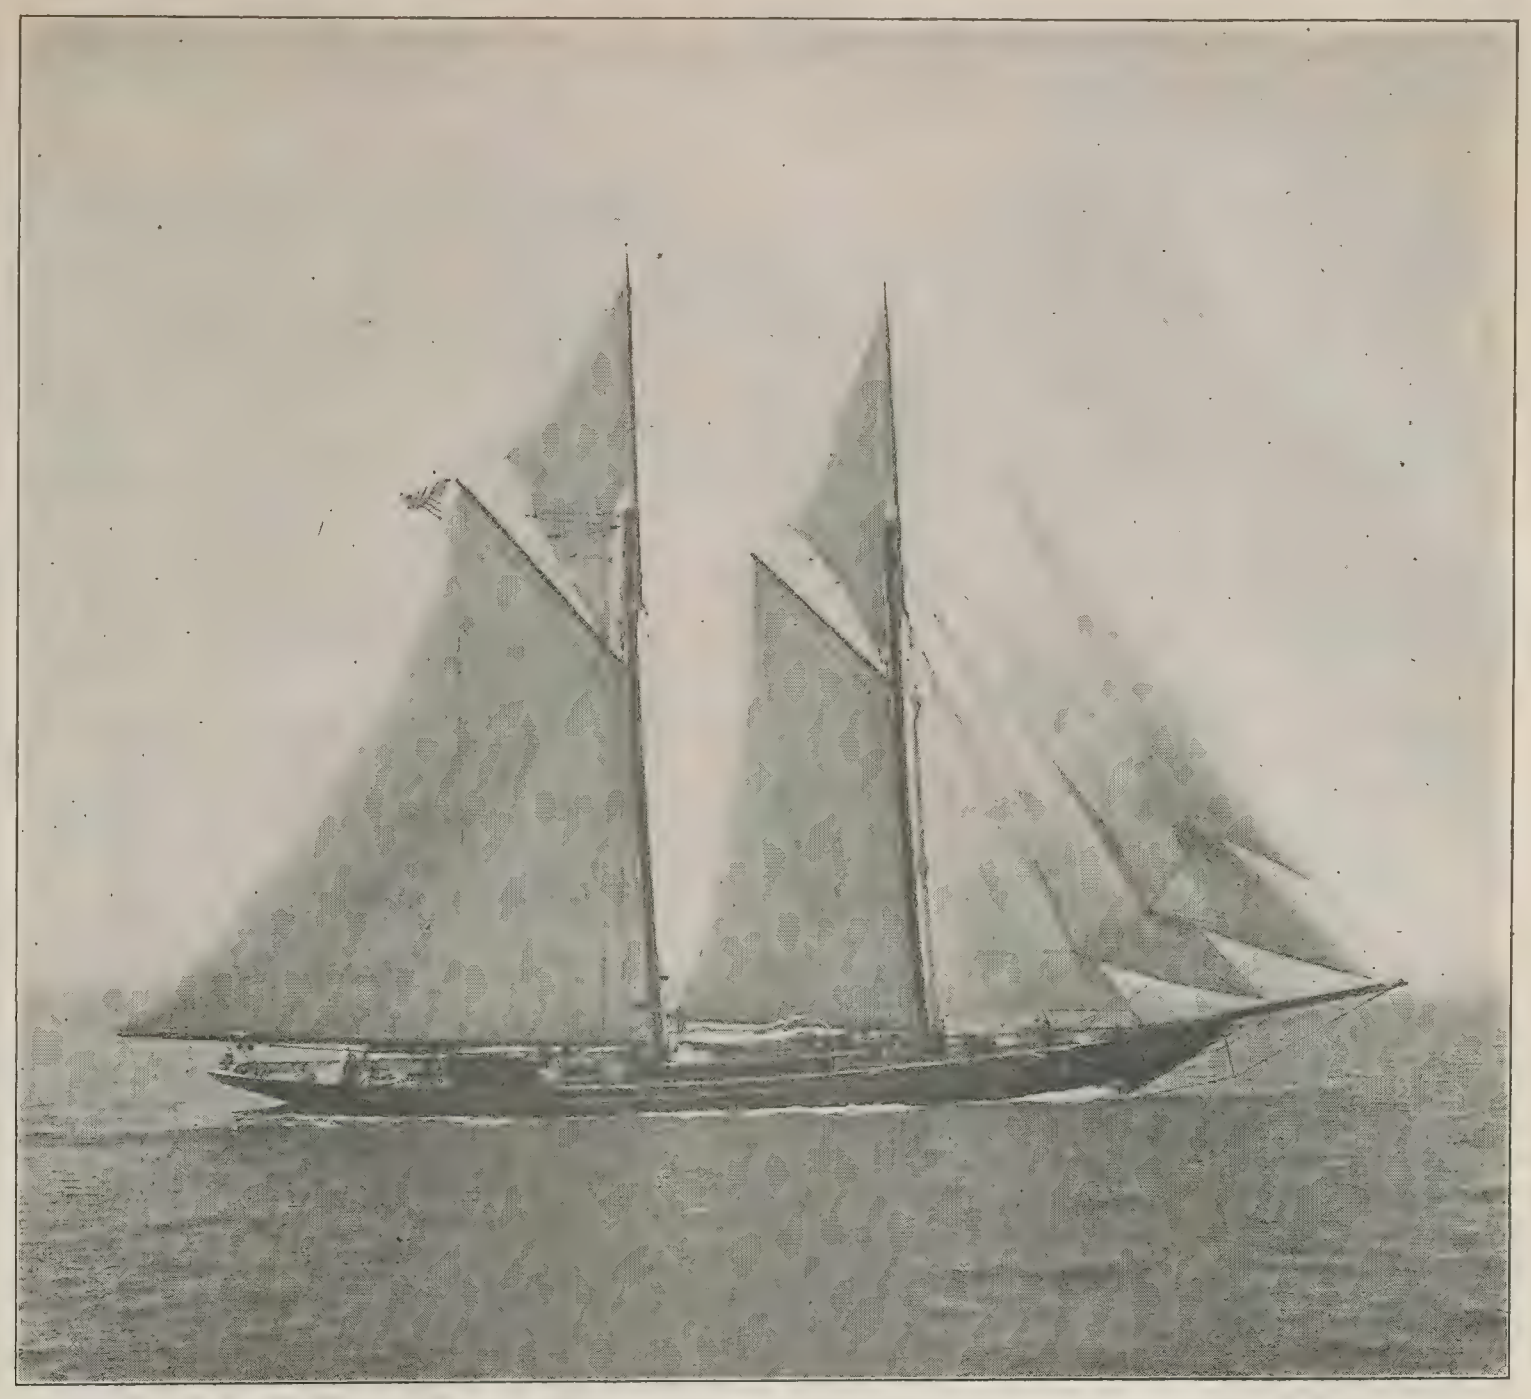
3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. An outline chart suitable for reproduction, showing the course taken, must accompany each article. When possible, articles should be accompanied by amateur photographs taken on the cruise, including one of the boat. Good photographs will be considered in making the awards.

5. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York city, on or before Nov. 15, 1902.

Mr. T. C. Zerega has very kindly consented to act as judge and to make the awards.

The following sales have been made through the agency of Mr. Stanley M. Seaman: 35ft. sloop Narcissus, owned by Mr. Adolph Erdman, New York city, and the 30ft. sloop Duchess, for Mr. L. D. Huntington, Jr., New Rochelle.



GENESEE.
Designed by A. Cary Smith & Barbey for James S. Watson, 1900. Photo by James Burton, New York.

Cruise of the Schooner Genesee.

THE schooner Genesee, which arrived in New York on Sept. 26, after an extended European cruise, is now at Tebo's, South Brooklyn, where she has been put out of commission. Genesee was designed by Messrs. A. Cary Smith & Barbey, and was built by Mr. Lewis Nixon at Elizabethport, N. J., in 1900, for Mr. James Sibley Watson, of Rochester. Genesee is 148ft. over all, 110ft. waterline, 27ft. breadth and 13ft. 6in. draft. Her power is supplied with two Almy boilers of 100 horse-power, and she carries twenty tons of coal. A cabin plan and a complete description of Genesee appeared in FOREST AND STREAM of Dec. 22, 1900. The photograph of the boat reproduced in this issue shows her under cruising canvas. Genesee is an enlarged Lasca, one of Mr. Smith's earlier productions, a boat of 90ft. waterline length, that proved to be a very fast and able craft.

Genesee's recent cruise was an interesting one. She left New York on May 1 of this year, and her log for the trip across follows:

May 1, 1902—Scotland Lightship abeam at half-past two o'clock; 155 miles.
May 2—Moderate N.E. wind; 181 miles.
May 3—Variable northerly winds; 179 miles.
May 4—Strong N.N.E. wind, with choppy head sea; 186 miles.
May 5—Fresh S.E. wind; heavy sea; 226 miles.
May 6—Moderate gale; heavy sea; 237 miles.
May 7—Strong gale; hove to 17 hours; 84 miles.
May 8—Wind and sea moderating; winds N.N.W.; 263 miles.
May 9—Very light N.W. wind; sighted the Navahoe; 180 miles.
May 10—Light wind and calm; 93 miles.
May 11—Light southerly wind and calm; 163 miles.
May 12—Light southerly wind and 12 hours' calm; 73 miles.
May 13—Same, with eight hours' calm.
May 14—Light westerly winds; 157 miles.
May 15—Fresh westerly winds; 241 miles.
May 16—Fresh gale from N.W.; under reduced canvas; 236 miles.
May 17—Strong N.W. wind; close reefed mainsail; 227 miles.
May 18—Same conditions; 240 miles.
May 19—Same conditions; 240 miles.
May 20—Strong northerly wind and choppy head sea; 156 miles.
May 21—Same conditions; arrived mouth of Elbe River at twenty minutes past two P. M.
May 22—Went through canal under steam and arrived at Kiel at eight P. M.

After staying for the big regattas at Kiel, she proceeded to the Baltic, and there visited Stockholm, Calmar, Wesby and other ports. Before going to the coast of Norway, stops were made at Copenhagen, Goteborg and Christiania.

In the Baltic Sea and the North Sea Genesee covered 3,200 miles, but only 700 miles of this distance was under sail, the balance of the trip was made when under steam.

On Aug. 20 Genesee sailed from Bergen, Norway, for Inverness, Scotland. She made this run under canvas alone, and arrived there on Aug. 22. Genesee passed through the Caledonian Canal on the trip from Inverness to Oban, where she arrived on Aug. 31. After reaching Oban the vessel was put in shape for the voyage home. On the morning of Sept. 9, Genesee sailed from Oban for New York, where she arrived on Sept. 26. The log of the passage home is as follows:

Sept. 10—Fresh northerly winds; 250 miles.
Sept. 11—Variable northerly winds; 237 miles.
Sept. 12—Moderate N.N.W. winds; 210 miles.
Sept. 13—Light N.N.W. winds; 180 miles.
Sept. 14—Variable and light; 120 miles.
Sept. 15—Light air and calm; 70 miles.
Sept. 16—Same conditions; 18 hours of calm; 55 miles.
Sept. 17—Same conditions; 65 miles.
Sept. 18—Fresh northerly winds; 201 miles.
Sept. 19—Fresh N.N.W. winds; 232 miles.
Sept. 20—Light N.N.W. wind; 138 miles.
Sept. 21—Light easterly wind; 232 miles.
Sept. 22—Light S.E. wind; 166 miles.
Sept. 23—Light northerly winds; 127 miles.
Sept. 24—Variable westerly winds; 132 miles.
Sept. 25—Northerly and fresh easterly winds; 248 miles.
Sept. 26—Fresh easterly and S.E. winds; 230 miles.

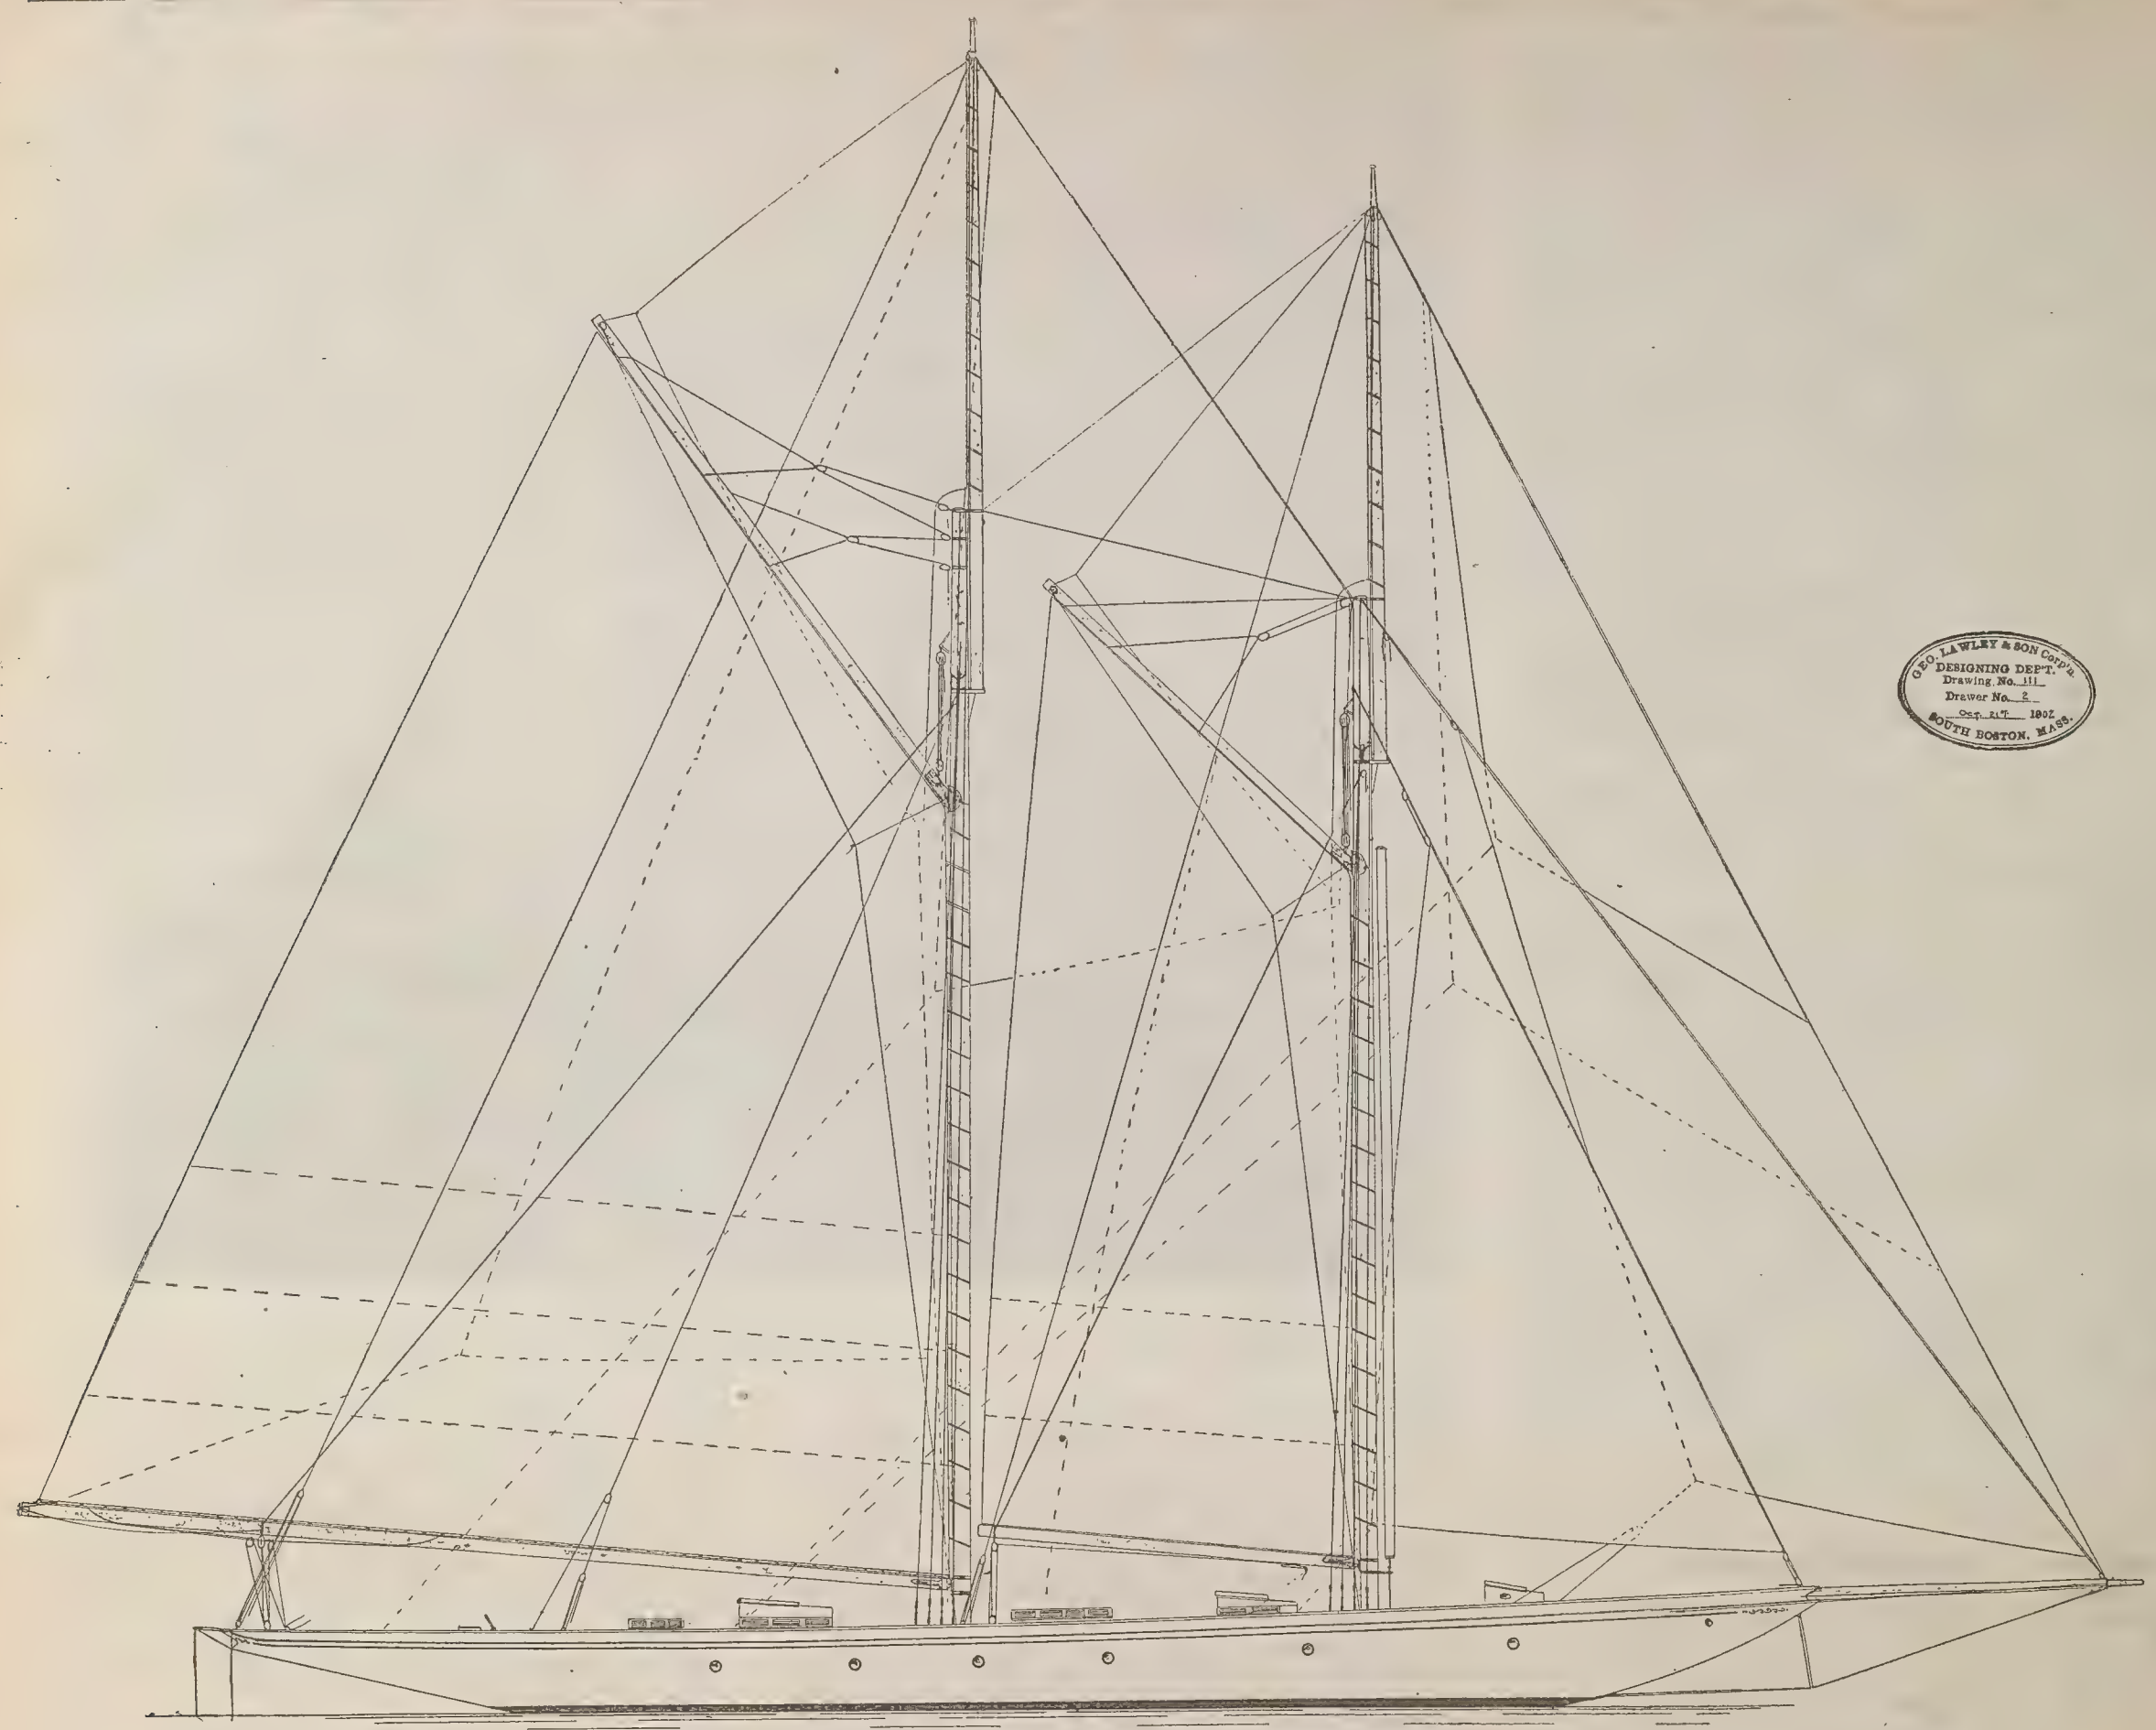
Arrived at Scotland Lightship ten minutes after three o'clock in the afternoon.

English Letter

THE most notable event in yachting since my last letter is an order given to Messrs. Fife for a 65ft. racing cutter. This is the first yacht over 52ft. as yet built under our rule. No doubt this will be followed by others—if not Tutty will prove but a poor antagonist, though she is, for her time, an admirable boat. Once the new Fife sixty-five is seen, I have no doubt she will be a strong inducement to others to build, for the rule will be at about its best in this class. The name of the owner of this new boat is as yet a sacred secret. I have long since come to the conclusion that the true value of yachting and yacht racing has hitherto been entirely overlooked. The sport is a safety valve for conspirators. The awful plots that we read of in history would never have been hatched if yacht racing had then been popular. Those countries, such as Russia, that have a poor opportunity for practicing the mystery of yachting, are hotbeds of conspiracy. There is certainly something in the idea.

The news of a definite challenge from Sir Thomas Lipton has been considerably discounted long since, and even the daily papers have not been able to make much of it. Some journals which make yachting a feature of their publication appear anxious to decry the baronet's efforts in the Cup line, but so far as British yachting is concerned, these races never do any harm to the sport at home, and, indeed, furnish a very welcome variety to the deadly monotony of our season. Of course if we had a uniform measurement and classification, the Cup races would serve to recruit the racing fleet of both countries. In connection with the next races, some doubt has been expressed as to whether the change in the New York Y. C.'s measurement rule will affect the time allowance between the competitors. I have no doubt that no such intention exists, but it seems to me that the club will have to take some steps to avoid it. The challenge and acceptance are under the same conditions as governed the last races, but one of the conditions was the application of the N. Y. Y. C. time scale—not a specified time scale, but merely that in use by the club. When the next races are sailed, the "same conditions" would involve the use of the club's time scale, but that time scale would be new. They have plenty of lawyers in the club to puzzle this out, and it ought to be settled soon. In all probability it won't make the slightest difference either way, but Cup races should be free from probabilities of this nature.

We are promised a recrudescence of the luffing rule trouble this winter, and many yachtsmen appear to wish for the



56-FOOT WATERLINE CRUISING SCHOONER—SAIL PLAN—DESIGNED BY F. D. LAWLEY AND BUILT BY THE GEO. LAWLEY & SON CORP., 1902.

adoption of the American rule. On the other hand, in Australia they have tried your rule and fallen back on ours as preferable. As a matter of fact, no rule of the sort ought to be countenanced by our Y. R. A., for a pious expression of opinion appears in its rule book that races should be a test of speed and seamanship. To hang yourself and another boat up in the wind while a third goes past you both, does not achieve this ideal state of things. But luffing has a charm all its own, and it would be a pity to give it up. It is not pleasant to the luffer or the luffee to see a third boat go past. Then why do they risk it? Simply because luffing is such good sport between themselves that for the mere sake of it they will jeopardize the chances of both. No disputes could ever arise if a boat could luff as she pleases. Often, of course, a weather boat would be fouled when nothing could prevent her from getting past. But, knowing of this risk, it would be her own fault for taking it. Both ours and the American rule are counsels of (mistaken) perfection, tending to endless disputes in which one side always will remain dissatisfied.

To-day Messrs. Stephen & Son, Clyde, are launching the new turbine steam yacht built by them for Sir Christopher Furness. The vessel is about 750 tons, and the engines are expected to develop 1,500 horse-power. All our papers unite in calling this the first turbine steam yacht in the world, forgetting that Col. McCalmont's vessel was in commission last July. Sir Christopher's new boat is to be named Emerald.

The steam yacht Maria, lately bought by Mr. F. G. Bourne (who, I understand, will soon be Commodore of the New York Y. C.), had a very bad experience after leaving the Clyde on her way to New York. She left Greenock on Oct. 12, in charge of Capt. Foxworthy, who has been the late owner's captain for several years. After passing Tory Island the yacht encountered very bad weather, which only changed for the worse during three days. At one time the yacht was hove down practically on her beam ends, and a lot of water found its way below. The decks were swept repeatedly, and the fittings much damaged. On the fourth day the water was getting into the stokehold, and there was every chance of the vessel foundering, so it was decided to up-helm and run for Queenstown, where she arrived in safety. The crew describe this as the worst gale they have ever faced, and it did an enormous amount of damage round our coast. Maria is a yacht of 815 tons, designed by Mr. G. L. Watson, and built for Mr. W. B. Stewart, on the Clyde. She is a fine vessel, and will be a valuable addition to the New York Y. C.'s fleet. E. H. HAMILTON.

Robert Palmer & Sons, Noank, Conn., are building a steam house-boat for Com. Hooker, of the Hartford Y. C.

56ft. Waterline Cruising Schooner.

THE 56ft. waterline cruising schooner, the cabin and sail plans of which boat appear in this issue, is now building at the yard of the George Lawley & Son Corporation, South Boston, Mass. The boat was designed by Mr. Fred D. Lawley. She is of wood construction, and will be used for cruising along the coast. Her dimensions are as follows:

Length—	
Over all	87ft. 0in.
L.W.L.	56ft. 0in.
Overhang—	
Forward	14ft. 0in.
Aft	17ft. 0in.
Breadth—	
Extreme	9ft. 6in.
Freeboard—	
Forward	6ft. 4in.
Taffrail	4ft. 9in.
Least	4ft. 3in.

The cabin plan clearly shows the interior arrangement. There is 6ft. 4in. headroom under the flush deck. The companionway leads to a steerage. Directly aft is the ladies' cabin, which is 7ft. 6in. long, and runs the full width of the boat. On either side is a wide berth under which are drawers. In front of the berths are transoms. On the after partition is a bureau with the usual drawers and shelves. At the forward end of each berth is a hanging closet. Overhead is a good-sized skylight. Underneath the companion steps is a set wash basin. On the port side is the door leading to the passageway, and on the starboard side is a door to the bath room, which is 6ft. long. Here is a bath tub, set basin and patent closet. The combination skylight and companionway gives ample light and ventilation. A door from the bath room leads to the owner's stateroom. This room is 7ft. 6in. long and has a double bed, underneath which are drawers. There is also a bureau and hanging closet.

On the port side opposite the bath room is a locker 2ft. 6in. wide for oilers, and a chart table with drawers 3ft. 6in. long. In front of the chart table is a transom. Forward of the chart space is a single stateroom 7ft. 6in. long. This room is fitted with a berth hanging closet, bureau and mirror and transom.

Next forward comes the main saloon, which extends the full width of the boat, and is 10ft. 6in. long. On the port side is a transom with lockers behind, and at the forward end is the buffet. The transom on the starboard side returns around the after partition, making a corner for the cabin table. On this side there is a buffet and lockers, corresponding to those on the port hand. Overhead is a large skylight. On the port side forward is the galley, 7ft. long. The galley is fitted with a large ice box, sink, dresser, lockers, etc. A door from the starboard side of the galley leads to the captain's stateroom. This room has a folding berth with transom under, bureau, desk, folding wash basin and clothes locker. Forward is the forecastle with berths for six men, a closet for the men's clothes and a water closet. There are beside the skylights and companionways, port holes in all the cabins, which insures good ventilation.

The boat has a good-sized sail plan, and should prove a smart boat. A gig and a launch will be carried on the davits.

The wor kon the boat is well advanced, and she will be finished at an early day.

New York Y. C.'s New Measurement and Racing Rules.

AT the adjourned meeting of the New York Y. C., held on Oct. 30, the new measurement and racing rules were adopted with amendments. It will be seen by comparing the rules with those published in these columns last week that some material changes have been made which greatly improve the rules. The rules as adopted follow:

Rule I., p. 210. Strike out all of Rule I. up to heading "Courses" in Sec. 7, on p. 215, and insert:

Rule I.—Measurements for Classification and Time Allowance.

"Yachts shall be rated for classification and time allowance according to the following formula:

$$\text{Rating Measurements} = \frac{L\sqrt{SA}}{5\sqrt[3]{D}}$$

Length multiplied by square root of sail area, divided by 5 times cube root of displacement.

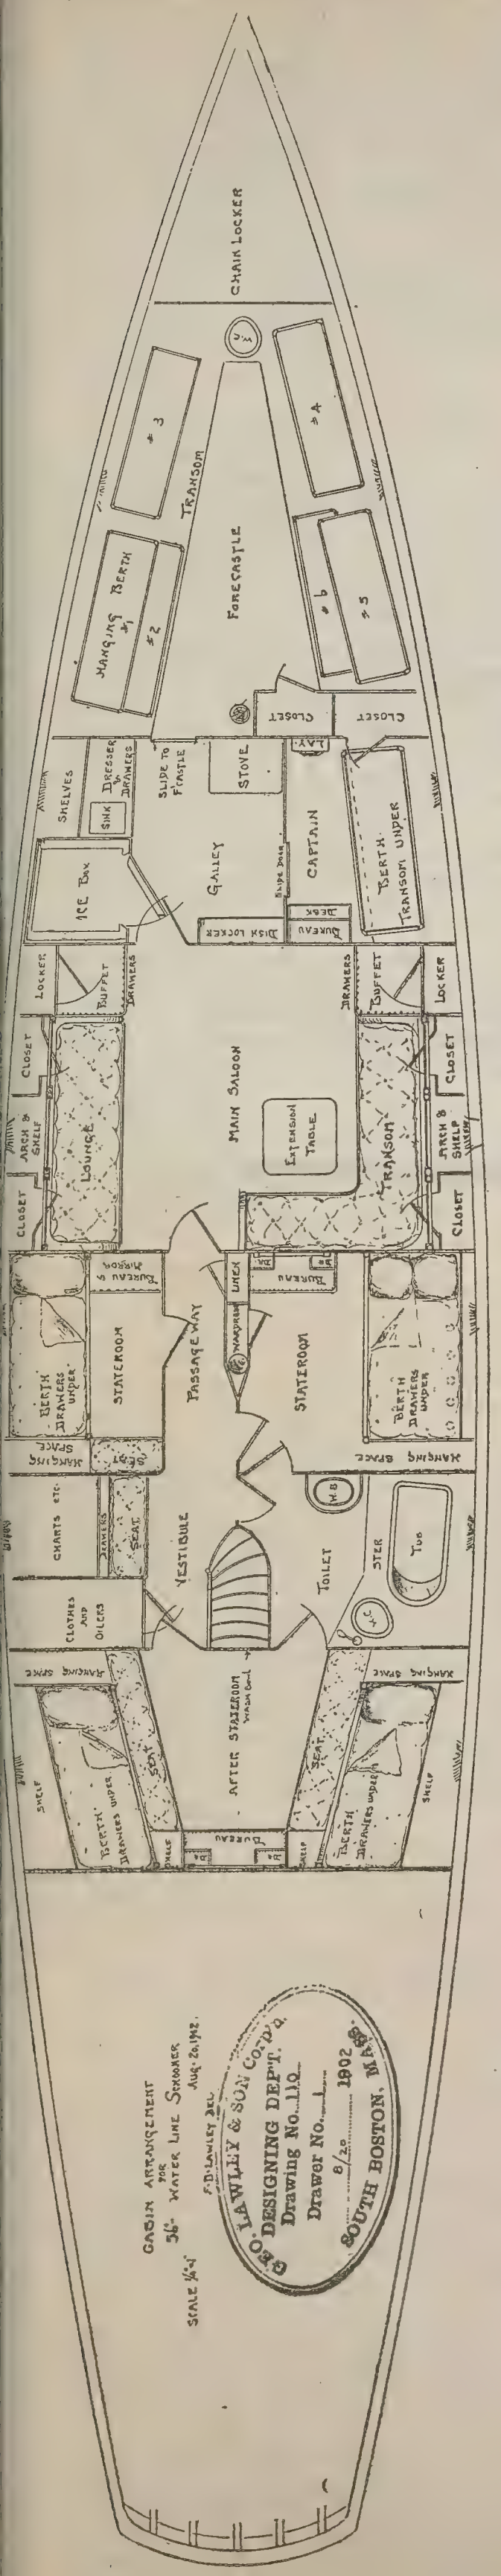
The result is the measurement for classification and time allowance.

The measurements shall be obtained as follows:

LENGTH.

The mean of the length over all, exclusive of bulwarks and rail and of the length on the load water plane, both measured parallel to the middle vertical plane and at a distance from it equal to one-quarter of the greatest beam at the load waterline.

In case the extreme width of the stern exceeds one-half the mean beam, the measurement for the length shall be taken to a point abaft the stern where the continuation of the fair line of the top edge of the plankshеer intersects the mean quarter beam line.



56-FOOT WATERLINE CRUISING SCHOONER—CABIN PLAN—DESIGNED BY F. D. LAWLEY AND BUILT BY THE GEO. LAWLEY & SON CORP., 1902.

SAIL AREA.

S. A.—Sail area to be obtained as follows, and the square root of this area to be the $\sqrt{S\ A}$ in formula:

MAINSAIL.

A. Measured from the top of the boom (under the pin for outhaul shackle on traveler, or clew slide, when hauled chock out) to the gaff under the pin of the sheave of the topsail sheet, provided the peak cringle of the mainsail does not extend beyond the pin; in the case of the yacht having no topsail, or of the peak cringle extending beyond the pin of the topsail sheet sheave, then the measurement to be taken to the peak lacing-hole.

B. Perpendicular to A, measured to underside of gaff close in to the mast.

C. Measured from top of boom over the pin of the sheave or outhaul or end of clew slide to underside of gaff close in to the mast.

D. Perpendicular to C, measured in to the mast, in a line with the top of the boom, or to tack cringle of mainsail, if below top of boom.

CLUB TOPSAIL.

E. Measured from upper side of gaff close in to the mast to pin of sheave for topsail sheet, or to lacing-hole in club.

F. Perpendicular to E, measured to lower lacing-hole in sprit.

G. From lacing-hole to lacing-hole in sprit.

H. Perpendicular to G, measured to pin of sheave for topsail sheet in gaff; or to upper lacing-hole in club.

JIB HEADER.

K. Measured from top of gaff close in to mast to pin of halyard sheave in topmast.

L. Perpendicular to K, measured to pin of topsail sheet sheave in gaff; or to upper lacing-hole in club.

LUGSAIL.

To be measured as mainsail, except as follows:

A. Upper end measured to peak lacing-hole in yard.

B. and C. Forward end measured to lower lacing-hole in yard.

D. Lower end measured to tack cringle of mainsail, if below top of boom, or forward of mast.

HEADSAILS.

I. The perpendicular I to be measured from the deck at the foreside of the mast to where the line of the luff of the foremost headsail, or of the spinnaker halyard, as the case may be, when extended, cuts such perpendicular. In the case of a schooner the perpendicular I shall be measured upon the foremast, unless she has a main spinnaker the height of which exceeds the perpendicular upon the foremast, in which case the excess shall be added to the perpendicular I.

J. The base J to be measured from the foreside of the mast to where the line of the luff of the foremost headsail when extended cuts the bowsprit, other spar, hull, etc., as the case may be. In all cases, if the distance from the center fore and aft line of the mast to the outer end of the spinnaker boom exceeds the distance from the foreside of the mast to the bowsprit end (where cut by the line of the luff of the foremost headsail), the excess shall be added to the base of the fore triangle. In the case of a schooner, the base J shall be measured from the foremast, but if the main or longest spinnaker boom exceeds the before mentioned distance, the excess shall be added to the base J.

In the case of a yacht having no headsail, but carrying a spinnaker, the area for headsail shall be computed from the length of spinnaker boom, and the height from deck to where the line of the halyard of the spinnaker when extended cuts the mast.

A spinnaker may have a headstick or board not longer than one-twentieth the length of the spinnaker boom, but not a foot yard, or more than one sheet, or any other contrivance for extending the sail to other than a triangular shape.

In the case of a yacht carrying a square sail, or square topsail, or raffee (together or separately), the actual area of the same shall be computed; and if such area exceed the area of the fore triangle, the excess shall be used in the total area for determining the rating.

FORESAIL OF SCHOONERS.

To be measured as mainsail, except that the lower end of A is to be taken at foreside of mainmast, in a line with main boom gooseneck.

Directions for Measuring Sails.

The measurer shall take measurements I and J for fore-triangle, G and E for club topsail, and the length of spinnaker boom. If the other measurements are supplied by the sailmaker, the measurer shall check them by measuring the following:

Boom, from lower end of A to lower end of D.

Gaff or lugyard, from upper end of A to forward end of B.

Club topsail, sheet to outer lacing-hole.

In cases where it is necessary for the official measurer to measure the sails, he shall do so in the following manner: Take the length of boom from mast to pin of sheave for outhaul, and length of gaff from mast to pin of topsail sheet sheave or lacing-hole, as the case may require; then hoist the sail with the tack fast and set the peak and luff up taut, and let go the topping lifts so that the weight of the boom comes on the leach of the sail. With a line and tape, measure the leach and luff and the diagonal C. For the headsail measure the height I, and the distance J, as provided for in the section dealing with headsail. For topsail the sail should be hoisted and marked in a line with the gaff; then lowered and the other dimensions taken. From the measurements so taken a sail plan should be made and the other above-specified measurements obtained therefrom.

Calculation of Sail Areas

MAINSAIL.

Multiply A by B and C by D, and add the two products together and divide by 2.

YARD TOPSAIL.

Multiply E by F and G by H, and add the two products together and divide by 2.

JIB HEADER.

Multiply K by L and divide by 2.

HEADSAILS.

Multiply I by J and divide by 2.

LUGSAILS AND HEADSAILS.

No deduction is to be made from headsail area on the score of any portion of the lugsail area ahead of the mast.

SAILS BOUNDED BY CURVED EDGES.

Any increase in the area of sails due to curved edges, extended by battens or otherwise beyond the line between the points for measurement, shall be computed as follows: Multiply the base E by two-thirds of the perpendicular P.

DISPLACEMENT.

D—Displacement to be obtained as follows:

At points dividing the length of the load waterline into five equal parts, find areas of immersed cross sections in square feet; from the areas in square feet obtained and load waterline length, find approximate displacement in cubic feet, which will be the D in formula.

LIMIT OF L.W.L.

One-half of any excess of L.W.L. over one hundred and fifteen per cent. of L shall be added to the rating measurement.

LIMIT OF DRAFT.

Limit of draft in feet = .133 (rating measurement) + 2.66.

Any excess of draft, exclusive of centerboard, as per above formula, shall be multiplied by five and added to the rating measurement.

The draft of any vessel, exclusive of centerboard, shall not exceed 18ft.

LIMIT OF SAIL AREA.

Any excess of the square root of sail area over 135 per cent. of L, shall be added to the rating measurement.

All measurements of hull shall be taken with only such persons on board as shall be required by the measurer.

The L.W.L. shall be the distance in a straight line between the points furthest forward and furthest aft, where the hull, exclusive of the rudder post, is intersected by the surface of the water when the yacht is afloat in racing trim.

All measurements specified may be certified to by the designer, in a certificate to be filed with the measurer of the club, but such certificate must be accompanied with drawings, showing the measurements taken and the true line of flotation of the vessel when measured in racing trim, which line of flotation must be verified by the measurer, before any certificate of measurement shall be accepted by the secretary.

If from any peculiarity in the build of a yacht, or other cause, the measurer shall be of opinion that the rule will not rate the yacht fairly, or that in any respect she does not comply with the requirements of these rules, he shall report the circumstances to the Regatta Committee, who, with the measurer, after due inquiry, shall award such a certificate of rating as they may consider equitable, and the measurement shall be deemed incomplete until this has been done.

Classification.

SCHOONERS.

Class A. All over 100ft., rating measurement.

Class B. Not over 100ft. and over 80ft., rating measurement.

Class C. Not over 80ft. and over 64ft., rating measurement.

Class D. Not over 64ft. and over 51ft., rating measurement.

Class E. Not over 51ft., rating measurement.

SINGLE-MASTED VESSELS AND YAWLS.

Class F. All over 100ft., rating measurement.

Class G. Not over 100ft. and over 80ft., rating measurement.

Class H. Not over 80ft. and over 64ft., rating measurement.

Class I. Not over 64ft. and over 51ft., rating measurement.

Class J. Not over 51ft. and over 40ft. rating measurement.

Course I. Rule I., p. 215.

In line two after the word "from," insert the words "a stake boat to."

Rule IV., Sec. I., p. 217.

Add at the end of this section, the words "but this rule may be suspended for proper cause shown in the discretion of the Regatta Committee."

Rule VIII. Strike out second and third paragraphs, "Schooners" and "Single-Masted Vessels and Yawls," and substitute:

Classes A and F, one man for every 250 sq. ft. of sail area, or fraction thereof.

Classes B, C, D, E, G, H, I, J and K, one man for every 300 sq. ft. of sail area or fraction thereof.

Amend time allowance table as follows:

P. 229—On line 8, change words "60 per cent." to read "80 per cent." On line 10, change formula to read $.8\left(\frac{600}{\sqrt{I}} - \frac{3600}{\sqrt{L}}\right)$.

Strike out lines 13 and 14, and substitute:

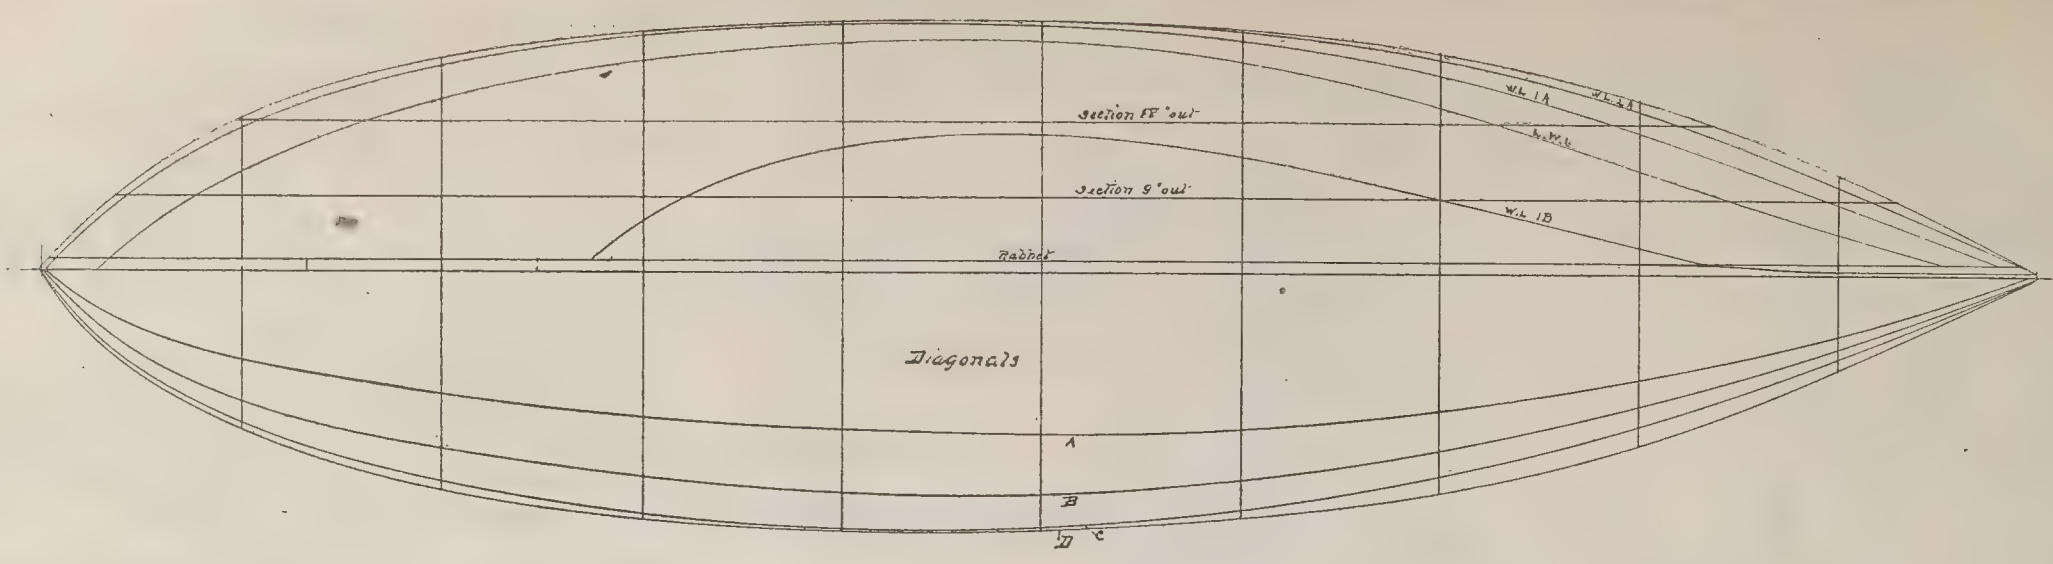
"Practically the formula is $\left(\frac{2880}{\sqrt{I}} - \frac{2880}{\sqrt{L}}\right)$; eight-tenths of 3,600 being 2,880."

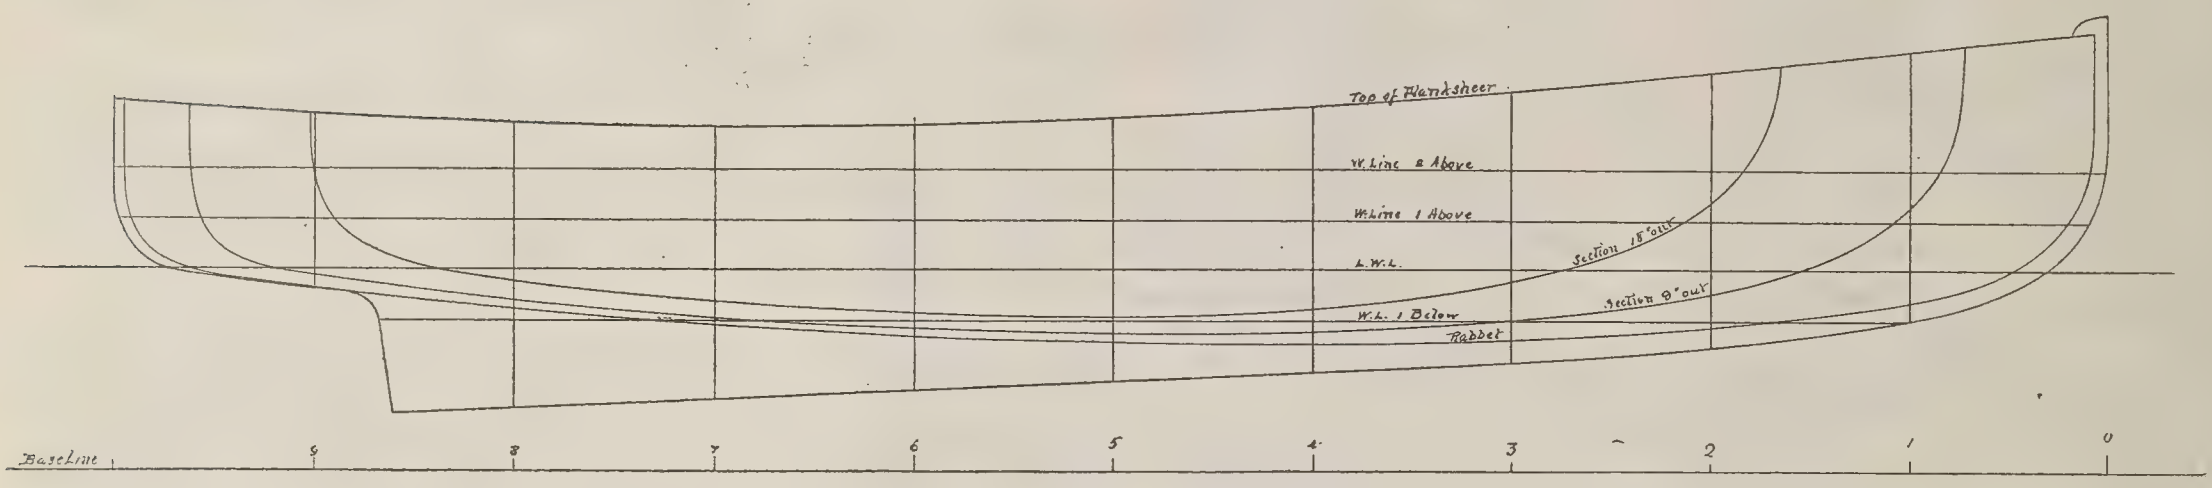
Alter example given on p. 230 to new formula.

Amend tables of "Time Allowance for One Nautical Mile in Seconds and Decimals" on p. 231, 232, 233, 234, 235, 236, 237 and 238 to new formula.

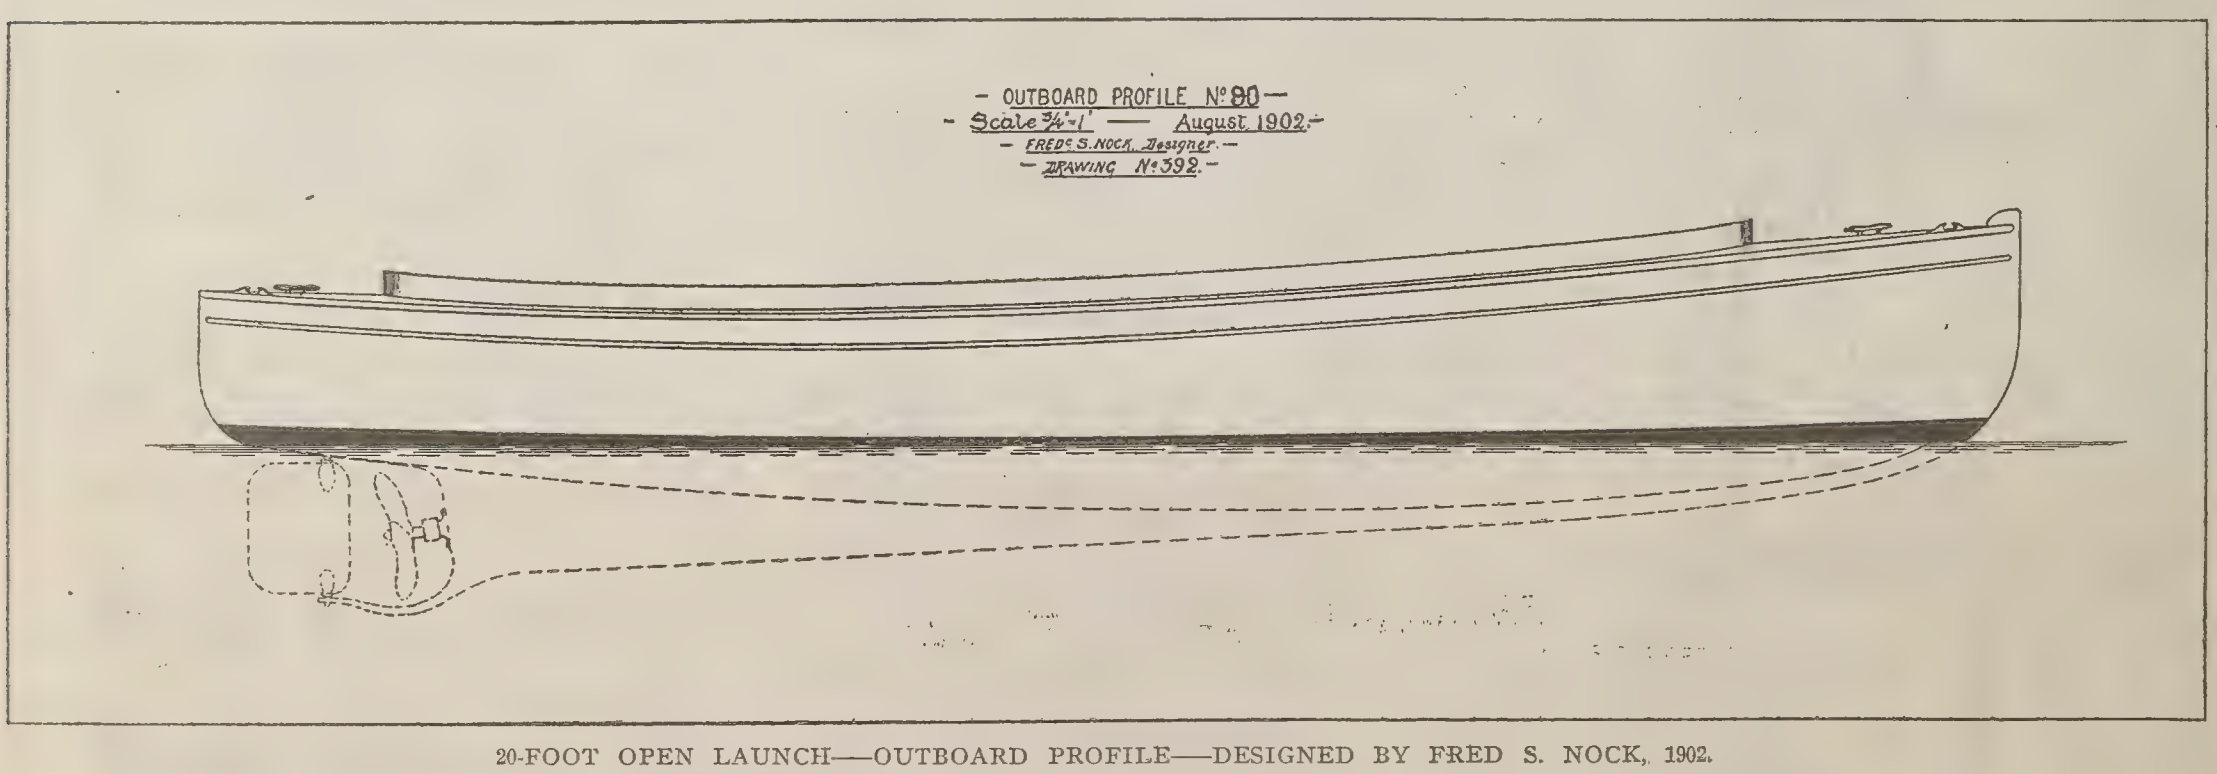
Messrs. Charles G. Davis and Walter M. Bieling have formed a co-partnership under the firm name of Davis & Bieling, and will transact a general yacht brokerage business at 50 Broadway, New York city.

Mr. Wilson Marshall, Vice-Commodore of the Larchmont Y. C., is to have built from designs made by Messrs. Gardner & Cox, an auxiliary schooner yacht 135ft. long. The Townsend & Downey Shipbuilding Co., Shooter's Island, will build the yacht.





20-FOOT OPEN LAUNCH—DESIGNED BY FRED S. NOCK, 1902.



20-FOOT OPEN LAUNCH—OUTBOARD PROFILE—DESIGNED BY FRED S. NOCK, 1902.

Boston Letter.

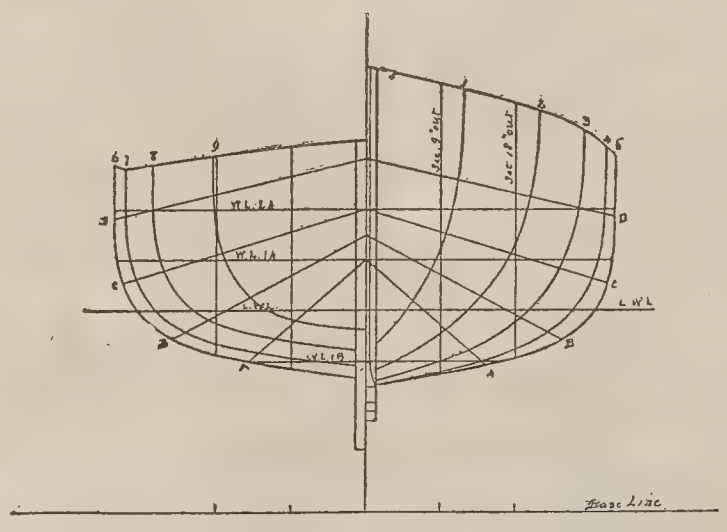
BOSTON, Nov. 2.—The adoption of new measurement rules for rating is still the subject of debate among the yachtsmen of Massachusetts. A meeting of the Yacht Racing Association of Massachusetts was held last Thursday evening, at which it was proposed to adopt a rating rule similar to that which has been recently adopted by the New York Y. C. The fact that this rule was adopted by the Eastern Y. C. at its last meeting gave it more support than it had at the special meeting of the Association, held two weeks previous; but the majority of the delegates were still in doubt about adopting any radical changes without further consideration. On this account the matter was held over and will be acted upon at another special meeting to be held Nov. 13. Mr. Louis M. Clark is the champion of the proposed new rule in the Yacht Racing Association, and, while he was not successful in having it passed at the last meeting, he did get some minor rules adopted, which will probably affect the greater question when it is again brought up.

The new 22ft. class was brought up for adoption at the last meeting of the Association, but failed in passing. The vote, however, showed that opinion is pretty well divided upon the merits of the class. It requires a two-thirds vote of the Association to change any of its rules, and the vote upon the question of adopting the 22ft. class stood six for and six against. It may be said that it is the hardest possible thing to get the necessary number of votes to make a change in the Association's rules, especially when a new class or rules which will cause the establishment of a new class are considered. The yachtsmen look with disfavor upon anything that looks like a change. This was the condition when the present restricted classes were adopted. A howl of indignation was sent up and it was some time before sufficient confidence was felt to insure the building of new boats in any numbers. The rules which were then adopted fitted the conditions which then existed, but it has been since shown, as has been the case with most measurement rules, no matter how commendable, that certain conditions have arisen which make the rules, which were then to the point, insufficient. Since the first talk of adopting some rules similar to those of the New York Y. C., opinions have changed greatly. The inconsistency of the present rules are being realized and the result has been that more yachtsmen were favorable toward the adoption of the New York rule at the last meeting of the Association than at any time previous. Whether the rules will grow in favor before the next meeting is a matter of conjecture.

But the refusal to adopt the 22ft. class and the fact that the maintenance of the old rules, or the adoption of new ones, for the restricted classes, is causing an apathy from which yachting will be slow in recovering. As it is, everything is in the air. Designers have provisional orders for new yachts, but the prospective owners are not disposed to go ahead in the present unsettled condition of affairs. The designers feel the same way about the matter. They do not feel that it would be consistent to turn out yachts only to find that they might be barred or receive new classification under new rules, which would be detrimental to their chances of winning. It is said that there are certain of the yachtsmen who have been interested in the formation of the new 22ft. class who will build for that class anyway, but it is not likely that the number would be as great in any event as it would have been had the Association adopted the class. If sufficient number of boats should be built for the 22ft. class the clubs would undoubtedly give them races.

The prospects for a brilliant season among the smaller restricted classes in Massachusetts Bay do not appear to be as bright as the majority of the yachtsmen would wish. There is a movement on foot to revive the raceabout class, and already two meetings have been held, one by the yachtsmen interested, who may possibly build for the class and another by the Knockabout Association, to consider the advisability of changing some of the rules. Some of the prospective owners of raceabouts desire that a balloon jib should be added to the equipment. If the yachtsmen will agree upon this point there is no doubt that the Knockabout Association will do everything in its power to give them what they want. The objection made to the addition of a balloon jib is that there are now sufficient sails used in proportion to the size of the crew, and that the spinnaker, as used at present, can be poled forward until it takes the place of a ballooner. To this the advocates of the ballooner claim that it would be much easier to set and take in a ballooner, with the same crew, than it is to flow the spinnaker forward; that the addition of the sail would make the boats faster, a regular balloon jib having more shape than one improvised from a spinnaker. They also claim that it would be better in producing skillful skippers as it requires considerable judgment to know just when to set a spinnaker and when to set a balloon jib. Raceabouts were very popular in Massachusetts Bay a few years, but the decline of the class was as swift as its rise. The class is popular in other sections, and it is thought that there should be no reason why it should again be popular here. It is the hope of those interested in reviving the class that interclub racing may be had with the clubs of Long Island Sound, Buzzard's Bay and Bar Harbor.

JOHN B. KILLEEN.



20-FOOT ONEN LAUNCH—BODY PLAN.
Designed by Fred S. Nock, 1902.

20ft. Open Launch.

THE plans of the 20ft. open launch that appear in this issue were designed by Mr. Fred S. Nock for a day boat. Comfort was the first consideration, as she was to be used mainly for a family boat, and speed was a secondary consideration, but with a three-horse-power motor she has shown very fair results. The dimensions follow:

Length—		
Over all	20ft.	0in.
L.W.L.	18ft.	11in.
Overhang—		
Forward	0ft.	7in.
Aft	0ft.	6in.
Breadth—		
Extreme	5ft.	0in.
L.W.L.	4ft.	8in.
Draft—		
To rabbet	0ft.	9in.
Extreme	1ft.	6in.
Freeboard—		
Forward	2ft.	5in.
Aft	1ft.	8in.
Least	1ft.	5in.

The keel is of white oak sided 3in., the frames are of oak 1in. square, spaced 8in. on centers, and the planking is of cedar ¾in. thick when finished. The cockpit is 15ft. long.

New York Y. C.

COM. LEWIS CASS LEDYARD presided over the adjourned meeting of the New York Y. C., held on Thursday evening, Oct. 30. The meeting was well attended, and after the routine business had been disposed of, Com. Ledyard announced that the contract was signed for a new yacht

to be built for the Cup defense by the Herreshoff Mfg. Co., and that work on the boat had already begun. The following gentlemen make up the syndicate that owns the new defender: Messrs. Elbert H. Gary, Clement A. Griscom, James J. Hill, William B. Leeds, Norman B. Ream, William Rockefeller, Cornelius Vanderbilt,, Henry Walters and P. A. B. Widener. Mr. C. Oliver Iselin will be the managing owner of the new boat, and Capt. Charles Barr will be the skipper. Columbia will also be put in commission, as will Constitution. Capt. "Lem" Miller will sail Columbia, and she will be managed by Mr. E. D. Morgan. Capt. Urias Rhodes will again have charge of Constitution, and Capt. Norman B. Terry will assist him.

The amendments to the measurement and racing rules that were adopted at the meeting held on Oct. 23, were also adopted. The new rules are now in force, and hold for five years.

Resolutions of thanks were offered to the Eastern Y. C. by Vice-Com. Bourne, and unanimously adopted, for the courtesies extended to the New York fleet when in Marblehead during the past summer.

Rear-Com. C. L. F. Robinson also offered a resolution of thanks to the Kaiserlicher Y. C., which was passed, for courtesies extended to members of the New York Y. C.

Captains Anson Phelps Stokes, Lloyd Phœnix and Robert E. Tod, were appointed by Com. Ledyard to serve on a committee to arrange a club cruise to the West Indies during the winter season if found advisable.

General Meeting of the Y. R. A. of Long Island Sound.

THE October general meeting of the Yacht Racing Association of Long Island Sound was held at the Arena, West Thirty-first street, New York city, on Friday, Oct. 31. A committee of naval architects was appointed by the Association about a year ago to go into the question of measurement rules. This committee, which was made up of Messrs. B. B. Crowninshield, Clinton H. Crane and William Gardner, reported that the rule adopted by the Association last year had not proven satisfactory, and more time was given them to make a fuller report. The new measurement rule adopted by the New York Y. C. was discussed and action was postponed for three weeks, when another meeting will be held.

On motion, the chair was authorized to appoint a committee to confer with the Larchmont Y. C. and the Massachusetts Y. R. A., as to the possibility of adopting a uniform rule, this committee to report at the next meeting of the Association.

Beside the delegates, there was present Messrs. Crowninshield and Gardner, as members of the committee of designers; Mr. Newbury Lawton, by invitation of the Executive Committee, for the purpose of explaining the rule as adopted by the N. Y. Y. C.; Mr. A. Bryan Alley, who informally represented the Larchmont Club, and Mr. J. F. Brophy, representing the Brooklyn Y. C.

YACHTING NEWS NOTES.

The cruising yawl which is nearing completion at Port Jefferson, is for Mr. Charles R. Smith. She is 66ft. long over all. The yacht will be used in Southern waters this winter.

At Amityville, Long Island, Frank Wicks is building for Mr. Fred B. Dalzell, of the Unqua-Corinthian Y. C., a racing catboat. She is 24ft. over all, 8ft. breadth and 20in. draft.

Countess Adeline Schimmelmann has sold her mission yacht, the Duen, or Dove, which has laid idle for some time at Manning's Basin, Brooklyn. The price was $600 and the purchaser, a Philadelphia man, is having the noted vessel rebuilt into a house-boat. The two brass saluting guns and the 20ft. gasolene launch were not sold, and they are being put in readiness to be shipped to the Countess in Denmark. The sale was made through Henry Endner, a spar maker, of Beard street. Countess Schimmelmann purchased the Duen from Prince Waldemar of Denmark in 1895. She was originally named the Tumbler and registered fifty-three tons. After becoming the property of the Countess, the yacht, in 1897, visited fifty-eight ports in Germany, Denmark, England, Sweden and Italy, distributing tracts. She also visited 652 ships on the same mission. With a crew of eight men, the Duen reached the Great Lakes and cruised there in 1898 with the owner on board. The Countess was nearly drowned while returning to shore on one occasion from a gospel meeting on the Duen.

Rifle Range and Gallery.

Rifle at Shell Mound.

SAN FRANCISCO, Cal., Oct. 27.—Yesterday was bullseye day at Shell Mound. The fight for annual cash prizes in the Germania 3-shot contest is waxing warm, F. E. Mason leading by a few points. A 72 does him no good. The count is: Best ten 3-shot scores. First prize, $60. Scores yesterday:

At the San Francisco Schuetzen Verein, monthly bullseye shoot prizes were won in the following order: W. Appiarius 193, E. Doell 283, August Pape 333, August Jungblut 453, John Utschig 522, O. Burmeister 538, August Goetze 568, Gustave Schulz 596, J. Gaefken 748, F. Brandt 768, F. P. Schuster 778, S. Heino 826, D. B. Faktor 860, F. Rust 870, J. de Wit 981, Herman Huber 1006, J. C. Waller 1041, Charles Oldag 1100, R. Stettin 1216, J. D. Heise 1243, Henry Meyer 1248, A. Lemaire 1270, August Meyer 1336, E. Stehn 1556.

Golden Gate Rifle and Pistol Club, pistol match, gold medal: J. Kullman 90.

Handicap: J. Kullman, 90, 83, 81; Dr. D. Smith, 83, 84, 83, 81.

Revolver handicap: J. R. Trego, 88, 86, 85, 84, 80; Dr. D. Smith, 80, 77, 77.

Rifle handicap match: G. Henderson, 220, 209; A. Gehret, 218; W. F. Blasse, 201.

Gold and silver bars: G. Tammeyer, 215, 213, 208, 208; W. F. Blasse, 217, 214, 214, 201; M. Blasse, 206, 212, 209.

Silver medal: G. Mitchell, 201, 188.

Glindemann trophy: W. F. Blasse, 215.

Germania Schuetzen Club, monthly bullseye shoot: F. E. Mason 272, A. Gehret 435, A. Goetze 540, John Utschig 630, August Jungblut 740, S. Heino 900, F. P. Schuster 1162.

Germania Schuetzen Club, monthly trophy contest: D. B. Faktor 221, Herman Huber 215, F. E. Mason 214, F. P. Schuster 213.

Competition shoot: A. Pape 72, F. E. Mason 71, N. Ahrens 70, F. P. Schuster 70, A. Gehret 70, A. Jungblut 68, D. B. Faktor 69.

Norddeutscher Schuetzen Club, monthly medal shoot: First champion class, F. P. Schuster, 429; second champion class, F. C. Rust, 401; first class, D. Salfield, 394; second class, John Lankenau, 369; third class, Henry Meyer, 369; fourth class, August F. Meyer, 294; best first shot, Herman Huber, 24; best last shot, F. P. Schuster, 22.

ROEEL.

Cincinnati Rifle Association.

CINCINNATI, O.—The following scores were made on Oct. 26 at 200yds., off-hand, Standard target. The members contested for trophies during the last six months, which consisted of medals for first, second and third class, and were won by the following members: Nestler, first class; Jonscher, second class, and Hofer, third class;

Hasenzahl	91	88	84	84	84	Roberts	80	79	77	76	73
Payne	89	88	83	81	81	Lux	74	73	72	70	69

Nestler	84	82	78	78	77	Weinheimer	73	70	68	64	61
Trounstine	84	82	76	73	70	Freitag	71	68	67	64	62
Odell	83	81	80	79	79	Topf	61	54	54	54	54
Jonscher	82	80	78	77	74	Drube	76	..	..	..	..
Hofer	81	77	77	76	73	Uckotter	71	..	..	..	..

Trapshooting.

Fixtures.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Fourth Tuesday of each month, Hell Gate Gun Club's shoot at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Second Friday of each month (January and July excepted), shoot of Hell Gate Annex, at Dexter Park, Brooklyn.

Saturdays, Brooklyn Gun Club's shoot, Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

Saturdays, Newark, N. J., South Side Gun Club's shoots, South Broad street, near Lehigh Valley coal depot.

Saturdays, Outwater's grounds, Carlstadt, N. J., live bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice.

DRIVERS AND TWISTERS.

The daily press recounts that "Mr. George Page, the champion wing shot of Mercer county, N. J., was defeated here to-day in a 50-bird match by Mr. William Widman, of Trenton. Widman killed 49 birds straight, while Page succeeded in grounding but 41. This is the first live-bird shoot held here since last fall, when an effort was made to secure legislation against the pastime. The match was for $50 and the championship of the county."

We publish a cut of the Florist Gun Club's club house, situated on the club's beautiful grounds at Wissinoming, Philadelphia. The club house is commodious and thoroughly equipped with every convenience for the members and their guests. The club is one of the most active in America, and the club grounds have been the scene of many contests eminent in the annals of trapshooting.

THE FLORIST GUN CLUB'S HOUSE.

Mr. John S. Wright, manager of the Brooklyn Gun Club, has been knitting his brow of late, a habit which he exercises when in profound thought. He was thinking about trapshooting matters. He announces that he will give a Christmas Day shoot at Interstate Park, Long Island, the particulars of which will be published later. He says it will be arranged on popular lines.

The contest for the championship of New Jersey, of which the E. C. cup is the emblem, terminated in favor of the holder, Mr. Neaf Apgar, of Plainfield, N. J. The challenger was Mr. George H. Piercy, of Jersey City, a gentleman of skill and renown. The scores were: Apgar 46, Piercy 39. The weather conditions were unfavorable for high scores:

Mr. W. W. Marshall scored the first win on the November cup at the shoot of the Crescent Athletic Club, at Bay Ridge, L. I., last Saturday. With handicap allowance added, he scored 47.

At the shoot of the Hell Gate Gun Club, at Outwater's grounds, Carlstadt, Oct. 28, Messrs. Peter Garms and P. Albert scored straight in the club event.

At the Hillsboro (Ill.) Gun Club's tournament, Oct. 30, Mr. F. C. Riehl won high average, and Mr. W. Montgomery second high average.

On the grounds of the Fairfax (S. D.) Gun Club, Oct. 29, Mr. J. F. Spatz, challenger, defeated Mr. Carl Porter, holder, in a contest for the Peters Cartridge Company trophy, emblematic of the target championship of Gregory county. The scores were 41 and 37.

On account of Tuesday, No. 4, being Election Day, FOREST AND STREAM went to press on Monday of this week. In consequence several communications were necessarily left over.

BERNARD WATERS.

A Theory Concerning Obstruction.

I NOTICE that you have lately reopened the vexed question as to the causes of bulging or bursting guns. Many sportsmen, as you pointed out, believe that the air, imprisoned between the moving shot and the obstruction near the muzzle, does the damage, while others are of opinion that the bulging effect is due to the wave action of the powder gases behind the moving shot. A single experiment will convince you and your readers that neither the imprisoned air nor the wave action is an essential agent in this respect.

Take a 12-bore shotgun barrel and close it at the muzzle by an ordinary shot charge between two wads; behind this obstruction let the walls of the gun be pierced by three circular holes of 7 millimeters (.276in.) diameter each, two of them close behind the wadding and diametrically opposite to each other, the third hole being midway between, and lying a little more toward the breech. These three holes serve to allow the compressed air to escape. About 12 centimeters (4.7in.) further toward the breech make seven similar holes in the walls of the barrel, the whole area of these seven holes being about equal to that of the muzzle of the gun, so that nearly the same amount of gas may pass through these seven holes as ordinarily passes through the muzzle.

Your readers will doubtless remember that in your number 2295 of Dec. 19, 1896, page 997, an experiment was described relating to a 12-bore shotgun. In the cartridge case the shot was replaced by an accurately fitting piece of very hard wood about 6in. long, each end of which was provided with a felt wad. If the above-mentioned perforated gun be loaded with a cartridge containing 5 or 6 grammes (77 to 93 grains) of black powder and the peculiar wooden projectile, it is obvious that in firing the gun the air between the projectile and the obstruction at the muzzle will be pressed out through the holes, and that the powder gases will begin to rush out through the rear set of holes as soon as the base of the projectile passes them. At the moment when the front part of the wooden projectile reaches the obstruction at the muzzle the air is driven out of the barrel, and a great part of the powder gases has also rushed out. Of course, the wooden projectile, after having passed the rear holes, does not receive any further acceleration, but the momentum it had attained is great enough to push it with such an amount of violence against the obstruction at the muzzle that the gun bursts at a point somewhat nearer to the muzzle than the backward wadding of the obstruction.

I think that a single shot may be sufficient clearly to demonstrate that neither the air nor the powder gases behind can produce this effect; but I may add that we here tried many experiments under varied conditions, always with the same effect—i. e., that in the case of the muzzle being obstructed by an ordinary shot charge between two wads, the muzzle end of the barrel was blown away in a length somewhat shorter than the ordinary length of the obstruction (sic). Instead of the piece of wood, we also tried other projectiles, such as cylindrical pieces of iron, etc., gradgradually diminishing their weight. We found at last that four ordinary wads tightly compressed over the powder in the cartridge case, without any other projectile, had force enough to burst the barrel in the expected manner, although the barrel was provided with the above-mentioned holes in the side walls. In all cases, the bursting of the barrel did not take place in the line of the circular holes close behind the obstruction, but a little more toward the muzzle, the holes themselves remaining uninjured. These experiments tend to prove that the bulging or bursting in the case of an obstruction at the muzzle consisting of a shot charge is due to the violent compression of this shot charge by the impact of the projectile pushing against it. The rear part of the obstructing shot charge is suddenly driven against the front part, which latter still remains in rest. Before the front part has gained time to be set in motion, the rear end of the obstruction, compressed between the front part and the projectile, is so tightly pressed against the walls of the gun that these give way, and must bulge or burst, as the case may be.

To afford further proof that the wave action of the powder gases has nothing to do with the bulging effect, we fastened in the muzzle a plug of soft iron of about 4 centimeters (1.6in.) long, and of a diameter rather less than the bore of the gun, by means of a steel nail going straight across through the walls of the barrel and through the iron plug. The walls of the barrel behind the iron plug were not perforated as in the former experiments. The cartridge was loaded, in addition to the usual powder charge, with only two tight-fitting wads, without any other projectile. On firing the gun no loud report was heard, and the powder gases slowly escaped through the small space between the iron plug and the walls of the barrel. On examining the barrel we found that the steel nail successfully withstood the strain, the holes in the barrel being but slightly enlarged. A very slight bulge was to be seen, not behind the iron plug, as must have been the case if the wave action of the powder gases had produced the bulging, but on the rear part of the iron plug itself. Here a portion of the felt wads had been strongly compressed by the powder gases between the iron plug and the walls, and under this compression of the felt the walls had given way.

In repeating the same trial, but altering the conditions by loading the cartridge with a similar soft iron plug of a length of 4 centimeters (1.6in.), the muzzle of the barrel was blown away; the bursting, however, did not take place behind the movable plug, but rather at a fore end of it, and the remaining parts of the barrel showed the greatest amount of bulging at the point where the movable plug had touched the rear end of the fastened plug. Here the two ends of the plugs, and especially the fore end of the movable plug, clearly showed the beginning of what is known to all sportsmen as mushrooming of lead bullets when shot into sand, etc. By this action the diameter of the two plugs at their ends was so enlarged that bulging of the barrel must have been the result. No bulging was to be seen behind the movable plug.

It cannot be surprising that in all cases when we projected a common shot charge against the fastened iron plug, the bursting occurred not behind the shot charge, but rather in the middle of it, where the greatest compression of the pellets took place. The bulging or bursting effect may occur if any slight obstruction in the barrel suddenly checks the traveling shot. In this very usual case the rear part of the traveling shot is driven forward by the powder gases, while the front part is suddenly slackened in its motion. The pellets of the shot, therefore, are tightly compressed together, the diameter of the shot charge becomes greatly expanded, and the walls of the gun give way before the increasing strain.—Major Thiel (Manager of the Deutsche Versuchs-Anstalt für Handfeuerwaffen), in Field (London).

WESTERN TRAPS.

Chicago Gun Club.

Chicago, Ill., Oct. 27.—The final shoot of the Chicago Gun Club was held on its grounds, Saturday, Oct. 25, and concluded one of the most successful of the many seasons of the club's existence. The past season the club adopted a handicapping system that has proved the most equitable of any heretofore used, giving all shooters an even chance for the prizes.

In matters of prizes the club's policy has been liberal, giving three monthly merchandise trophies and added money each week in a sweepstake. The monthly prizes of $2 each, three each month, were won as follows:

W D Stannard	5	$10 00	A Walters	2	$4 00
A W Morton	4	8 00	F P Stannard	2	4 00
J P Bowles	3	6 00	Dr Carson	1	2 00
Cap	2	4 00	Parker	1	2 00
Dr Morton	2	4 00	G V Weart	1	2 00

The $60 added money, or $2 each week, was given as added money for club sweep, and ties divided. Three each month were won. Lem Willard won special prize (a Harrington & Richardson hammerless revolver) for June, score being highest for month without handicap.

The five best averages out of a possible 250 were:

	Score.	P'r C't.		Score.	P'r C't.
W D Stannard	246	98.4	F P Stannard	222	88.8
L Willard	232	92.8	J P Knowles	220	88
Cap	226	90.4			

The winners of the annual prizes were as follows: W. D. Stannard won first prize, a $95 grade hammerless ejector shotgun, donated by the Lefever Arms Co., of Syracuse, N. Y. This prize was won on seven out of thirty weekly contests. The second prize, an iron duck boat, which was donated to the club by Mr. W. H. Mullins, of Salem, O., was won by Mr. A. W. Morton, on five wins. Third prize, highest average, without handicap, on ten high scores, was won by L. C. Willard, who received $20. Fourth prize of $20, was won by Dr. W. E. Burcky. Fifth prize of $20 was won by J. P. Bowles. Sixth prize of $20 was won by Dr. E. C. Morton. Seventh prize, a high grade shooting coat, donated to the club by Mr. H. J. Updegrove, of Valpraiso, Ind., was won by Cap.

In the final shoot Walters, F. P. Stannard, Cap, Dr. Mortno and Weart made straight scores, which, after a spirited shoot-off, was won by Weart.

G. V. WEART, Sec'y.

Garfield Gun Club.

Chicago, Ill., Nov. 1.—The appended scores were made on our grounds to-day on the occasion of the fifth trophy shoot of the fourth series. Hellman won Class A trophy on 21. Fred Wolff won Class B on 19. C. J. Wolff won Class C on 16..

The trophy shoot was followed by the cup shoot, which was tied for by Hellman and Pollard on scores of 21. After tieing again in the next event, and both being out of shells, they tossed a coin for it, and Hellman won on the toss.

The day was a bad one for target shooting, as a strong head wind made the flights extremely erratic, and a shooter had to keep nerved right up to get them.

Twenty-sixth trophy shoot, 25 targets:

F Wolff	1101111110011111110101110—19
Dr Meek	1111110110110111111100110—19

JOHN WATSON.

IN NEW JERSEY.

Hell Gate Gun Club.

Carlstadt, N. J., Oct. 28.—There were twenty-three members and two guests at the Hell Gate Gun Club's shoot to-day. The birds were fair. The weather was pleasant and favorable for good shooting. Two scored the limit of 10 in the club event, namely, Messrs. P. Garms and P. Albert. A number missed but one bird. The scores, etc., follow:

Dr Roof, 30	2222*22222	9	
V'n Valkenb'g, 28	2212020212	8

Championship of Gregory Co., S. D.

BONESTEEL, S. D., Oct. 29.—To-day at 2 o'clock P. M., Mr. J. F. Spatz, of the Bonesteel Gun Club defeated Mr. Carl Porter, of the Fairfax Gun Club, on the latter grounds. Mr. Carl Porter, holder of the Peters Cartridge Company trophy, emblematic of the inanimate target championship of Gregory county, won by the score of 41 to 37.

The trophy was donated by the Peters Cartridge Company to the Bonesteel Gun Club, and was put up in open competition on their grounds in August, at which time it was won by Mr. Porter, and he successfully defended it against Thompson, of the Fairfax Gun Club, and again against to-day's winner, on both occasions putting up scores of 46. To-day, however, he seemed very much out of form, and Spatz proved an easy winner.

A hard wind, blowing from left to right across the grounds, made high scores impossible, and the shooting, under the circumstances, may be classed as good.

Within the next ten days a return match will be shot on the grounds of the Bonesteel Gun Club for the trophy, and a good substantial side bet between the principals in to-day's contest.

Great interest is being manifested in these contests, and there is always a good attendance.

Several sweeps were run off as usual in connection with the main event. Following are the scores of the trophy contest in detail:

Spatz	1111011111111101111111111—23
	0111111001110101111101101—18—41
Porter	0001111110110111105010111—16
	1111111100110110111111111—21—37

W. A. LEACH, Sec'y Bonesteel Gun Club.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Nov. 1.—There was an unusually light attendance at the weekly shoot of the Crescent Athletic Club to-day. The first contest for the November cup had five contestants, of whom Mr. W. W. Marshall scored 47, and was high with the aid of his handicap allowance. The scores:

November Cup, 50 targets, handicap allowances added:

	Al'ce.	Brk.	Tot'l.	Al'ce.	Brk.	Tot'l.	Total.
W W Marshall	6	18	24	6	17	23	47

Brooklyn Gun Club.

Brooklyn, L. I., Nov. 1.—The weather was cool and pleasant, favorable for comfort and good shooting. John S. Wright was on deck catering to the entertainment of his patrons. His motorman had periods of ecstatic activity and philosophical calmness, with the result that sometimes the targets flew high, wide and fast, or slow and near. The fast targets resulted in many goose eggs The scores:

Events:	1	2	3	4	5	6	7	8

Waters	5	..	7	11	15	23	15	18

No. 3 was at 5 pairs. No. 8 was at 20 singles and 5 pairs.

Oakland Gun Club Shoot.

OAKLAND, Ill.—Possibly your readers do not know much about the town of Oakland, and its good shooters. It is situated in the greatest corn country on earth, in the southeastern part of the State of Illinois. It would appear that the gun club has been keeping their "light hid under a bushel," as it has been shooting and beating the surrounding towns as a team. That the home people have strong faith in it, there can be no doubt, since on Oct. 30 and 31 there was held at this city a tournament to which the citizens donated $80 as added money.

It will be noted that the attendance was small, and there must be some reason for it. One was very possibly the short time taken for advertising and distribution of programmes, as there was no notice given through the sporting press, though the management engaged a lady shooter to be present as an attraction, and also advertised two professionals who failed to appear.

The manager of this club desires it known that there is a team of five or six men here who feel confident of defeating any like team of members of one club residing in Illinois.

The center of attraction for the last day, outside of Miss King's good scores, was that of Master Carlysle Pemberton, son of Senator Pemberton, being only fourteen years of age, shooting in the regular events, putting up his money and winning or losing like a man.

Those present hailed from nearby towns as follows: C. R. Smart, Charleston, Ill.; Miss Netta Smith, St. Louis, Mo.; S. Jones, Oakland, Ill.; S. B. Wright, Paris, Ill.; R. B. Williams, Charleston, Ill.; Elmer Van Gundy, Mason City, Ill.; Tom Williams, Decatur, Ill.; J. W. Cryden, Paris, Ill.; G. G. Rupert, Decatur, Ill..

Most all present on the first day stayed over for second day, expecting a large crowd. The weather was very good, though a bit windy, which caused some of the good ones to "go 'way back and sit down," because the shells for sale on the ground were of the kind used generally for snipe shooting. The scores:

First Day, Oct 30

O. KAW.

Hillsborough Tournament.

Oct. 30.—The gun club at Hillsboro, Ill., gave a pleasant amateur shoot in that thrifty town to-day. Nineteen guns participated, the event being conducted under expert trap rules. Targets were thrown against a dark background, which made the shooting difficult. F. C Riehl won first and Billy Montgomery second general averages. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

HAWKEYE.

Dalton Tournament.

DALTON, O.—The two days' shoot of the Dalton Gun Club, held on Oct. 30 and 31, had ten regular events each day, beside which several extras were shot. Entrance was based on ten cents per target. The purses were divided 40, 30, 20 and 10 per cent. Manufacturers' agents were barred from purses. There were two high and two low averages, for which one-half a cent was set aside from two-cent targets. The scores:

First Day, Oct. 30.

E Ball	8	9	9	..	..	G Edgers	6	..	..	..	..
W Clarke	9	7	9	7	9						

C. G. B.

PUBLISHERS' DEPARTMENT.

The E. C. & Schultze Gunpowder Company, 318 Broadway, New York, claim the following successes: Fred Coleman, of Hegins, Pa., Oct. 27, at Holmesburg Junction, Pa., defeated Harry Coldron, of Reading, 100 live pigeons per man, from the 30yd. mark, by a score of 99, the lost bird being dead out. Coldron scored 96. He used 3½drs. of New Schultze. At Spirit Lake, Ia., Oct. 21 and 22, W. R. Crosby won first high average at targets, shooting from the 22yd. mark. Second average and high average in the amateur class was won by Guy Burnside, of Knoxville, Ill. Mr. Crosby also won the special trophy in the 50-target race, scoring 46 out of 50, from 22yds. Messrs. Crosby and Burnside use E. C. powder.

Deer Shooting.

THE prospects for deer shooting in Northern Wisconsin and the upper peninsula of Michigan the coming season are exceptionally good, and fine sport is assured. Reduced rates will be made for excursion tickets from Chicago and Milwaukee to points on and via the Chicago, Milwaukee & St. Paul Railway. A synopsis of the game laws now in effect may be obtained on application to F. A. Miller, General Passenger Agent, Chicago.

Messrs. M. A. Smith & Son, of Philadelphia, Pa., must be nearly or quite the pioneer makers of sportsmen's footgear in this country. They tell us that the hunting boots and shoes which they make for women and for men are the product of fifty years' shoemaking skill, and of practical suggestions of hundreds of sportsmen. There is no part of the sportsman's equipment more important to his comfort than what he wears on his feet, and a shoe that is comfortable and serviceable is a tremendous contribution to the pleasure of an outing.

Shipley's "Gem Drag" is a new device, which, it would seem, must meet a want of all anglers who use the multiplying reel. We are told that it can be applied to any reel, and that it does not at all interfere with the action. To apply it, it is necessary merely to hold the handle of the reel, and if the fish overcomes the drag, the spool turns, but the handle does not move. The drag is made in two sizes, and will be for sale at all tackle dealers.

In these days people everywhere wish to be comfortable, and all people do more or less reading. For this reason, the reclining and easy chairs and the book cases and reading desks devised by the George F. Sargent Co., New York, have attained a wide popularity, and are found in homes all over the land. That book cases made by this concern have been adopted for the new Library of Congress is, of course, a very high indorsement of their merit.

In a brief advertisement like that of the Rippley Hardware Co., it is impossible for them to describe all the products of their factory. Beside their skiffs, hunting and pleasure boats, they manufacture various articles useful for country dwellers. What these are can be learned only by sending for their circular to Grafton, Ill.

Among the very many brands of Scotch whisky now on the market, the "Glen Garry" and "Navy Liqueur," sold by C. H. Arnold & Co., of 27 South William street, New York, take a high place. These are imported from Glasgow, and a booklet descriptive of these whiskies, and of Arnold & Co.'s wines, will be sent on request.

Mr. Neaf Apgar, of Plainfield, N. J., holder of the E. C. cup emblematic of the target championship of New Jersey, defended it on Oct. 28 at North Branch, N. J. His competitor was George H. Piercy, of Jersey City, N. J. Apgar was again victorious, winning on a score of 46 out of a possible 50, to his opponent's 39. Apgar used Peters Ideal factory loaded shells in this match.

At the trapshooting tournament connected with the forty-second State Fair of North Carolina, at Raleigh, last week, E. H. Storr, of Baltimore, Md., won high average. He used Peters factory loaded Ideal shells.

Experts on Guns & Shooting.

By G. T. TEASDALE-BUCKELL. Cloth, 390 pages. Illustrated. Price, $4.00.

The work gives the practical experience and personal views founded on practice of the leading gun makers of England. The subjects discussed are: The Evolution of Shooting During the Century; Shooting Schools; The Formation of Guns; Two Eyes in Shooting; Sights and Ribs to Guns; Style; The Shape of the Stock and Handiness; Cast-off and Bend; The Use and Abuse of the Try-Gun; Choke-bores or Cylinders; Pigeon Shooting; Game Shooting; Heat of Gun Barrels and the Effects Upon Them of Various Powders; Cap-Testing; Shotgun Patterns; Hidden Dangers in the Shooting Fields; Loading of Cartridges with Various Powders. The experts whose views are given are: Past-Masters Joe Manton and Joseph Lang; Atkin; Beesley, Boss & Co.; Churchill, Cogswell & Harrison, Gibbs, Grant, Greener, Holland & Holland, Jones, Lancaster, James Purdy & Sons, Rigby, Watts, Webley, Richards.

FOREST AND STREAM PUBLISHING COMPANY, NEW YORK

For Anglers and Big Game Hunters.

A Big Game and Fish Map of New Brunswick.

We have just had prepared by the official draftsman of New Brunswick a map of that province, giving the localities where big game—moose and caribou—are most abundant, and also the streams in which salmon are found and the rivers and lakes which abound in trout.

The resources of New Brunswick in the way of game and fish are only just beginning to be appreciated, and we are glad to offer to FOREST AND STREAM readers the first authentic information as to localities where sports may be had. The map is printed in colors, on a tough paper, and is enclosed in a stout manila envelope for protection in carrying. Price $1.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

Every sportsman should have a copy of our new 120-page gun catalogue. It's free at our store or mailed for 10 cents.

FIRST COST

vs.

OPERATING EXPENSES AND PROFIT

As Applied to the Modern Shot Gun.

You will hear it said that GREENER GUNS are high priced, and so they are—comparatively.

A trolley line is also expensive, and the cost to build an elevated railway is enormous, but if it is well done and the best material used they last indefinitely and begin to show a profit almost at once, even at so low a fare as five cents per passenger.

The same argument can be urged to the purchaser of a Greener gun. The first cost is considerable—necessarily so—for the labor is skilled, the material the best and the brains and experience of the maker all count for something.

Ordinary guns, and guns turned out by machinery, only last a season or two and are then discarded and begin a fitful downward career until they are finally lost in oblivion.

A Greener Gun, on the contrary, does not fairly begin life until it is several years old, and the few thousand shots that will rack the cheap gun to pieces simply smooths out the Greener and acts on it like oil on a fine bearing, and emphasizes those niceties of fitting that were part of the original cost, and which makes a gun really worth having.

Dr. Carver shot a Greener gun over a million times, and we have the gun here now—would not take $1000 for it—and it is in good condition yet after all these years.

If you want a gun that will shoot the strongest and the longest, pay a little more and buy a Greener. Eight gauge to twenty-eight gauge in stock. $100 to $600.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

SQUIRREL-SKIN CLOAKS.

ONE of the yellowest of the yellow journals has worked itself up to a high state of excitement over the discovery of a certain squirrel skin cloak intended for the adornment of the person of a society woman in New York. The instigating garment is composed of bits of skin from the heads of 5,000 squirrels killed in Norway; and the newspaper writer thinks it intolerable that so many innocent creatures should have been slain for the gratification of feminine vanity. When the possessor of the robe puts it on, he piously suggests, it should give her the horrors and burn her flesh. If other women are intent upon indulging in like garments, he entreats of them first to repair to Central Park and watch the squirrels there, and by contemplation of their playful and confiding ways to learn the great lesson that squirrels were created to live their lives unmolested and unsought for the gratification of woman's whims.

If the women who can afford to wear such costly garments have common sense in proportion to their purses, they are unlikely to experience pangs of remorse over their extensive collections of squirrels' skins. They will reflect that the only considerations involved are those of economy with respect to the source of supply. The one important question is whether the animals will hold out to furnish the garments; and if it shall prove that the stock is limited, so that there may be few cloaks, so human is woman that she will take increased satisfaction in the possession of a garment which cannot be common.

To speak of squirrels in the wilds of Norway or anywhere else as innocent creatures which have a right to live is to talk at random. The Central Park squirrels are accorded a right to live only so far as their existence is agreeable to the people of the city. Left to themselves, they would so multiply as speedily to become a nuisance. At intervals the park employees turn out with shotguns and kill off the surplus. The squirrel trappers in Norway and elsewhere are doing the same thing. Inherently there is no more of reason in the contention that a Norway squirrel is innocent and has a right to live than that the Norway pine in which the squirrel frisks is innocent and entitled to enjoy existence. Each is a living organism, a part of nature. Mankind holds toward the pine and the squirrel precisely the same attitude, regarding them as of utility to the human race and to be used for its benefit. This is the rule which has been followed for ages with animals and with trees, and will be followed for ages to come. Man is a carnivorous creature; he eats flesh; to supply himself with food to keep himself alive he slays and eats those wild creatures which are good for food. He propagates by millions and tens of millions other creatures which he has reduced to domesticity. Chickens, ducks, geese, pheasants, pigeons, cattle, sheep, hogs and dogs he breeds to kill and eat, generation after generation of them, through cycles of time. Other forms of wild animal life man utilizes to keep him warm; capturing them and taking their clothing for his own clothing. There have been and are sentimentalists and cranks who eschew flesh, but there are none who are permitted in civilized society to go without clothes; and there is not in principle the slightest distinction whether the material for the clothing of the human race is derived from slain domestic creatures, or from slain wild animals. To prate of the cruelty of killing squirrels for cloaks, or 'coons for caps, or seals for coats, is not only mawkish sentimentality, but it is quarreling with the whole scheme of creation so far as that scheme includes man and other animals and their relations to each other. As Dr. Watts sings:

> How proud we are, and fond to show
> Our clothes and call them rich and new;
> When the poor sheep and silkworm wore
> That very clothing long before.

To declare that animals have a right to live is a pleasing abstraction, but the proposition is one which is not accepted in practice. The right of an animal to live is never recognized when the abrogation of that right may be of any advantage to mankind. The human race farms the animal products of the earth precisely as it does the vegetable products, using whatever is of good for subsistence, for clothing or for ornament.

No healthy-minded wearer of a squirrel skin cloak feels remorse over the death of the squirrel which contributed to the making of her robe, no more than she does for the bird—wild or domestic—that gave the plumes for her bonnet, the tortoise that contributed the comb in her hair, the mollusks that yielded the pearls for her brooch, the silkworm larvæ that perished to give the silk for her dress, the kids that supplied her gloves and boots.

AWAY FROM THE BUSTLE.

THE village looked just as it had looked twenty years ago, with the elms gracefully arching the main street, and the comfortable houses set amid their gardens and orchards. There was the same pleasing picture of the apple and pear trees bending down with their loads of fruit, the barns with bulging mows, and the herds of cattle on the hill slopes. It was good for the eyes, the seeing again this quiet, peaceful, contented place, away from the unrest and drive of the surroundings the man was used to; and it was all the more grateful to him because everything was just as it had been twenty years before.

"The place has not changed a bit," he said, reflectively and musingly, aloud.

"No; and do you know why?" said the driver. "It's the Quakes"—meaning the Quakers. "They just sit and rock on their rag carpets, and think they are comfortable, They don't know no better."

The man was not in a mood for argument, and so contented himself with unspoken dissent. But the double negative, he said to himself, just expressed it—"they don't know no better." And pray why should they know better? Why should they wish to know anything better, or anything different, for themselves or for the old village? They have houses and gardens and orchards, and pastures and meadows and grain fields. They have enough, and what is better, sense to know that they have enough.

A MOMENTOUS FISHING TRIP.

IN the spring of 1899 two anglers went on a fishing excursion in the Sapphire country of North Carolina. The fishermen were Dr. C. P. Ambler, of Asheville, N. C., and Judge William R. Day, of Cleveland, O. So impressed was Judge Day with the beauty of the scenery, the grandeur of the forests, the mountain ranges and the lakes of exquisite loveliness, that he readily fell in with Dr. Ambler's suggestion that the Government should step in to secure control of the region and preserve it for all time in a condition of nature.

From that fishing excursion dates the movement to establish the Appalachian Park. Others were interested in the scheme. An association was organized to press it before the public and upon Congress. Dr. Ambler, as the secretary of the association, did heroic service in informing the public, answering objections, enlisting sympathy and support, and making the demand for the forest preserve national in scope and powerful in intensity.

The outlook is bright for a favorable action of Congress in the forthcoming session. The Appalachian Park promises to be an assured fact. When the full history of the movement which led to its establishment shall be written, the first chapter must be begun with that chance Sapphire angling trip which proved to be so momentous.

THE PLANK IN MASSACHUSETTS.

THIS year is the last one of the term of three years during which the sale of woodcock and ruffed grouse (partridge) is forbidden by the Massachusetts law. The period has been ample to demonstrate completely the excellent working of the system. Those skeptics who professed to question its utility in the beginning, were, if honest, long since convinced that the absolute stopping of the sale means a decreased killing, a replenished supply. We have not the slightest doubt that a poll of the sportsmen of the Commonwealth would show public sentiment unanimously in support of the system.

As for the game dealers, by whose co-operation or acquiescence the statute was adopted, it may fairly be assumed that in the three years which have elapsed they have found that their business could be adapted to the new conditions, and that they were not dependent upon making merchandise of these two native game birds. It is to be assumed that having adjusted their trade to the changed conditions they will be quite as ready now as they were three years ago to join in the protection of woodcock and partridge, and will make no opposition to a renewal of the anti-sale system for another term of years, or to the adoption of the plank in perpetuity.

For the sake of the country at large, so far as it may be affected by the example of Massachusetts, a readoption of the anti-sale law is extremely desirable. The Massachusetts Association and the allied organizations which are working in sympathy with it, and Commissioner Collins and his associates, are all alive to the demands of the situation, and may be depended upon to work for the extension of the present law.

There was recently found in West Virginia, near Steubenville, O., the skull of a musk-ox which came from the glacial terrace found in that neighborhood. Since its discovery, the nearly complete shoulder blade of a mammoth has been found close to where the skull was discovered. Of this skull only the back part with the horn core remains. The specimen has been broken and polished, as if the bone had been carried some distance before it was finally imbedded in the terrace from which it was recently unearthed. Dr. J. B. Hatcher, of the Carnegie Museum, who has examined it, says that it belongs to *Ovibos cavifrons* Leidy. He adds that "the chief interest attached to the present specimen comes from the additional evidence it affords as to the faunal changes brought about over this region during the glacial period."

Specimens belonging to this animal have been found at Fort Gibson, in Indian Teritory; St. Louis, New Madrid and Benton county, in Missouri; Humboldt county, Ohio; Big Bone Lick, Kentucky, and from localities in Pennsylvania, Iowa and West Virginia. These remains have always been found in glacial deposits, or in deposits that have some relation with some stage of the glacial period. It appears, therefore, that since the musk-ox presumably always preferred a climate such as they now inhabit, they moved southward before the advancing ice until they reached Indian Territory, Missouri and Kentucky, always keeping just ahead of the ice. It may be presumed that when the ice sheet retreated again they closely followed it northward.

The case of the People of the State of New York vs. the Arctic Freezing Company, of this city, which is the celebrated cold storage of game case, is making its way through the courts. As has been recorded in these columns, the case was carried to the Court of Appeals. There it is No. 340 on the calendar made up for the term, which began on Monday of this week. Despite the long time which has been consumed, the progress made with the cold storage case has not been slow, when measured by that of other cases in New York's congested courts, and it does not appear that the Forest, Fish and Game Commission or the counsel representing the prosecution are in any degree censurable for their conduct of the affair.

An Adirondack hunter mistook a companion's brown hat for a deer and killed his man. Another shot at a plaid shirt which he thought was a deer, and killed his victim. And so the record grows. If human beings do not escape being taken for deer, how may immunity be expected for a chance elk or moose sighted by one of these premature shooters? The Forest, Fish and Game Commission have placarded the woods with poster warnings against the killing of the introduced game; and they might well add a warning against shooting before the shooter knows that it is a deer and not a man nor a moose.

That is a very suggestive note which Mr. Durlin sends from Wisconsin of the shooting grounds of Lake Mendota, which have been planted with wild celery, with the result that the canvasbacks now resort thither in a good supply. This is one expedient of practical game stocking which is open to shooters in very many localities; and the success of the Madison sportsmen should point the way to others.

The Sportsman Tourist.

A Story of the Old Frontier.

BY ROWLAND E. ROBINSON.

NEAR the southern border of Vermont a little brook leaps and races down the hills to an intervale, through which it creeps in devious windings to a tributary of the Connecticut. One unacquainted with the industries of the pioneer settlers might be puzzled to account for the origin of its name, Potash Brook, which it has borne since the first settler here gathered the ashes of the fallow burnings and turned them to account in the manufacture of a marketable commodity.

One hundred and fifty years have passed since Simeon Draper made a clearing and built a rude potashery on the bank of the brook, half a mile up the larger stream from his home. It consisted of a rough stone chimney and fireplace, in which a great potash kettle was set, sheltered by a bark-roofed shed that was inclosed with logs on three sides. Near this and close by the brook, for the sake of the necessary water, three leach tubs, sawn from a large hollow elm, stood on a slanting platform of hewn plank or puncheons, from which the lye dripped into a great log trough, and near by was the important ash bin, carefuly roofed.

Simeon Draper and his son, Stephen, a lad of thirteen, tended the works by day, as far as possible, when there was less of the always imminent danger of murder or capture by prowling bands of Canadian Indians. One or the other dreadful fate was predicted by the less venturesome settlers who lived further down the valley nearer the shelter of the fortified blockhouse, but Simeon, brave to the verge of foolhardiness, and impelled by the hope of a bountiful reward, declared that he would not abandon the enterprise until obliged to do so by something more than fear of danger.

One forenoon early in May, after a busy night, Simeon stood regarding the boiling kettle with critical satisfaction for a moment before speaking to his son.

"Now, Stevy, I'll go to the house an' fetch some dinner an' supper, an' fill the vinegar bottle that's e'enamost empty. We'll need it bad if we get a speck o' potash or a drop o' lye spattered in our eyes. You keep the kettle a-wollopin', for we want to 'salts down' afore dark, so's not to have to stay here over night, only don't let it bile over. You needn't put no more water on the leaches, for the lye is gittin' so weak it won't sca'cely bear an egg, now; you won't have nothin' to do but keep the fire goin' an' the kittle from b'ilin' over; an', of course, keep an eye out for Injuns. I don't b'lieve there's one in fifty mile, but if you see any sign, clinper for home. I'll leave the gun wi' you an' 'll be back to rights," and taking the empty vinegar bottle, he set forth at a brisk pace along the footpath.

Stephen fed another stick of wood to the roaring fire and then went to the back of the shanty, where the long-barreled smoothbore leaned in a corner, from which he lifted it and fondled it with more than mere boyish admiration of a firearm, for now it was his sole companion and faithful protector. He rested it across the projecting end of a log of the side wall, and took a long aim at an imaginary Indian in the form of a stump on the rocky hillside beyond the leach tubs, then drew a finer bead on a moose flower that shone in bright relief against a black shadow, and wished that he might prove his marksmanship by actual test. But such a waste of precious ammunition was not to be thought of even if the report would not be certain to bring his father hurrying back in needless alarm. As a bear would not shamble forth nor a wolf sneak into the open from the woodside where a company of jays were berating some object of their dislike, he contented himself with opening the pan and examining the priming and adding a few grains of powder from the engraved powder horn given his father in Connecticut.

A premonitory slop of lye on the hot embers hastily summoned him to his duty. He partially quelled the riotous liquid by vigorous dipping and pouring with the long-handled dipper. He paused in his work to listen to an unfamiliar bird song that caught his ear above the crackling roar of the fire and the muffled wolloping of the kettle and the churning of the little waterfall in its hollow basin. It was a merrier sound even than the babble of the brook or the musical tinkle of the lye in the great trough, for it was the song of the first bobolink that had discovered the new clearing, rejoicing over its desolation of blackened stumps and withered fireweed, wherein, perhaps, it saw the greenness and bloom of future summer meadows. Three years had passed since the young pioneer heard a bobolink singing its blythe chorus in the sunny fields of old Connecticut, and it brought an ache of yearning for the pleasanter and easier life in the older settlement. Yet it was a signal of conquest well begun, and a promise of victory over savage nature. The boy's abstracted gaze rested on the scathed clearing, the brook, robbed of all its beauty and choked with brush, the greening border of the forest, yet he saw not there but a vision of smooth meadows and pastures and a clear stream winding between green banks. The turmoil of the boiling lye recalled him to his duty, and he began dipping and pouring again, too intent upon his work to look behind him for the cause of a nearer outbreak of clamor from the jays. A moment later a smart tap on the shoulder made him turn his head with a sudden start, which was succeeded by a sinking horror when he found himself in the presence of two stalwart Indians. The face of the nearest wore an almost good-natured expression as he regarded Stephen's consternation and complete helplessness. The other was a wicked-looking savage whose beady little eyes glittered with a snaky, murderous light, and he fingered his tomahawk in his belt as if he could hardly restrain the desire to use it.

"Boy no good watchman camp," said the first, broadening his grin. "Injun ketch now. Boy walk in woods 'long me. Me makum good Injun."

As he spoke he handled a thong of moose hide, the use of which Stephen understood, and to "walk the woods" he knew meant to be taken through the wilderness to Canada. Both Indians cast furtive glances upon the boiling lye with a curiosity their stoicism could not conceal, until abandoning the attempt the spokesman asked, pointing to the kettle:

"What call um? Pastoniac make um lum?"

Impelled by an impulse of self-preservation, the consequences of which he did not pause to consider, Stephen answered:

"Yes, yes! Want to drink some?" and raised the half-filled dipper with a gesture of invitation.

Both stooped toward the proffered draught, each blowing at the steam and shrinking a little from immediate contact with the hot vessel. A means of escape flashed through the boy's mind which he put in execution as soon as conceived. Withdrawing the dipper a little, he flung the contents full in the faces of the Indian, then leaping out at the opposite side of the shed, he sprang away at full speed for home.

The one on the further side received the larger share of the scalding caustic fairly in the face, and was completely blinded by it, while the other was struck upon one side and made immediate use of his uninjured eye to take a flying shot at Stephen. Half-blinded, wholly surprised and tortured with excruciating pain, his aim was wild, and the ball went whistling high over Stephen's head. His companion, bewildered by the sudden blindness and suffering torture as exquisite as any his people had ever inflicted on their captives, groped away from the noise of fire and seething kettle till the sound of the running brook caught his ear, when he staggered toward it and plunged into the water.

Simeon Draper, alarmed by the report of the gun, was hurrying back with provisions, the refilled vinegar bottle and the spare gun from the house, when he was met by his son, who with few words told of his adventure. Stealthily approaching the camp by a circuitous route, they discovered the Indians still at the brook and so engaged in bathing their injured faces and with but one eye between them to apprise them of danger, that they were easily captured. There was small chance of escape when one half-blind man had to lead another totally blind, and they submitted stoically to their fate, whatever it might be.

"Red water burn plenty bad," said the spokesman, "Water no put um out."

Draper gave him the vinegar and directed him to bathe his own and his comrade's eyes with it, which, though it smarted terribly for a time, stopped the biting of the caustic and gave grateful relief.

Then Stephen, with the long smoothbore, stood guard over the captives while his father completed the boiling down of the lye to "black salts." This was set to cool and harden in a smaller kettle. Then as the sun was going down, with their prisoners before them, they marched home, hungry as wolves, for the pork and cornbread had been fairly divided with the Indians, whose appetite seemed unimpaired by their misfortunes.

Great was the surprise and thankfulness of Patience Draper when she saw her husband and son returning, safe and unharmed, although accompanied by the two savages, for she had heard the gun and had passed two hours of such agonizing dread as frontier life often brought to womenkind. The deliverance gained by her son's bold stroke aroused her devout thankfulness, yet her womanly heart pitied the suffering plight of the stolid captives, and she dressed their wounds as carefully as if these men were friends and not the relentless foes of her people.

The news of Stephen's exploit soon spread among the scattered settlers, and they came to seek confirmation of the story by sight of the captives, with their heads bandaged by good Mistress Draper, whose kindness met slight approval from most of the visitors.

"If I'd ha' ketched 'em, I'd jest ha' knocked 'em in the head wi' my ax or beetle," declared old Ephraim Long, who had been a scalp hunter and had borne a part in Lovewell's famous fight. "Sarve Injuns that sass an' they won't never pester nob'dy ag'in."

The opinion of the majority of the settlers coincided with that of "ol' man Long," yet Patience Draper continued her benevolent work, and the condition of the captives improved so rapidly that the neighbors predicted they would soon be able to murder their benefactors and then make their escape, and all increased their vigilance and strengthened their means of protection. The silent Indian indeed seemed vicious enough to fulfill the prophecy if he had the power, but the other made simple and apparently sincere expressions of gratitude.

"You good squaw. Me Cap'n Joe," he said, standing erect and pounding the breast of his blanket coat with his fist. "Me fight, plenty. Me ketch Pastoniac, plenty. Make um walk woods. Me big man. Dodosun," pointing to his comrade, "him good sojer; fight Pastoniac, ketch, plenty. Him big man, bose big men. Lee'l Pastoniac boy, half so big, ketch um bose of it. Ugh! Dat shame, plenty," and he laughed as if he relished the joke, but the unbandaged lower half of Dodosun's face looked savagely sullen.

Simeon Draper had no fear of his captives' attempting to escape in their present condition, and maintained a loose guard over them. So it happened later on that he awoke one morning to find them gone, so long departed that they must be far beyond the verge of the forest, in which it would be as useless to search for them as for a mouse in a straw stack. Except for their value as exchanges for English captives, and that they had carried away one of the guns, he was not sorry to be rid of them.

The prediction of the older settlers was verified in part and its completion still expected, yet for two years the frontier remained undisturbed, except by rumors of threatened attack. But one midsummer day when the men folks were all at work in the meadows, in such fancied security that but few had carried their guns with them, a strong band of Waubanakees suddenly swooped down upon the place, killed and scalped one man, wounded and captured another and carried off three women and five children, among whom were Patience Draper and her youngest child, a little girl not two years old. No attack was made on the blockhouse, where the families at once took shelter, and from which all but a small guard of able-bodied men set forth in pursuit of the marauders, under the lead of Sergeant Ephraim Long.

After a sharp pursuit twenty miles up the river, the Indians were about to be overtaken when they sent back one of the captured children with the threat that if they were attacked they would at once put all the captives to death. Some of the rescue party were for giving no heed to this, but a majority, among whom were those whose wives and children were in jeopardy, were unwilling to risk its execution, and it was decided to abandon the chase.

The Indians continued their route by what was known as the "Indian road" up the West or Wantastequet River, then across the "height of land" to Otter Creek, where their canoes had been secreted. In these they now embarked with their plunder and captives to the great relief of the latter, who had been hurried over the rough trail in constant fear that some of the little children would give out and be murdered by the savages, according to their well-known custom. No one of the unhappy company suffered the horror of this fear more keenly than Patience Draper, whose little girl was the youngest of the captives, and least able to endure the hardships of the journey. For many weary miles the mother had carried the child, till she was in danger of bringing upon herself the fatal stroke, the most dreaded because it would leave the child among the savages without her care and protection.

Embarked in the canoes, in comparative bodily comfort, the party glided steadily down the river, winding through the ancient forest, past shores that showed no trace of former human presence save in the worn trail of carrying places, past rock-torn rapids and thunderous cataracts. Passing the last and greatest of these, at what is now Vergennes, they glided for miles down a wide, deep channel so devious that it well deserves the name Peconktuk, "Crooked River," by which it was known to the Waubanakees as well as by the name of Womakahketuk, "Otter River." At length they came to the broad expanse of Peton Brook, the beautiful lake of lower Champlain. Here they landed on a low promontory sloping gently to the river from the rock-walled lakeward shore. In front the ragged steeps of a mountain arose from the water's edge. Far to the northward, beyond jutting capes of rock and forest, lake and sky met where dim islands lay like stranded clouds between them. To the southward the blue waters seemed compassed by low shores and sheer walls of mountain. In all the extended scene there was no sign of human life but in the brief encampment of marauders.

The next morning the Indians held an unintelligible consultation, which resulted in their embarkation for the southward. Coasting along the eastern shore, after two hours of continuous paddling, they saw before them the emblazoned lilies of France floating over the citadel of Fort St. Frederick, and half an hour later they landed on the beach near the western walls of the fortress.

Here a motley company of French soldiers, Indians of both sexes and all ages, and a similar throng of Canadians from the adjacent village, were gathered to receive the comers with various expressions of satisfaction. The Frenchmen tempered theirs with pity for the unfortunate captives, the Canadians vociferously jabbered inquiries and comments, the Indians uttered yells of triumph, and the squaws crowded about the prisoners, taunting and mocking them, and were only withheld from actual violence by the interposition of a French officer.

Patience noticed one Indian attentively regarding her with the only eye that he possessed, by which and by his scarred face she presently recognized her old acquaintance, Captain Joe. She started and would have spoken, but with an unmoved countenance he turned his back upon her and stalked away with his squaw following three paces behind him.

"An Indian's gratitude!" she sighed, and then grew sick with fear that vengeance might be wreaked on her and her little daughter for the cruel way her son had defended himself against Captain Joe and Dodosun. With this dread added to her dismal forebodings of a long and miserable captivity, she was led away with her fellow prisoners to the fort, where by direction of the officer, they were placed in a comfortable though dungeon-like apartment, and supplied with abundant food. Here they were left to themselves, except when some inquisitive visitor came to stare at them. Once a black-robed priest with a crafty, smooth-shaven face, stole in, cat-like, and closely scanned each face, dwelling with open admiration upon the pretty features of little Nancy Draper.

"She is a child of great beauty," he said in English. "We will place her in the convent and the good sisters shall make her to be a Christian."

Patience drew the child closer, as if to shield her from a fate so abhorrent to her own belief and the priest passed on.

At night, a small lamp hanging on the wall was lighted and the captives laid themselves down on a litter of straw on the stone floor, the most comfortable beds they had enjoyed since their captivity, and soon all were asleep, save Patience, whose anxieties were too great for repose. Some time had elapsed when she saw an Indian cautiously and noiselessly enter the door, followed by a squaw and pappoose, both closely wrapped in a blanket. To her surprise and alarm they came directly to her, and the man said in a low voice:

"Come 'long me. Me take you. Dlaper. You know me. Cap'n Joe. Me no forgit flien'. Put um squaw blanket on. Covel up lee'l' gal. Come."

The squaw threw off her blanket and Patience saw that what she supposed was a pappoose concealed beneath it was only a make-believe bundle. She hesitated a moment, then arose and took her sleeping child in her arms, when the blanket was thrown over both, covering her head so as to conceal her color and features from casual observation. The squaw was quietly lying down in her place as she followed the Indian.

They passed a French soldier who stood on guard outside the door, but he barely noticed their exit, so freely were the Indians permitted to come and go. Her guide led on through several rooms and passages to a stone staircase, descending to a heavy, oaken door, where a white-coated soldier stood under arms with a lantern at his feet. At a word from the Indian he unbarred and opened the great door, holding the lantern to light the way down another short flight of stone steps, the water gate of the fortress, and the glitter of wavelets shone at their feet. A canoe was lying there, and at a motion of her companion, Patience stepped into it, when he drew the stern toward him and got on board.

"My brother and sister go forth late," the soldier said, speaking in French, as he stood holding the lantern at the head of the stairs.

"To spy the Pastoniac, squaw sell um baskets," the Indian answered, laconically.

"Oh, I comprehend," the soldier laughed, softly. "My brother is a fox. Good voyage."

The Indian turned the canoe and paddled straight away till the clang of the closing door was heard and the light of the lantern no longer shone out on the lake. Then changing his course to the southward and tending toward the eastern shore, he paddled swiftly and silently until the fortified windmill south of the fort loomed darkly against the sky behind them.

"Pastoniac squaw no 'flaid?"

"No, Cap'n Joe, not of you."

"All safe w'en we by Carillon, s'pose we no meet Iliquois. No hunt um white squaw. Kill um Waubanakee. My folks plenty mad w'en fin' um squaw gone—pappoose gone. No kill um, Cap'n Joe. Cap'n Joe good sojer. Dey t'ink we go oder way. Me only 'flaid Iliquois."

At last they saw before them the lights glancing from the embrasures of Fort Carillon. Enjoining perfect silence, Captain Joe kept the canoe still closer within the shadow of the uneven shore, till the fortress lights shone like stars far behind them, and the musical monotone of the neighboring cascade fell to a distant murmur. At length they entered a river-like channel, seemingly wide in the illusion of dim starlight, yet was but a slender waterway between rushy borders. Into one of these masses of rank growth, the Indian suddenly drove the canoe by one vigorous stroke of his paddle, whispering:

"Stoop low! Canoe comin'."

Wondering by what sense he had discovered its approach, Patience peering through the palings of rushes, saw it glide past like some ghostly craft, so noiselessly was it propelled by four dusky figures, from one and another of whom an occasional low-spoken word fell in a harsher tongue than the liquid dialect of the Waubanakee. When the wake of the canoe no longer stirred the water growth beside him, Captain Joe whispered:

"Iliquois go scout 'loun' Carillon. No git um Cap'n Joe scalp dis time." Then backing the light craft into the channel, he resumed the voyage.

As the eastern stars began to pale in the light of morning, he turned into a channel whose devious course, covered with lilypads, barely gave passage to the canoe. Now a heron launched itself awkwardly into the air within the canoe's length of the prow, now a flock of summer ducks sprang to swifter and noisier flight before it, and now a deer, disturbed at its early feast of lilypads, splashed and floundered through water and mire to the shelter of the forest, uttering loud whistles of alarm, till at a place where water and shore met, the voyage at length ended.

The canoe was carefully secreted and after a couple of hours of sleep and a breakfast provided from the Indian's pack, the party began a weary journey through the forest, wearisome even to the hardened muscles of the Indian, for much of the way he carried little Nancy upon his shoulder. Without other adventure than the hardship incident to such travel, they came to the upper waters of the Otter, and in a hidden canoe made an easier stage of their journey. After another long march on the trail of the "Indian Road," toward the close of an August day, the light of a clearing broke through the twilight of the forest before them, where, with inexpressible joy and thankfulness, Patience Draper saw the smoke of her own chimney drifting up toward the evening sky, and at the further end of the stump-blackened meadow saw her husband at work, and on the rude ox cart with its lading of new hay a lesser figure she doubted not was her son.

"Way good, now," said her faithful guide. "Me no go furder. He see me, ol' Long shoot me, mebby. Goo' bye."

"No, no, go with me! Come home an' eat an' sleep an' rest. No one shall hurt you. I'll tell them all how good you are. Come on."

With some hesitation he made as if to follow, and she hurried forward, leading her child. Speaking and getting no answer, she looked back, but caught only a glimpse of Captain Joe as he vanished in the shadowy verge of the forest, and so passed forever from her sight and ken, but never from her grateful remembrance.

ROWLAND E. ROBINSON.

In the Faroe Islands.

(*Continued from page 363.*)

ALTHOUGH I spent several weeks at Hans Kristoffer's, in Midvag, I fished only four or five times in Sorvags-vatn. The lake was a mile from the house; it was the season for storing peats, when young and old are busy on the moors, and how can a woman fish alone with any pleasure when three bulls are grazing on the lake shores, and there are no fences or walls to climb over? I did not even try, but waited until the last peat was stacked in the "gróthus," and the very next night, Jegvand, Jr., Heine and I went fishing.

During the summer, the youth of Midvag seldom fish during the day. From 8 P. M. until 1 A. M. in June and July, and from 7 to 10 P. M., and 2 to 4 A. M. in August are the hours preferred. An inconvenient time, one might think, but the Faroe people seem to lay up sleep in winter as a bear does his fat in summer, and they are able, without difficulty, to turn night into day. The tackle used consists of a stout pole, coarse white line, and large hooks baited with angleworms, and the trout are jerked violently from the water with no attempt to play them. Jegvand and Heine, however, had made much lighter rods and primitive reels, and they fished in more scientific fashion.

I left my fly-rod at home that evening and took a greenheart rod made by Hardy Brothers, of Alnwick, England. By changing the tips this served admirably for both bait-fishing and spinning. Jegvand and Heine were to take turns in rowing and fishing. Their method was to trail a rather small hook baited with angleworms, at a distance of about forty feet from the boat. I had a light braided silk line, stout leader and an Abbey & Imbrie "spinning coachman." Numbers was our object. It was not a time to experiment with fly-fishing at night. Fru Hans Kristoffer expected relatives from Bó to dinner on the morrow—Sunday—and she had requested us to bring home enough trout to make a large dish of "frikadellas." These are a glorified kind of fish cake. I would give the recipe, except for my conviction that no native-born American would have the patience to pound and whisk the ingredients for two hours and a half, and so produce that creaminess and lightness indispensable to the ideal frikadella.

There is a charm and mystery about these night fishings. It is broad daylight until 11 o'clock, with wreaths of rosy mists about the bare fjelds, and the higher peaks glowing with flame and copper hues. Then for two hours is a clear silvery twilight, with every object distinctly visible. One waits, unconscious of the passing time, for it to grow darker, but it lightens instead and another day has come. As we pass, the ever-watchful curlews give the alarm, the oyster catchers answer and the golden plover; there is a chatter of titlarks, wrens and stonechats, and a few ravens and crows hurry from the cliffs to see what is the matter. The gulls, terns and kittiwakes are all astir, eider ducks are taking little excursions in groups of five or six, and now and then a puffin flies over, straying from his quarters on the bird crags above the sea. It was so light that I am sure an expert fisherman could have taken many fish by using a small white or yellow miller, such as one would choose for early twilight fishing in America.

During the first hour I caught eight good trout, and Heine, whose turn it was to fish, not one. Heine (aged sixteen) is a born fisherman and something of a misogynist, considering woman of small account except as she provides food and clothes to man, and so enables him to live and fish. He had never spoken to me (Jegvand did the necessary talking), but I always had hopes of softening his heart. Heine takes his fishing seriously, and I realized that unless he could catch something soon, the situation would be critical. So I lent him an Abbey & Imbrie capelin minnow. He caught five nice fish in half an hour, all larger than mine, and the danger was past. And that night, when he returned the minnow, his lips were unsealed. "Thanks shall you have!" he said with haughty grace. "That's a remarkably good little fish!"

We came stealing into the silent house at 1 A. M. with twenty-eight trout, weighing from three-quarters of a pound to two pounds, every one a fighter and in fine condition. Our dish of frikadellas was assured.

A few years ago a young Englishman spent a month in the Faroes, and then wrote a book about them. In it he gave free rein to his imagination. This was a pity, for it caused inconvenience and disappointment to others who naturally wished to catch scores of trout averaging three pounds apiece, and to shoot large bags of curlew, oyster catchers, snipe, and plover during a short stroll. The courteous governor of the Faroes has received and answered many letters asking if these tales be true. One less prudent sportsman, an Anglican clergyman, did not inquire, but came, shot a snipe the morning after his arrival, and was promptly haled before the authorities. The above-named birds cannot be shot before Sept. 15, too late for travel among the Faroes. As for the fish, those "finny montsers of Sorvags-vatn," Hans Kristoffer testifies that he has never seen anything bigger than two pounds and a half. The Sorvags-vatn fish, however, are not to be despised. They are the *Salmo fario* (the river trout of Europe), gamy, pink-fleshed and finely flavored, and under favorable conditions a large catch can be made. A few days after our first fishing, Heine had a regular fishing orgie, an all-night affair, and caught sixty, ranging from one-quarter to one and a half pounds.

As near as I can ascertain, there are nine or ten fishing lakes in the Faroes, not counting a number of tarns where small trout are often taken. Fjalla-vatn and Kvittla-vatn, two lakes in Northern Vaagöe, have fish which, though not so numerous as those in Sorvags-vatn, are heavier—but there is no shelter at these lakes of any kind, and the way to them is rough and fatiguing. There are both sea and river trout at Leinum, Saxen and Stromnoes or Stromöe, Eide or Osteröe, and Sand or Sandöe, and I am sure there must be many an inlet and bay still unfished with light tackle where sea trout might be taken. But the difficulties of Faroe travel are great. In many places steep fjelds prevent land excursions, and storms make excursions by sea impossible for weeks at a time. The life insurance companies of Copenhagen certainly do not underestimate the risks of a Faroe life. Their charges are five times greater for Faroes than for Denmark.

When I left Hans Kristoffer's it was to go to Leinum, on the island of Stromöe. Here there are three small lakes connected with one another and with the sea. Waders and a boat were necessary here, and I had neither. There had been little rain, and the sea trout had not begun to run. Also, lest I do injustice to Faroe fishing, I might as well confess that I cannot cast a fly well. My line often falls on the water with a distressing splash, and I cannot cover much water with it. Had I been willing to use worms, I might have taken many little troutlets, but I persisted in fly-fishing, and the truth is I did not catch a thing. It was a time of humiliation, emphasized by the fact that the small boy who accompanied me, with a touching faith, always carried a bushel basket. It was some time before it occurred to me that this was intended to hold my fish.

To wait at Leinum for rains that might be long in coming, was not wise, and after two days I started over the hills to Stromnoes, a half-way hamlet on the route to Saxen. No one who cannot take rough tramps can really see the Faroes. My walk that day was a typical one. Two men carried my traps in "leipur" on their backs, and I trudged on behind, with skirts kilted and fjeld staff in hand. We followed the brook and lake shore for a mile and a half, and then climbed slowly upward for an hour. A keen wind met us on the summit; the air was clean and fragrant with peat and wild grasses. We passed cow limit, then after a half-hour or so, the further sheep lands, and reached the lonely higher ranges, toiling over stones and hillocks, through matted grass and boggy spots where the feet sank deep in sphagnum mosses. For the first two hours I paddled along in a state of active Nirvana, thinking of nothing in particular, vaguely conscious of the skirling of curlews and terns, and the plaintive "dee-e!" of the golden plover. The sweet rain whisks against my face and the sun lays a warm hand on my shoulder. I feel like a primitive person, a nomad, with none of the cares and worries of civilized life. The two figures on ahead are members of my tribe, bearing our few worldly possessions, only—were I a true primitive person, I, as the woman and beast of burden, would be carrying the pots and skins and kettles.

Then this beatific mood passes, and tired muscles protest against the toilsome work. We stop to rest, and I curl up in a hollow and eat black bread and dried mutton, and find that the best "pick-me-up" is cold tea, East Indian tea, in a bottle with plenty of sweet cream in it. Then on again, feeling a kind of satisfaction (to quote Thomas Hughes) in "the consciousness of silent endurance, so dear to every Englishman, of standing out against something and not giving in."

It is slow work, over four hours for eight miles, and one's brain wearies of using one's judgment continually about the deepness of boggy spots and the wobbliness of hillocks. At last sheep come in sight again, then cows, and as we dip down to lower levels, from the fjord comes a breath of salt air, and peat smoke from cabins still hidden below the rocky ledges.

Though I have never heard Stromnoes recommended as a good fishing place, I feel sure that sea trout could be caught there. I dined from delicious fish which my hostess said were caught in her husband's herring nets—and there were all the conditions for sea trout, a sheltered fjord, a clear, swift stream and a tarn or two at its head among the hills.

Next day I left Stromnoes for Saxen, walking over easier ground for six miles. As we approached, dark fjelds closed in upon a narrow valley, a brook tumbled over and between boulders, flowed through a lake, and with many a fall and rapid to the sea. It looked very trouty except for the lowness of the water.

Saxen I found to be a three-house hamlet. The house where I stayed had its peculiarities. There was a rooster who crowed every two minutes after 1:30 A. M.; a cow homesick for the "out-fields," and a calf whose lamentations had no beginning and no end, and all three lived directly under my bed, with only an open flooring between us. The number of exasperating things that calf did! He snuffled and snorted, thumped my floor with the top of his head, bellowed and grunted and rolled a wooden bucket about. In the morning I protested; my hostess suggested mildly that I "might get used to it," but I assured her that never while life remained could I get used to such a calf. They were kind people, and thereafter at 10:30 P. M. the calf and the rooster were borne away to other quarters, the rooster protesting indignantly, and the cow and I put up with each other's society.

Then followed a tiresome week of waiting for the sea trout to come. The water near the lake was shallow and with no boat or waders there was small chance of any good-sized lake trout. The stream was shrunken, and the empty nets in the bay testified to the absence of sea trout. I had a gourmand's interest as well as that of a fisherwoman in catching fish, for I grew very tired of kittiwakes for dinner, and the only alternative was last year's whale's meat. Every day at 11 o'clock I heard the report of a gun, and soon a pretty kittiwake in a dying condition would be shown to me, and I ate it at 2 o'clock, feeling like a Moloch or a Juggernaut.

But at last came a mighty west wind, bringing with it the blessed rain, and all the burns and cliff waterfalls awoke and made a chorus up and down the glen. I took my rod and splashed through the puddles toward the inlet, glancing as I passed into a pool which had always seemed promising. Yes, there were fish in it; a little one, a larger one, and in the shadow of a boulder a vague shape that might be a large trout. The sea trout were coming from the sea. I quietly slipped on a grizzly-king and a professor, and cast across the pool. At the second cast the medium-sized fish took the fly and I landed him after a sharp fight, a beautiful pound and a half trout. A few minutes later there was a swirl and a big fellow darted out at the fly, but the little one was ahead of him and was taken in short order. Then I went away for twenty minutes, put on two new flies, tested the tackle and did my very best to throw the flies lightly in the shadow of the boulder. In an instant I had him fast; he moved slowly away a few yards, then jumped high from the water, a great shining bar of silver, fell back heavily and diving under a sharp ledge see-sawed the leader against the edge; at last it parted, the fish was away with my two flies, and I sat down on the ground and groaned and said unpleasant things to myself for hesitating to risk my light rod and force him out. An experienced angler might have done it, but my Hardy guinea rod of eight ounces was a new one, and I did not know then how much it would bear.

That ended my day's fishing, but I dreamed of big trout, and next morning made extensive preparations, and with a small boy to help, stole softly down to that pool, hid behind a rock and peeped in. I could count twelve fine sea trout, all lying in the bed of the pool and swaying lightly to and fro in the strong current.

And then I began to fish. It was not easy work. The best place from which to cast was on a sloping boulder, where I was almost hidden behind a great mass of rock. I had to cast over this, wait to see that the fish was firmly hooked, and then in the few seconds which elapsed before he realized that fact, pass the rod over the rock, keeping the line taut as I climbed over several slippery rocks, and reaching the strand, face about just as he began to fight. I had never fished for sea trout before, and had always supposed that the Canadian Nepigon trout were the gamiest in the world. But I have never seen such wild rushes, high leaps and lightning speed. I was no longer afraid to trust the rod and found I could check the fish as they made for the sea. But it was lively work. Such beautiful creatures they were! like burnished silver with a little blue-green down the back. I had unfortunately left my landing net at Midvag, and I had to tire them out and then lead them cautiously up to one little piece of sandy strand where the small boy could go in the shallow water and secure the fish. And never have I seen a stupider specimen than Paol Jens. He stood each time like a graven image, not moving a finger until roused to action by my fierce wrath. He will never make a fisherman! Heine, of Midvag, at the age of three, would have known just what to do, and how to do it. But there were times that morning when I had murder in my heart toward Paol Jens.

During the next two hours I caught seven out of the twelve fish. In weight they ranged from one and a half to almost three pounds. I think I might have taken several more, but I was quite exhausted by that time, and had to go home for dinner. The largest and wariest fish were still in the pool, and I noticed that the heavier the fish the redder was its flesh. Even in the water one could see the pink and copper tints gleaming through the silver skin. They weighed probably from three to six

pounds apiece. The water was very clear and I could see them distinctly as they poised themselves lightly in the current or made little tours around the pool, rising now and then at a midge or fly. I would return, I decided, in an hour, refreshed by my kittiwake dinner, and try to catch at least three of those big fellows. But I reckoned without Paol Jens. While I was eating my kittiwake, that miserable boy awoke to a misplaced activity, took his heavy fishing pole and line, and thrashed the surface of that pool, scaring away every fish in the neighborhood.

I had but one day more to spend in Saxen, as I was obliged to be in Westmanhavn on the following day in order to catch the little Smyril. Early next morning it blew a gale, but I was early at the pool, only to find that a man had stretched a net across it. Two beautiful sea trout, weighing five and six pounds, were in it, caught by the gills. Further up the stream I took three sea trout of a pound and a half apiece, and half a dozen river trout. But by that time the storm had increased, so that the flies were whisked high above the water and I almost blew away up the glen; and the men of the house sent word that the Froken must come home and rest; that she did not know what it meant to walk from Saxen to Westmanhavn.

There are undoubtedly big fish at Saxen, but they are not taken in large numbers. Generally every year two or three Englishmen find their way to Saxen, provided with tents, folding boats, waders, and a skillful oarsman and interpreter from Thorshavn. By spending most of their time on the water, two rods may take seven or eight large fish during the day, some weighing as much as eight pounds, and perhaps a fair supply of the *fario* trout. A skillful angler who can cast a long, clean line would undoubtedly get some big fish without a boat. But the man with a boat or servant will have the best sport.

In leaving Saxen for Westmanhavn, one can go twelve miles by sea, if the sea is calm, or nine miles over the fjelds. I had intended to take the former route, going in a large boat with eight oarsmen, on a serene day, the afternoon sun gilding the wonderful peaks and crags of Western Stromöe, I taking kodaks and sketches on the way, and my men lifting up their voices in song. Three months of adverse experience had not taught me wisdom. Instead, I went, as might have been expected, by land, in a howling storm. All the waters were out, and four times one of my men, a giant of a Faroese, had to carry me through the streams, I rejoicing in the meantime in the bigness of his calves. There are, I believe, fine views to be seen en route in good weather, but I saw nothing but shifting gray walls of mist, and it rained "shoemaker's apprentices"—the Faroe equivalent of the English "cats and dogs."

A few days later found me on the way to Sand or Sandö, where I hoped to catch one big trout before returning to Thorshavn. As we passed down the western side of the island, the captain of Smyril pointed out the place where the ill-fated Principia was lost in November some years ago. On that same night I had left Thorshavn on a Danish steamer. We had passed on the other side of the island at the very hour when, hidden from all help behind the cliffs of an uninhabited coast, the Principia was burning. Out of all the crew and passengers, one only was saved after drifting for thirteen hours lashed to a plank. And that same night a clergyman in Scotland, whose brother was on the ship, saw her in a dream; saw the fire amidships, the life boats burned, a hastily constructed raft overturned and wrecked in launching, and his brother jumping into the water. He woke with the words "Faroe Islands" sounding in his ears. But he knew nothing of the Faroe Islands, and thought the ship was hundreds of miles south, bound for America. He told his old housekeeper his dream next morning, and six weeks later when the post came from Faroes, he heard that a fire had broken out on the Principia, passengers and crew had fought it for three days; they could not steer the vessel, and a southwest gale had driven it far north; and there, burning, she was dashed to pieces against the cliffs of Sandöe. When I went to Midvag, I found that it was Jegvand, Sr., who had found the brother's body and helped to bury it. "A fine man, a *kraftig* [strong] man," said Jegvand, sadly. "He had a life belt on, but there was little chance for him; of all the wreck that came ashore, not one piece was big enough to use. It was in splinters. There was great surf that night. I have never seen worse."

I post this letter from Thorshavn. I accomplished my mission to Sand and caught my big trout. Only one big one, to be sure, among a number of small ones, but he was a fish to satisfy the most exacting, a beautiful sea trout, fresh from the bay, caught with my light rod and a small green-mantle fly. He weighed a full five pounds, and we had a long and fair fight. And then a fierce equinoctial storm arose, and—little Smyril was due before it was over. Each day I watched the surf, and talked with old sea dogs, who were digging their potatoes, about the prospects of my being able to board her if she came. They were unpleasantly optimistic. "Don't be afraid, Froken," they said. "We'll get you on board somehow! Yes, unless it gets worse (though it won't be pleasant) we can do it!" And I could only hope and pray it would get worse and so make the attempt impossible.

But Smyril came at last, the old sea dogs put me on board "somehow," and that trip to Thorshavn gave me a fellow feeling for the voyagers of the "Lotus Eaters"—

> "Most weary seem'd the sea, weary the oar,
> Weary the wandering fields of barren foam."

The little capital, after my four months' absence among the lonely islands, looked cosy and hospitable. There was the hum of voices, the clatter of pattens in the narrow lanes; lights twinkled in the grass-covered cabins and on a fleet of fishing smacks from Iceland—Norse, Scotch and Faroe—that had taken refuge from the storm. The baker was making his Saturday evening crullers and little cakes. I could smell the spices in a whiff of land breeze. The cheerful voice of a friend greeted me in English as, chilled and tired, I stumbled out of the boat.

It is good to be back again. ELIZABETH TAYLOR.

"Curious thing about a man with a watch is that if you see him take it out and look at it, and you ask him two seconds later what time it is, he never remembers. He has to look at it again."

"Yes; I've noticed that he'll always do it—if his watch is a fine one."—Chicago Tribune.

The Wild Horse of the Banks.

THERE is really no more historical as well as interesting and curious territory in the United States than the long sand banks which mark the eastern boundary of North Carolina, and which form a vast breakwater, within which are the "sounds" through which the Government now proposes to provide an inland water-way which will end the terrors of Cape Hatteras.

This is to be a story of that part of the banks further to the southward of Cape Hatteras, where the little ponies are, the only wild horses east of the Mississippi; ponies which have over three centuries of history behind them, and which date back to the time of knightly Sir Walter Raleigh and the days when the Moors of Barbary were a power.

The part of the banks in question is known as "Shackelford's banks," taking its name from the chief owner. Beginning at Ocracoke Inlet, this stretch of sand reaches to Bogue Inlet, terminating at Shackelford's Point, in front of the town of Beaufort. Shackelford's banks are almost forty miles long, low-lying, with here and there dunes or sand hills, rising to a height of say forty feet, tree covered, the trees loaded with vines, and in this mass of nearly sub-tropical vegetation, much of it evergreen, are the Spanish bayonet, prickly pear or small cactus, and the fan, or scrub palmetto. There are homes here and there along this irregular stretch of Shackelford's banks, and there is also a lighthouse and near it a natural harbor of refuge, at Cape Lookout, which the Government is also planning to utilize.

On Shackelford's banks alone are the little ponies referred to. It is strange but true, that they are found in their wild state nowhere else. There are said to be about twelve hundred of them on the banks. Inquiry made of residents as to whether the number of ponies had decreased during the past fifty years brought the response that it had, and that until about 1850 the ponies increased. The ponies weigh about 800 pounds, and their height is about thirteen to fourteen hands, that is, 4¼ to 4½ feet. Their life is mainly on the banks, though in very stormy weather they sometimes swim over to the mainland, a distance of from two to five miles away. Their food is marsh grass, sea oats, leaves of scrubby trees, and shrubs and berries, particularly the berries of the holly. The woods give them usually a good shelter, and hence it is seldom that they seek the shelter of the mainland. They live to quite an age, but the average is about 22 years. Some reach the age of forty. When they want water they paw holes in the sand in low places, and get plenty of it.

These ponies have owners. The "Banks" are owned by various persons, largely upon grants sold by the State. These people make pens out of drift wood and rough logs and poles, and into these the ponies and their colts are driven and branded. A colt following a branded mare is considered the property of the owner of the mare, and he brands it. In cases where there are colts which do not follow the mares, then the "penners," that is men who make and own the pens, take them. Such is the unwritten law. The ponies are driven out of the scrub by drivers or herders, and this is a matter of no small difficulty, as the scrub is often so thick as to be jungle, threaded by thousands of narrow paths through the shining sand. The wind and salt keep down much of the vegetation, so that there may be seen hickory trees not over three feet in height, yet loaded with nuts, and horse chestnut trees equally as dwarfed.

The colts are covered with hair several inches in length, a nature's protection against the weather. This is called colt hair, and looks like felt. It falls off in large flakes. Most of the colts are of a faded brown color, but are sometimes black. They are termed colts until they are branded, though they may be three years old or more before they are pennned and the brand put on. These ponies are always known in all parts of the State as "bankers" ponies. They do not appear to be sold much outside of North Carolina, as the people in other States do not know anything about them. They cross well with horses. When taken up-country and fed upon corn, hay and oats they fill out and darken in color somewhat. Their instinct is remarkable. They know by means of it the way to get to the mainland or to islands with the minimum amount of swimming, and the writer has seen them wade great distances without getting out of their depth, making various turns and changes of direction to conform to the shoals, yet they are fearless swimmers.

Though an inlet only about two miles in width separates Shackelford's banks from Bogue banks, yet the ponies never go on the latter banks, nor do they cross the Ocracoke Inlet.

Ancestors of these hardy and valuable little horses were the Barbary horses which Sir Walter Raleigh sent over with his colonists to Roanoke Island. They have bred and multiplied, and for at least two centuries have been utilized by the people of that section. Sir Walter Raleigh's colonists, when the relief from England was so long delayed in reaching them, went with the Indians to the mainland, but must have left the ponies. The Indians were unused to horses. These Indians were the Haterasks, who gave their name to the dreaded cape. When Raleigh's colonists first landed there they found that the Haterasks were distinguished by their blue eyes, and that they had a tradition that their "fathers could talk out of a book." Hence the inference that at some former period a crew of white men had been cast away thereabouts and had amalgamated with the Indians.

These sturdy little ponies are, therefore, a part of the romance which hangs about this quaint part of North Carolina. There are persons who hold that Raleigh's colonists first landed on Shackelford's banks, and later went to the "Isle of Roanoke," where they built their fort because it was a more defensible place, and that they left the "little Barbary horses" on the banks until better times should come. FRED. A. OLDS.

In a Restaurant.—He—"Will you have a little lobster?" She—"Oh, John, this is so sudden!"—Philadelphia Evening Bulletin.

Natural History.

Life of the North.

THE last issue of North American Fauna (No. 22), the publication of the Division of the Biological Survey of the Department of Agriculture, contains a paper of unusual interest. Prepared under the direction of Dr. C. Hart Merriam, the Chief of the Division, it was published Oct. 31, and gives an account of a "Biological Investigation of the Hudson Bay Region," by Edward A. Preble.

For more than a century the employees of the Hudson Bay Company used to send collections of birds and mammals from Hudson Bay to London. These were examined and described by naturalists, for, of course, the new country gave many new species. Many of the specimens from which the description were drawn have now disappeared. and often the specimens were without labels showing just where they came from, so that really little more was known about them than that they were secured in the northern part of North America. No modern museum possessed anything like a representative collection of the mammals and birds of Hudson Bay, and this became a matter of great importance when the Biological Survey began to receive large collections of birds and mammals from Alaska. Without specimens for comparison, it was impossible in many cases to tell whether the Alaska specimens were or were not different from those described long ago from other parts of boreal America. In view of this embarrassment, Dr. Merriam decided to send an expedition to Hudson Bay in order to collect the topotypes that he so greatly required, and Mr. Preble was chosen for this laborious task. The report just published, containing about 125 pages, is the result of this expedition. It shows that the work was well performed, and is full of interest—a useful contribution to our knowledge of the north.

The party, consisting of Mr. Preble and his brother, Alfred E. Preble, as assistant, started from Winnipeg June 14. At Winnipeg and throughout their journey thereafter, they were everywhere assisted by the Hudson Bay Company and its employees. Without this assistance the trip would hardly have been practicable. They crossed Lake Winnipeg by steamer and reached Norway House June 17. Here they procured Indians and a large Peterboro canoe, and from Norway House, starting down Nelson River, they passed by river and lake to Hudson Bay at York Factory. Here they exchanged their canoe for a sailboat, and proceeded up the west coast to Fort Churchill. The younger Preble remained there to collect, while his brother pushed northward to the Barren Grounds. This trip occupied three weeks, and on his return to Fort Churchill it was necessary to start on the return journey, to avoid being shut in by the winter.

Mr. Preble describes in some detail the character of the country traversed and illustrates it by a number of capital photographs; the plates in the volume, numbering fourteen, beside a map, on which the route is marked, showing the whole of Hudson Bay and extending west as far as Bathurst Inlet and Aylmer Lake. He tells something of the life zones of the region passed through—from Winnipeg successively the Canadian and Hudsonian zones, and well into the Arctic. Above Cape Churchill the Arctic zone is continuous on the coast, as shown by the birds and the mammals collected there. A more or less brief review is given of the previous work done in this region, and a bibliography beginning with Edwards, 1743-51, and ending with Oberholser, 1902.

The report treats chiefly of the birds mammals and batrachians of the Province of Keewatin, though, of course, there are many references outside of those limits, since the travels of some of the Arctic voyagers have been used. The report describes six new species and subspecies of mammals, a mouse, a muskrat, a hare, a mink, a weasel and a shrew; and, since the completion of the trip, three other species which fall within the scope of the report have been described, two of them mice and one a form of Arctic fox. Quite full notes are given on some species in the lists of mammals and birds.

The Greenland whale was formerly found as far south as Churchill River in the bay, and still occurs further to the north. The narwhal is found to the north, and the white whale is abundant; so much so, that at the time of Mr. Preble's visit men were at work for the Hudson Bay Company capturing them at the mouth of Churchill River.

The woodland caribou is found in some numbers everywhere between Norway House and Hudson Bay, and Mr. Preble's party saw tracks frequently. Barren Ground caribou were not uncommon at the most northerly point reached, and were just beginning the autumnal migration southward. The southern limit of the range of the Barren Ground caribou on the west slope of Hudson Bay is given as Churchill River. Even in former years, according to Hearne, they seldom crossed that stream. Further inland they go south as far as the south end of Reindeer Lake.

The moose occurs in considerable numbers between the head of Lake Winnipeg and Norway House. Tracks were frequently seen, and some of them so recent that the mud had not yet settled in them.

While Mr. Preble's party saw no musk-ox, yet he brings back an interesting southerly record of recent date. It is probable that the musk-ox commonly occurs as far south as Chesterfield Inlet; but "Several times during the summer of 1897 parties of Indians reported seeing a pair of musk-oxen on the 'Barrens,' about half-way between York Factory and Fort Churchill. The male was finally killed in August, and the head brought by the Indians to York Factory." This pair had probably wandered beyond the limits of their normal range during the preceding winter, and for some reason failed to return.

The beaver is becoming scarce throughout this region, though skins are annually traded at most of the posts. Of the skins seen at Norway House, several were black.

The northern muskrat is smaller than our common form. It is extremely abundant, and though worth but a few cents in trade, many thousand are taken each year. Mr. Preble says: "The sweet flag (*Acorus calamus*), a favorite food, abounds in the Robinson's Portage, and the great number of muskrat houses seen there show the locality to be a favorite resort. We saw many muskrats

while we were descending Hill and Steel rivers. Here they live entirely in burrows in the banks, as the deep water and swift current render house building impracticable. Piles of mussel shells, showing where the animals have been feasting, were frequently noticed on the bank. The point of marsh below York Factory seemed to be the home of a considerable number of muskrats, but as it is frequently overflowed, they are said to seldom survive the winter. In the vicinity of Fort Churchill they were found in but one place—a stream entering the Churchill River a few miles above the post, and they were rather uncommon.

"A winter following a dry season is said to be very destructive to muskrats. On account of the low water, the animals construct their burrows and houses correspondingly low and are often forced out by floods at a season when they are unable to procure food, and have no protection from their enemies."

The Arctic hare was seen on the Barren Ground near Mr. Preble's furthest north, as were also white wolves. Gray wolves were more or less abundant in the Winnipeg region.

Merriam's Innuit fox was quite abundant north of Fort Churchill, and occurs through northern Keewatin. The black bear is abundant, while nothing new was learned about the Barren Ground bear. On the other hand, polar bears were seen, and are said to be of regular occurrence all along the west shore of Hudson Bay, and as far south as Severn River, and possibly to the head of James' Bay.

The walrus and several species of seals occur with more or less frequency in Hudson Bay, especially toward the north. A walrus was brought by an Eskimo to Fort Churchill only a few days before the party reached there.

Three species of loons were seen on Hudson Bay, and two others are recorded from there. Mr. Preble speaks of the noisiness of the loons, and says of the Pacific loon: "The howl of a wolf or any unusual sound was generally followed by a chorus of their wild, weird calls, lasting for several minutes.

All three species of merganser were observed. Mallards were rather abundant, and as might be expected, the list of the ducks and the geese is a long one.

Mr. Preble took near York Factory five little yellow rail, which he secured by following up their call note.

As might be expected for a trip along the sea shore, the list of beach birds is long. The spruce grouse, Canada ruffed grouse, willow ptarmigan and sharp-tailed grouse are all recorded. The rock grouse they did not see.

The list of the lesser birds is a long one and contains many interesting notes, to which the reader must be referred. A few frogs and salamanders were secured.

A New Caribou.

From the valuable natural history material brought to the American Museum of Natural History by Commander R. E. Peary, on his return from his sojourn in the Arctic region, are the skins of five caribou. Of these four are flat skins of adults, without skulls and more or less defective, and the complete skin of a young fawn, preserved in brine. On this material Dr. J. A. Allen has described the Ellesmere Land caribou (*Rangifer pearyi*), a new species, quite different from the Greenland caribou, and indeed from any other that is known. In the winter coat, which these animals still wore, when killed in June, the Ellesmere Land caribou is pure white except for a dark patch on the middle and posterior part of the back. In the single male, the dark patch on the back is drab gray, while in the three females this patch is darker, and extends a little further forward. In two of these females the front surface of the forelegs is dark grayish brown. In the fawn the contrasts in color are less pronounced than in the adult animal, and it is more or less rusty throughout. Something of this may be due, however, to the brine in which it was preserved.

In a letter to Dr. Allen, Commander Peary says that the winter coat of the Greenland caribou is pronouncedly darker than the Ellesmere specimens.

The Real Samoa.

From the New York Sun, Nov. 5.

It is a remarkable book that Mrs. Llewella Pierce Churchill has written in "Samoa 'Uma" (Forest and Stream Publishing Company). The Pacific islands, with their eternal summer and delightful natives and blissful indolence, have been a fairy land for dreamers from the day of the Mutineers of the Bounty to that of Bishop Peter. They have been spoiled by missionaries and diplomatic quarrels and ethnographers and by enthusiastic literary men. Samoa has suffered above all; it has come to mean to most of us only a senseless international wrangle, though it does recall a great heroic scene; moreover, it must bear the burden of the Stevenson cult and the reality, the little community of Pacific islanders, is lost sight of. It is this that Mrs. Churchill observed and that she tells of.

She was in an unusually favorable position for her readers in that she had no ax to grind. She was there, not as a missionary, nor a scientific investigator, nor an official, nor a poet in search of the picturesque; she was there simply as a wife who accompanied her husband whither his business led him; she was in Samoa a long time and used her eyes and her brains in finding out what was around her. The people and their ways interested her and she reports what she saw pleasantly, clearly and with no favor. The result may be disappointing to those who have closed their eyes to the savage side of the amiable Samoans and the Pacific islanders in general, but they will feel that they have now a sure foundation of fact to build on.

Mrs. Churchill, without any parade of learning, depicts the institutions of the people, their daily life, their customs, amusements, and so on, with illustrative anecdotes and incidents, and, beside, describes characteristic adventures and scenes in her experience. She also shows the effect of Pacific surroundings on the white men who drift into the islands and become entangled with the natives. After reading her book the dreamer will doubt whether it is to the Pacific that he wants to go, after all. By the side of the bread fruit and other vegetable attractions there are bugs of many kinds that sting and crawl. There are gastronomic ventures on the author's part that make the flesh crawl; she had no chance to taste a missionary, but—she tells of baked rat and vampire bat that taste like squirrel.

The pictures are from photographs and are fine. Many represent Samoan girls who are pretty enough to make the dreamer turn his back on Mrs. Churchill's narrative and take the next steamer to Samoa, vampires or no vampires.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in Forest and Stream.

A Hard Time on Old Baldy.

There is philosophy in the remark made by the man who went 'coon hunting one night when he said, "I wouldn't have missed it for a farm, but wouldn't take another one for a farm with a hay rake thrown in." E. Hough in his intensely interesting "Across New Brunswick on Snowshoes," says in speaking of "Lost Man's Camp," where they put in a night with the thermometer 21 degrees below zero, while one had to keep a good fire burning while the rest slept, "It was one of those experiences such as one would not willingly let go from his memory." It is well known and yet hard to explain why it gives so much pleasure and gratification to recall that in our experiences which was attended with so much hardship and discomfort.

I was planning for a trapping expedition one fall after I would get my work done on the ranch, and just about the time I was ready to start out, Oscar Elmes, one of my neighbors, proposed that he would take his wagon and go with me about ten miles into the mountains, in the hope that I might kill some meat for him to take home, as he was out of meat. This arrangement suited me very well, as I only had one horse at that time, which would have necessitated my walking and packing my outfit on my horse. The day we started it was raining, and before we got far on our way it began to snow, and by the time we were at our proposed camping place, there was seven inches of snow, and it was still snowing, as it can snow in the Rockies.

The discomfort began as soon as we started on our journey, and by the time we stopped to camp everything outdoors, ourselves included, was as wet as snow and rain could make it, and the prospect for anything like a comfortable camp was gloomy enough; but by the time we had worked right lively for an hour clearing away the snow and doing all the necessary work in making camp in a snowstorm, we had our blood warmed and felt better.

The next morning there was over a foot of snow, and it was still snowing. The snow was wet and heavy, making it very hard traveling, but we started out on horseback and went up over a very high and bare mountain, Old Baldy, which was in a southerly direction from camp. As we were riding we did not realize how terrible the traveling was, and we went several miles without seeing anything. That was not surprising, for we knew it would be only by the barest chance if we would find any game moving in such a storm, it being the first of the season. We left our horses picketed in a little park while we continued on our way southward. After going but a few rods from our horses we noticed a very dim trail going in the direction we were going, but we could not tell what it was or which way it was going. We followed it in the direction we had been going, and soon I found, sticking to a log, the hair from a horse's tail, and we at once concluded it was the trail of a neighbor who had gone into the mountains after meat. For the sake of easier traveling we continued on the trail, and in a short time came to the fresh trail of an elk, which had come into the old horse trail and gone on southward. After following it for some time we found where it had been lying down. By getting down and examining carefully its tracks where it had stood in its bed after getting up and noting by the condition of the snow when it had been there about where the sun must have been, we believed it must be two hours ahead of us. It was going down a very steep mountain side into an immense body of green timber, and after following it about a mile we found where it began to feed; then I asked Oscar to stay several rods behind while I got in my work, for it was very evident that his chance of getting meat was going to be slim if we did not get that elk. The snow was hanging heavy on the pine and spruce timber, which made it difficult to see far ahead; in a short time I had gone around the head of a ravine where it had been feeding, and struck its track where it had gone on down through the woods, as if hunting a place to lie down, and then I had the pleasing sensation of seeing its horns sticking up above the logs and rocks. I motioned to Oscar to stop. I was satisfied it was lying down, and getting on my hands and knees I crawled through the snow for about twenty yards; when I got to a favorable rise of the ground I rose up and could see its head and neck, and saw that it was lying down with its head laid back on its body at rest or asleep. Being then only about fifty yards from it, I took careful aim to break its neck. My gun snapped, and although the noise was very slight, he moved his ears, but did not raise his head. Being afraid to throw in another shell for fear of rousing him, I cocked the gun again, and that time it went off, and it just went "smack," seeming about as loud as the explosion of a percussion cap, and I was surprised after hearing the report to see him drop his head back on the snow, dead. Those who have shot in snow-laden timber know what a faint, muffled report it makes.

With a whoop for Oscar to come on, I went down to find a splendid bull, probably two and a half years old, nice and fat, with its neck broken, which allowed it to bleed when stuck, just like a beef, and as the snow kept everything about it nice and clean in dressing, it was the finest and cleanest woods dressed meat that I ever handled. By the time we got it dressed and got back to our horses, we had to go lively to get back to camp by dark without going back for our meat. The next morning was rather warm, and the snow was just soft enough to make hard traveling. We went leisurely out after our meat, believing we had an easy job before us. It was about noon when we got there, and we ate our lunch before packing our meat; then we packed up and started on what proved to be the most tiresome trip that I ever took. Instead of following our back tracks, that we might have a broken trail to help us, we thought to take an easier grade in going back, and therefore had to wade through the unbroken snow for fully six hours, in soft snow up to our knees all the time. By the middle of the afternoon we were taking short turns at taking the lead, as the one in the lead had much the hardest work. We were both well nigh "tuckered out" by 4 o'clock, but as is always the case, neither of us wanted to "squeal." When we were within a mile of camp, we had passed beyond the point of ignoring our distress and began to speculate as to whether or not we would be able to make it to camp. We worried along till within eighty rods of camp, and it was getting dark, when Oscar sat down on a log and said, "I cannot go any further." I was in the lead at that time, and when he declared himself done up, it kind of nerved me up, and I just forced one foot after another, and reached camp without making another stop, intending to unload my meat and go back after Oscar with my horse. When I got to camp and looked back, I saw Oscar plodding along in my trail. When he reached camp he just flopped down and left his horse standing with its pack; I told him I would not sit down until the horses were relieved of their packs. After resting a little he got up and helped to unpack his horse, then tumbled down into the tent, where he stayed until I built a fire and made some coffee. Immediately after getting into camp I became sick at my stomach, and never was sicker than I was for about an hour. By the time the coffee was made I was feeling a little better, and after sipping a little hot coffee I revived as if by magic, and began to get hungry; then we went to cooking meat and eating, and by the time we were through we were as good as new, and suffered no ill effects afterward. I have been tired many times since, but always console myself by thinking that I am not as tired as I was the time I packed the elk meat over Old Baldy. Like many other of past experiences, I would not like to repeat it, but would be loath to allow it to pass from my mind.

Emerson Carney.

Morgantown, W. Va.

Taking the Boy.

It certainly has been pleasant for the writer to describe in an imaginary way the taking of his boy hunting, one of the pleasures of anticipation put on paper, but while it gave pleasure to the writer and perhaps afforded a few moments' enjoyment to the readers of Forest and Stream who also have boys, yet it, is a matter of fact, gave little or no actual practical enjoyment to the boy in interest.

He, weeks ago, picked up my copy of Forest and Stream, and therein read the imaginary sketch of his shooting trip, made up out of whole paper and lead pencil. I furtively watched his face as he read it, and certainly was paid for my work in the varying and interesting facial exhibitions of interest as he worked along from paragraph to paragraph. And when he laid down his paper he looked up to me and simply remarked: "When will you take me?" I gave him no definite reply other than, "Sometime when I get time," which, when you come to figure it out, is as near to "never" as the word itself.

But his birthday was coming around, and I proposed to take the first step by giving him a gun. A boy with a gun is synonymous with "danger," and I figured that it was best that the danger be reduced just half by getting him a single barrel and not a double gun.

I got him the best single, breechloading, ejector gun in the market (made by ——), a gun that would have rendered me speechless with joy had I received such on my 13th birthday, instead of the muzzleloading percussion cap proposition that I started with. That gun and boy went the rounds of the neighborhood, and it was a hard struggle to have him quit oiling that gun and squinting through the barrel for specks and leading and go to bed.

And when that gun passed into his hands I began to study the calendar closely for a Saturday that could be given over to him. While I fixed the day, yet bearing in mind that man proposes, but the Lord disposes, I began to figure how not to disappoint the boy in case I fell down. So I took Mr. Fullerton into my confidence and we fixed up the trip, Mr. Fullerton to chaperon the boy in case I could not go. With plenty of other things to do, yet Mr. Fullerton gladly consented to aid in helping the young idea how to shoot.

The next thing was to rig out the boy. His football shoes settled the footwear question. Then a pair of canvas leggings to protect his stockings from the briers. A pair of corduroys that years ago had encased my nether limbs, when I weighed less than I do now, were ripped apart, recut and made into an ideal pair of knickerbockers for the little fellow by his mother.

His football sweater was warm and light, and that settled the hunting shirt problem. Then came a canvas hunting coat, fortunately picked up at the gun store, which fitted him comfortably and loosely. A corduroy hunting cap completed his outfit. The boy was practically and sensibly equipped. A friend wrote me only a few days ago to "train up your boy in the way he should go, so that when the dogs see him armed and equipped for the field they may not feel tired and go off somewhere and lie down, as I am told dogs have done before now."

It took some days to do all this, but finally the grip began to bulge as one piece of togging after another was stuffed in.

It was hard for that boy to keep other things out of his mind during school hours, but he managed to so do. At last Friday morning came, and at the first signs of dawn I heard coming from a vacant lot across the street the call of a lone strayed quail, Cohee!Cohee! He had roosted under the weeds during the night, and at the first signs of day began to hunt his mates. I was awake before the quail called, and at the first note jumped out of bed, ran across the hall to the boy's

room, and lifting him out of bed carried him to my room and into my bed and bade him wake up and listen to the calling quail, Cohee! Cohee!

His mother waking, asked what all this fuss was about, and remarked what a shame it was to awaken that boy. But my only reply was that it was a part of the boy's education as a hunter.

The evening train took us south to Norwood, and at midway between eight and nine o'clock we reached our destination. Little time was lost getting located at the hotel and getting the boy into his bed. Admonishing him to snuggle down into the bed clothes and go speedily to sleep I left him and joined Mr. Fullerton in arranging for the team, etc., for the morning.

Mr. Fullerton had brought his meat dog with him, unexcelled on chickens, but, because of his tremendous ranging powers, dubious on quail. We counted upon a pair of unexceptional quail dogs, but they were elsewhere when we arrived, and we made shift by getting a dog here and another one there. And finishing all details by a little after ten, we went to bed, leaving a call for six in the morning. And when I opened the room door I was greeted with "Hello, pa, is that you?" which I met with, "I thought I told you to go to sleep." And if I remember rightly, twice that boy jammed me in the ribs during the night and told me to quit snoring, and when the freight went through the town at four he was awake and remarked that he had heard three other trains go by during the night. There was no need of the Swede watchman informing us that "It was six o'clock already yet," as he thumped on our door. We knew that better than he did.

In no time that boy was rigged for the fray and was about to fill his pockets with shells from the case before he went in to breakfast, so as to be all in shape.

We were at last in our rig, the lunch box, water and coffee jugs being stored away under the rear seat. Mr. Fullerton and myself took the rear seat, and Harold and the driver sat in front. We took in the quail dogs, but the meat dog was left to follow the wagon with a view of steadying him down a bit.

Away we went past farm after farm, until we neared the brush and woody farming district, where wheat and corn fields interlarded strips of woodland and brush lots.

Getting out we entered a wood. The hard rain of the night before had wet everything down, and we realized that our shooting would be circumscribed mainly to snap shots as the birds first got up—and it so turned out.

The first bevy got up wild and went sailing out of the woods across a plowed field to another strip of woods. Mr. Fullerton and I warmed our gun barrels on them—that's all. We began to work out through the tangle of brush and brier toward the open, when just ahead of Harold a quail flushed, going straight away. Harold was between us, and we watched him bring his gun to shoulder, aim and pull. There was a cloud of feathers, and Mr. Fullerton yelled at the top of his lungs, "Got him, by thunder! Good shot! His first shot and his first quail." Harold walked forward and picked up his bird. He had never handled a quail before. He studied it all over, and smoothing down the feathers, put it snugly into his coat pocket. He certainly was a pleased boy.

We worked the edge of the woods, and on turning a corner with Harold by my side, another quail broke cover and sailed away in the open. In cocking his gun and getting it to his shoulder the time was going and so was the quail. I was covering him with my gun, and when I thought him too far for the boy to reach, I pulled—and shot behind him; I moved my left barrel up a peg or two and pulled again, Harold shooting at the same time. The quail dropped. I claim Harold killed him and he claims I killed him, and there the matter rests.

It was proving a poor day for quail. Where they went I know not. When they broke and pitched, the dogs and no amount of kicking could dislodge them out of their wet cover. They seemed to shoot into some place like a bullet and disappear. It was exasperating. Finally, in a meadow was a small brush patch, and here the dogs pointed a bevy. We walked up close and could see the birds scurrying here and there through the leaves. Finally they got up and were off. Harold, I am afraid, tried to kill the whole flock in mid air, and got none, Mr. Fullerton and myself getting one each. We marked them down as best we could, but saw them no more. We quit for lunch. Harold began to look like a veteran, his leggings deep in black mud and his face showing contact with the briers. We built a fire, boiled our coffee a second time, and ate our noonday lunch with a relish—inwardly bewailing the fact that things were wet and that the quail would not run.

But we were again in the rig and away to fresh fields. Up went a Wilson snipe from a pond close by the road, only to fly a few yards and again alight. Harold and Mr. Fullerton walked it up—and as it zig-zagged away Harold fired and Mr. Fullerton right after him—so closely that it appeared like one report—and the snipe fell. It is yet a question who killed that snipe, because Mr. Fullerton asserts that the bird was already falling as he pressed the trigger. And soon darkness set in and we turned the team toward home with a snipe and six quail in the wagon box. The boy blamed himself for his bad shooting, etc., etc.

We reached the hotel and found more boys down for a Sunday shoot. We having had such poor luck also decided to stay over, and we all went to bed hoping for a clear, sunny day on the morrow, and felt sure of such a day because the weatherman so predicted.

The boy was soon under the covers and sound asleep. At six the next morning the Swede made the rounds like the crier of old, and remarked for the benefit of the whole house that "It had been raining already yet since four o'clock." I found that out at four in the morning myself, when I arose to shut the window and then listened two hours to the rain as it came down in sheets and all but blew in the glass.

But the boy slept on, and only awoke when the crier passed down the hall. At first he spoke derisively of the hunter who could not "stand a little rain," but as he listened to the pelting storm he agreed that his home was the best place on such a day, and we ate our breakfast, made our belongings snug and took the train for home. We made the boy march ahead of us going through the depot carrying the bunch of birds, and we disclaimed any proprietorship, gladly giving him all the credit.

But Mr. Fullerton insists that we will yet have another go at the quail and perhaps at the ducks, too. He and the boy have entered into some bond that means further quest for game whether I go or not, and I can only agree with the boy that he is lucky to have such a friend as Mr. Fullerton, who already has done so much to m[illegible] Minnesota what it is to-day in the way of a fish and game State.

CHARLES CRISTADORO.

Carrying Game Through New Jersey

NEW YORK, Nov. 8.—*Editor Forest and Stream:* During a recent hunting trip through Orange county, some discussion arose regarding our homecoming, which would necessitate our traveling through the State of New Jersey. Our game consisted of rabbits, squirrels, quail and partridge, and it was up to us to get these home some way or other. One of our party spoke of an amendment made in New Jersey's laws prohibiting residents of New York bringing game exposed through New Jersey, during the closed season. There seems to be quite a great deal of uncertainty regarding these points. R. T.

[The New Jersey law on this point, as given in *Game Laws in Brief*, reads as follows:

Sec. 26. It shall be unlawful to remove or to attempt to remove from this State any quail, ruffed grouse, pinnated grouse, woodcock, hare, squirrel, English pheasant or ring-necked pheasant: Provided, however, That this section shall not apply to common carriers carrying from beyond the confines of this State in unbroken packages to some point beyond the confines of this State such quail, ruffed grouse, pinnated grouse, woodcock, hare, squirrel or pheasant; any person guilty of any violation of this section shall be liable to a penalty of $20 for every quail, ruffed grouse, pinnated grouse, woodcock, hare, squirrel or pheasant removed or sought to be removed: Provided, however, That this section shall not apply to English or ring-necked pheasants killed on preserves at present established.

The New Jersey authorities construe this as applicable to game brought into the State for transportation through it and out of the State again, even when the game is carried by sportsmen passing from New York State to New York State. An exception is made in favor of common carriers, that is to say, railroads, express companies, etc. Hence, if the game taken in Orange county, N. Y., be turned over to the express company for transportation to and delivery in New York, it will pass through New Jersey without molestation.

But the New York law provides with respect to the shipment of game:

Sec. 29. Woodcock, grouse and quail shall not be transported within this State or into the State from a point without the State less than twenty-five miles from the State line, unless accompanied by the actual owner thereof, and no person shall transport or accompany more than thirty-six grouse or thirty-six woodcock in any calendar year, or more than twelve of either kind at one time. No common carrier or person in its employ shall transport such birds as owner.

This means that the game must be carried by the express company on the same train that the owner of the game travels on; *i. e.*, must be "accompanied by the actual owner thereof."

There is also a provision in the New York law which forbids the export of game from the State; but this is held not to apply to game which is exported from one part of the State to be received in another part, as in this case of export from Orange county through New Jersey into New York again.]

Some Sportsmen's Letters.

Mr. W. B. Mershon, of Saginaw, Mich., writes:

I inclose a letter from Mr. William Held. He is a naturalist sportsman, and he is as fond of flowers as he is of birds, and we enjoy swapping experiences on both subjects. A year ago, Held promised to take me woodcock shooting, for I have not had time for a good many years to look up the woodcock country, so I am entirely out of it. But from his letter, it seems we will have to wait another year. We have had so much rain in this part of the country that it is impossible to get into the covers now, and I think the young broods were about exterminated in June—that is, the quail and ruffed grouse. No one reports very good luck, though I stole away for a few hours Saturday and got three ruffed grouse and a pair of good wet, blistered feet, for I wore rubber boots and I never could tramp in them.

Mr. Held writes to Mr. Mershon:

I am sorry to say that there will be no woodcock shooting this fall around here. I believe the birds passed through during the two weeks before the season opened, Oct. 20. I was out on opening day and bagged five woodcock, and I could see that the grounds were exhausted and finished for the season. The last two seasons were exceptionally late, which made good shooting after Oct. 20. The continuous rain during the past summer and early fall rushed the grounds through earlier than usual. The same cause applies to the snipe grounds. This is the poorest season for snipe I have ever seen, and all on account of the grounds not being in condition when the birds are moving on their southern flight. The little sora, or rice bird, was also scarce on opening day, Oct. 1. The evening before I must have flushed at least 200 in going with a boat half a mile. They all went south with the storm that came up shortly after dark. Quail and partridge also seem to be very scarce around here, I think owing to the extreme wet weather during the breeding season.

I see that some of the FOREST AND STREAM writers are advocating a five-year close season on woodcock. One of them says they are so easily found. I can't agree with him there, as I think they are the most difficult of all game birds to keep track of. I think there are very few killed in the North in comparison with the numbers which are slaughtered in the South. The woodcock is far from extinction, owing to its migrating at night and changeable habits. Once in a while a fellow will write that he has hunted some old woodcock cover a whole season and never found a bird. We have the same thing here. I know a number of places that used to be good covers for woodcock, and they have not contained a bird in three or four years; but that does not show that the bird is becoming extinct, because there are other places not far from the old ones, which have formed within the past few years and contain numbers of birds every fall.

I saw a passenger pigeon last week near the Cass River. It was with a little bunch of mourning doves, and it is the second one I have ever seen.

I hope next season will be a better one for woodcock, so that I may take you along and let you familiarize yourself with this strange bird.

WM. C. HELD.

Here are some paragraphs in the letter of one sportsman to another, so full of good sense and suggestion that we have asked permission to put them into print:

"You have been writing about what a grand thing it is to take the boy fishing or teach the youngster to shoot, and I could plainly see the way the little fellow acted; there had been a complete famine of handling a gun or squinting at a bird. Teach the young idea how to shoot, and not only that, but give him a chance to remember his first shooting trip and many other shooting trips when his father went along as a guide and teacher.

"I know I can look back with the greatest amount of satisfaction to the first time my father took me in his duck boat to let me see him shoot ducks. I can remember when my uncle took me out in the morning to a pigeon flight and let me bang away at a flying bird with my 16-gauge muzzleloader, and how large the lone pigeon was which I promptly lugged home to my mother; it looked bigger than a turkey. I remember how, when there was no one else to go with me, my mother and grandmother used to go and take their knitting and sit on a log and watch me shoot tip-ups and plover off from the salt flats at the outskirts of the town. They were there to see I did not shoot myself, I suppose, and we all felt better satisfied for having been together. I know of the old drives through the woods near the town (for the woods did come near the town then), when mother went along to hold the horse while father and I and the old dog got out to shoot the partridges we could always find nearby.

"Now I think the storing up of such treasures of memory as these in the minds of your boy is a vast sight better than eternally grinding in and thinking you cannot get away from business for even a day."

A NEW JERSEY correspondent, who tells us that he has found much satisfaction in reading the occasional extracts from personal letters printed in these columns, sends us these paragraphs from a sportsman friend, who writes from Chenango county, New York:

I killed six woodcock in Virginia July 1. We had heavy rains just before the first that scattered the cock or we would have done better, as my friend had five broods located. Quail are also very numerous in this section. I have a brood or two on my place. Got some fine work the other day from Gay, Ned and Lady on quail in the meadow by the river. Dogs do nobly.

You are mistaken about it being a poor hatching season for grouse. It was very dry here until June 1, when the rains commenced. The young grouse were then old enough to take care of themselves. From reports the grouse crop is unusually good, which tallies with what I observed July 1. The woodcock crop is better than known for years, and if we get no more long rainstorms, cover will be right for finding them. Swamps are down and in good shape now. I hope you will come up for at least a week. Divide your vacation up. The shooting is assuredly of a higher class than the New Jersey quail shooting. On looking over records I find we killed in 1899 42 birds; in 1900, 38 birds, and in 1901, 25 birds. A pretty good record for these days. Still, in case you come up for the annual shoot next month, I am hoping and expecting to set a new mark. Conditions are favorable for the birds and the weather is great for walking.

Fishing has been good in the rivers. Have been out twice, and took thirty-two bass the first day, from three-quarters to one and a half pounds. My second trip was up the Chenango with D. We made a kill of fifty-two bass and pike. I took a three-pound bass and he a three-pound pickerel. My bass was hooked and killed in swift shoal water. You must let me tell you about it, if we are let to meet again.

It is very doubtful about my getting to New Jersey for the quail this fall. We shall go to Florida rather earlier than usual, and I have a certain number of grouse, quail and woodcock that require my attention. My efforts in New Jersey have been more or less of a failure of late. I would like, beyond anything else, to have some of the good old days with you again, which seem to have gradually got out of our reach. Hump yourself and arrange for the hunt.

Some Game Won and What it Weighed.

NEW YORK, Nov. 4.—*Editor Forest and Stream:* Hunting in Connecticut on three days last week, my guide and I secured two rabbits, six ruffed grouse, twenty quail and eighteen woodcock.

Rabbits, squirrels and grouse were plentiful, but we did not care to kill rabbits and squirrels, and the cover was so dense that successful grouse shooting was exceedingly difficult.

I have photographs taken of the "string," and if I get the time to spare, may give you some details of the trip. On this trip I killed my first woodcock and grouse, while my first quail was bagged on Long Island last December, and described in one of January's numbers, making this my second crack at the quail.

The weight of some of these birds were as follows: 4 woodcock, 8 ounces each; 2 woodcock, 7½ ounces each; 10 woodcock, 7 ounces each, 2 woodcock, 6 ounces each; 2 grouse, 1½ pounds each; 2 grouse, 1 pound 6 ounces; 2 grouse, 1¼ pounds each; 4 quail weighed 8 ounces each, and the other birds were unweighed.

The weather was delightful, the sport fine and my enjoyment unbounded. W. H. E.

Man with the gloomy liver,
Cease to deplore thy fate;
Get out toward the river
And go to—digging bait!
—Atlanta Constitution.

Michigan Brush and Marsh.

HARTFORD, Mich., Nov. 8.—*Editor Forest and Stream:* The quail season opened here with a fair showing of birds, but a great many are undersized. Your correspondent got eight the first day. But few birds have been killed. There are few trained dogs in this vicinity. I wish to tell you of my experience in killing a ruffed grouse the other day; it was marvelous. Grouse are very scarce in this locality, therefore when we get one we consider it a prize. While I was out shooting quail, a startled grouse flew almost through my hair; not having time to shoot until it had passed me, I turned, but could not shoot until it was out of range. Soon after I shot I heard another gun, which shot from the same direction I saw the bird fly, and followed my shot so closely I knew it was meant for the same bird. Going over the crest of the hill where I had heard the gun, I found it was a lady huntress, Mrs. Nina Moore, of Hartford. She said she had shot at the grouse and missed it. She said it flew so close to her she could have clubbed it with her gun and might have killed it that way. She pointed out to me where the bird had gone down in the brush, some forty rods distant, and I started, determined, if possible, to flush the grouse. Not having my dog with me, I knew it was a matter of chance, as when they have flown so far the birds will lie very close. When I arrived as near as I could calculate to the place where the bird lit, I found the brush very thick and plenty of logs, but grasping my gun with a firm hand, I started into the brush, hoping to flush the bird, and if flushed, to shoot, hit or miss. As good luck would have it, I had not taken five steps into the brush, before whirr went the grouse from almost under my feet. A shot rang out instantly, and that grouse lay fluttering in the grass without any head. That is what I call first-class luck. I do not remember ever killing a bird, of which the thug of the fall gave me more pleasure than did the fall of that grouse. And I instantly thought of the controversy going on in FOREST AND STREAM as to what constitutes sport. I know that the writers are friendly, and I think each one believes what he advocates, but I have killed many a wild turkey and many a deer that dressed 250 pounds, and I know that the pleasure of killing that grouse was as great as it would have been had it been a 200-pound deer. So I thought of the poet's comments on the "Difference in Opinion";

"Do not mock your neighbor's weakness when his random whims you see,
For perhaps he something like it every day beholds in thee.
Every mortal has his hobby. It may foolish seem to you,
But remember, bright or simple, you have got your hobby, too."

So, with these friendly writers for the FOREST AND STREAM, both are right, and I love to read the discussion.

It may interest the readers of your paper to know what the duck shooting is in some parts of Michigan. Harry Soule, of Syracuse, N. Y., is the Nestor of the Monroe Shooting Club; he is seventy-three years old, and every season finds him on hand ready for the hunting season to open. Yesterday he was feeling particularly frisky, and he started out to break the single-gun record, and he did it without turning a hair. When he returned to the club house after his day's shooting, he carried with him ninety-eight ducks, eighty-two of which were canvasbacks. Ducks were never known to be so plentiful on the club's preserves as they are this season, but the pot-hunter had better keep at a safe distance, as the marsh is guarded at all points. More than 300 ducks have been killed by the members of the club this week. This report is just one week late.

'Coon are very plentful. Ernest Tyler caught a 'coon on the Paw Paw River the night before last which weighed twenty-eight pounds. SULLIVAN COOK.

Woodcock and Wood Duck.

OTTAWA, Canada.—*Editor Forest and Stream:* Sportsmen worthy of the name are lamenting the vanishing of the woodcock and the wood duck, not only in the United States, but in Canada. The woodcock is to be found in eastern Manitoba, along both sides of the Great Lakes and the St. Lawrence, and in the Ottawa Valley—in fact all the way up the St. Lawrence River to the Gaspé Peninsula. In Rensselaer county (New York State), a law has been passed rendering the shooting of woodcock illegal before 1903, and if this creditable example were to be generally followed throughout the region inhabited by the woodcock, there could be no question as to the result. Such action on the part of the Northern States would have the co-operation of Ontario, which has a law empowering it to act with two or more of the States lying to the south of that Province (one of such States being either New York, Pennsylvania or Michigan) in prohibiting for a period all hunting, shooting and sale of any migratory bird that appears to be in danger of extinction. In fact, New York has recently taken steps looking to the establishment of such co-operation as the Ontario Legislature have suggested on this point. Unless sportsmen and others especially interested will take this matter in hand and secure proper legislation for the better protection of the woodcock, future generations will have cause to grieve over the loss of one of the finest game birds that ever graced a covert.

The wood duck is found from Nova Scotia, New Brunswick and Ontario, westward to British Columbia, and southward through the United States to its southern border and Cuba. It is rather uncommon in the eastern Canadian Provinces, but in parts of Manitoba and British Columbia it is abundant. In the Saskatchewan region it has been found as far north as latitude 54, and on the west shore of Hudson Bay as high as latitude 60, but it is rare north of the fiftieth parallel. Happily, to their credit be it stated, the three Canadian Provinces of Manitoba, Ontario and New Brunswick, and seven States of the Union (New Hampshire, Vermont, Michigan, Wisconsin, Minnesota, Utah and California), by closing the season before Feb. 1, have abolished the spring shooting of wood duck within their borders. It is regrettable that such States as Iowa, the Dakotas, Montana, Wyoming and Colorado, which contain large breeding grounds, should be among the number that extend the open season to April or later. Birds are more easily and more completely destroyed on the breeding grounds than on areas which they merely pass over during migration; for when the breeding season arrives and the nesting site is chosen, birds become less shy and more inclined to remain in the neighborhood, so that gunners (the term "sportsman" cannot be used in this connection), while in search for late migrants, have little difficulty in killing all the wood ducks that are to be found. Sportsmen willing to deny themselves a little present sport for the sake of future gain to themselves and posterity should spare no efforts to save and restore this beautiful bird. If spring shooting were abolished the wood duck would gradually return to its old haunts, and by degrees re-establish itself, to the joy of all sportsmen and the satisfaction of all lovers of nature. W. H. COARD.

CHICAGO AND THE WEST.

Northern Flight is Down.

CHICAGO, Ill., Nov. 8.—The northern flight of big ducks is at last down along this parallel of latitude, and if we are to have shooting this fall it will be within the coming week. Indeed, we have already had shooting, good shooting, and lots of it, for the last week. The reports from the Kankakee country near Water Valley, Shelby, etc., say that the sport there early in the present week was as good as has been known there for twenty years. This flurry of shooting came in unexpectedly and very quickly, and was no doubt attributable to the change of the weather from fair to rainy and stormy. The last two days were bright, and it is hardly to be supposed that the duck shooters who went out the middle of the week have had any very heavy shooting. Those who went down Sunday and Monday last were the lucky ones. Eddie Bingham and Frank Bissell were down to Water Valley on a sort of loafing trip and didn't get out until after 11 o'clock, but between them picked up over fifty ducks. Tom McCoy, of Rensselaer, Ind., with his pusher, killed ninety-six birds one day, most of them big ducks, this latter being the heaviest fall bag of ducks of which I have heard in many years in this region. It is sometimes, though rarely, equalled by the spring shooters on the first north-bound flight, when the birds are thin and very hungry. Other shooters from Indiana and from this State who were in along the Kankakee the first three days of the week, are stated to have had excellent sport. Upon the contrary, the Tolleston marsh, located further to the north, just across the Indiana line, did not furnish so heavy shooting as the Kankakee country below it. For some reason or other the Tolleston birds seemed to move out and drop down further toward the south. This well-stocked and well-fed marsh, however, is by no means abandoned, and nearly all of the duck shooting club members are now present upon the grounds. Mr. C. S. Dennis and one or two friends left yesterday and a great many others are going down to-day. Mr. Hempstead Washburne is another one of the Chicago membership to try the Tolleston marsh at this time.

Mr. W. L. Wells and his friend, Mr. Robert Stites, of this city, have been trying all week to determine upon some shooting country where they might be fairly well assured of some ducks. They made it up to go to the Upper Meredosia marsh on the Mississippi River, below Clinton, Ia., but yesterday morning Mr. Wells got a report from Mr. Jenks, of Clinton, to the effect that the weather had come off fair and that no ducks were in along the river. This unsettled them very much, and they determined to go to Fox Lake, Ill., starting to-morrow night, there having come report that considerable numbers of birds were working in that country, with the likelihood that greater numbers would come in any day. Now came up the reports of these heavy Indiana bags, and a half-hour ago I saw Mr. Stites and Mr. Wells chasing down the street getting ready to go to Thayer, on the Kankakee River, for their trip, which will be of two or three days' duration.

Mr. Eddie Pope, of this city, has been passing four days at New Boston, on the Mississippi River, but no reports have come up from him in regard to his success. It is believed that he got there just ahead of the heavy shooting, and that the fair weather probably killed his sport.

Mr. Henry Ehlers, an old-time member of the Diana Club, of the Kankakee country, started for the club ground in a big hurry yesterday. It is believed that good shooting will be had there within the next few days.

Meantime, a cold wave which reached twenty below zero at Medicine Hat, in the Northwest, is reported to be making its way eastward. This will assuredly send all the birds down out of the northern country, and, granted any fairly cloudy and rough weather here in the next few days, should assure the wildfowlers their best opportunity of sport in the current season.

Charges Refuted by Actions.

The unfounded attack of a Chicago paper upon the State game warden and deputies of the State of Minnesota received the best sort of refutation during this week. Warden Fullerton and his hustling assistants began a campaign against the hotels and cafés of the cities of St. Paul and Minneapolis. They raided the Niccolet Hotel, of Minneapolis; Cromby's Restaurant, and Barge's Restaurant, as well as Carling's Restaurant, in St. Paul, bringing suits in each of the instances above mentioned and taking out warrants for the arrest of the proprietors of the different places. It is not of record that the State game warden of Minnesota asked the advice or consent of the paper in question in thus carrying out his customary warfare against illegal game sellers, but the fact that he has gone after the very people who were reported to be his friends and allies in crime, would seem to be full answer to the malicious misstatements.

Lost in the Rockies.

On last Tuesday, Nov. 4, Supt. E. F. Egan, of the Great Northern Railroad, who was with a private car party of hunters at Belton, Mont., disappeared from his friends, and at this writing has not been discovered. The other members of the party are at the car waiting for his return. No word has been received from him as to his whereabout, and considerable alarm has been felt by his friends. President James J. Hill, of the Great Northern Railroad, has directed that 100 men be sent out to hunt for Mr. Egan, and Mr. Egan's brother has gone on from Chicago to join in the search.

The Quail Season Opens.

CHICAGO, Ill., Nov. 1.—The quail season for Illinois opens to-day, but it is not attracting very much attention, for the reason that our quail shooters are obliged to go almost as far for good shooting as the duck hunters, and they prefer to wait until they can make a good and probably successful hunt of it. It is still too early for the best of the sport, for in this phenomenally mild fall we have had no frosts as yet, and the vegetation is unusually high on account of the heavy rains of the summer. It is mild and bright, better chicken weather as we commonly find it than quail weather. Perhaps any day may bring a change, with more of the orthodox fall tang to it, and then we shall see the hunters going out in greater numbers. Messrs. F. E. Atherton and R. A. Turrtle started to-day for Savannah, Ill., west of here, in what is known to be good quail country, and a few shooters start south this afternoon, but nothing much is doing yet.

It is the belief of the experts that there will be a good crop of quail south of the wet belt in this State; that is to say, as far south as St. Louis. Below that line there is likelihood of abundance of birds. The Illinois Central Railway people say they have birds all along the line below the Kankakee River. Some men to-day left for Farina, on that line, and expect to find birds from what stories they have heard. Thence south to Cairo there should be shooting.

My old-time shooting friend, Warren Powel, down in Christian county, suggests that we get after the birds before very long, and wants to scare up some sort of shoot for a day or so next week, and then make a trip further south toward the Ohio River later in the month.

Chicago shooters ought not to overlook the attractions of Minnesota this fall, as a quail State. Any shooter who took out his license for chickens last summer might do much worse than use it again on quail. Minnesota would have the additional charm of a good chance to get some fine ruffed grouse shooting, to say nothing of a duck shoot in the bargain. The prairies of the Northwest in the fall can not be beaten for keen sporting flavor. Warm weather is nice, but the Southern shooters always like a taste of the air of the frosty Northwest when they get the chance. The truth is, however, we all want what we haven't got. As for sport, to my own mind, quail shooting is about the best of all, in the days when the leaves are red and brown, and the stubbles are gray, and the cornfields a thousand shades of yellow and gold, and the persimmon hangs high but ready to let go.

Deer.

Now also is the deer season with us, a season with the warmth of autumn in it, and no touch of snow for tracking, which means many disconsolate days for the still-hunters. The railroads are making their customary campaigns in Ohio and Indiana, and will carry the usual train loads of deer hunters up into the woods—more than they will carry back again. The custom of wearing highly colored clothing while engaged in deer hunting is coming into more and more general use. The proper "deer stalker" now is a bright red cap, with coat to match, either bright red or blue. Even so there will be plenty of men mistaken for deer and shot by their friends. There was never any very great excitement over the deer season here in Chicago, for some reason, the greatest numbers of the Wisconsin and Michigan shooters coming from other points than Chicago. Mr. Byron Veatch, with a few friends, is preparing for a deer hunting trip in the Fifield country of Wisconsin, and he says they have reports which state deer are very abundant indeed at present in that section. They expect to have no trouble in getting their limit.

Ducks.

A few ducks are in on the better known marshes about this city, but the weather is at this writing too warm and clear to offer any special sport at them. A few of our shooters go up to Fox Lake to-day, more for the sake of getting out of doors than with any expectation of sport. There are a few birds in there, and among these a little flight of jacksnipe, not enough to afford much excitement. The main item in a Fox Lake bag these days is the mudhen, and indeed this bird furnishes more than three-fifths of the number of shots fired by a duck shooter in this part of the world to-day. Ten years ago one would have been laughed to scorn for taking one of these fowl home with him, but now it seems the case that many shooters, no matter how shame-faced they may be about it, rather figure on this bird to offer a bit of shooting, and a great many mudhens are now taken home, whereas formerly they were not shot, or were left to rot where they fell. I regret to say that there are some shooters so brutal as to kill mudhens and leave them lying where they are shot. I have heard of one party who killed over a hundred mudhens in this way, making no use whatever of them. This is not right. It would not be right even if the bird was quite unfit to eat. Some of my friends say that it can be eaten and is not wholly unpalatable. Eat it, and like it, or don't shoot it.

I hear that one of the Muercke boys of Nippersink killed 187 mudhens a week or so ago, but understand that he used them at his hotel table. The battue on mudhens is now part of the sport offered on the Fox Lake Chain. A big raft of the birds is located and driven into a bay, and then the boats close in on them, and get the shooting as the birds rise and fly back toward the open water behind the fleet of boats. Sportsmen tell me that of a morning the bombarding of the mudhens is as heavy as the firing used to be in the days of actual duck shooting. The newly come duck shooter is apt to be deceived by it, and to think that a duck flight is really in. The latter is not apt to happen on Fox Lake in these degenerate days.

Got Foolish.

To-day I got foolish. I was passing a window of a department store, and saw some old weapons, all of patterns once used and approved in the Army of the United States. I could never resist such things. I added to my collection of what a Certain Person calls "junk" a couple of bayonets at 15 cents each, a fine officer's sword at one

dollar, a pair of sword bayonets at fifty cents, a cavalry saber at six bits, a Sharps carbine at two dollars and a half, and a Springfield rifle, the same sort I used to tote in the National Guard, for the same price as the carbine. There'll be trouble in my family when that stuff is delivered; but how could I help it? It was too bad to see these splendid things in such a place, Beside, I have a theory that every American man ought to preserve all the weapons of his own family, and if possible should keep at least a fair assortment of the weapons of his country, and he ought to know how to use all the latter as they come along. I forgot to say that I got a pair of genuine old Colt's navy revolvers, wooden butts, such as used to be correct in Western full dress up to times within my own memory. They were both worn and disfigured, but the locks were beautifully smooth and even. There was a box full of them, and it was a shame. I was much of a mind to buy the whole outfit. Every one of these weapons was in just as useful condition as ever it was, and it made one feel a bit odd to see such excellent arms now so wholly without value. The Springfield breech block in limbo, and the grand Sharps' action out of use! How strange that seems to even young men! I'm going to keep these things for the sake of auld lang syne.

With Uncle Adam.

This from Mr. M. F. Westover, who has been in New Brunswick and is going back again. I wish I could go back, too, to kill the rest of my moose. It was about this time last year that plans were making for my own trip to the moose country, and the trip which was so pleasantly unsuccessful, as I presume one may best call it, since I did not get all of my bull. Mr. Westover writes:

"I have greatly enjoyed your account of your trip with Adam Moore, and perhaps I am better able to appreciate it, since I was at the same time down on Cain's River doing some hard snowshoeing. I got in one night after twelve hours' work during a snow, which turned to rain in the afternoon, with not a dry thread upon me, chiefly because of the loads of snow and water the spruces dumped upon me. When I came through Fredericton Mr. W. T. Chestnut told me you were up in the woods. I shall start in day after to-morrow for a fortnight with Adam. Shall arrive at Plaster Rock on Friday evening, drive through to the Forks that night, and walk in to the lake from there."

Happy man, and good luck to him!

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

Be Sure and Be Safe.

Editor Forest and Stream:

I have read in the American papers this season reports of several sad accidents, similar to many which have occurred during the last few years, due to hunters shooting men in mistake for deer. They seem to me to be attributable to two causes:

1. Occasionally to the use of small-bore military rifles, modified for sporting purposes, the projectiles of which have such an enormous range and penetration, that people have been struck by them without hearing a sound, or knowing whence they came.

2. Generally to the shocking practice (of which even some old hunters have been guilty) of firing at an object not distinctly seen, or, worse still, at a bunch of moving leaves.

It is to be hoped that the first-mentioned cause will soon be removed by the increasing use of the older pattern rifles of the Winchester and Marlin companies, the cartridges of which are now loaded with smokeless powders and metal jacketed, soft-pointed bullets, larger of caliber and shorter in proportion to diameter than those of military weapons.

Firing at moving leaves, or at anything not distinctly seen, appears to me to be really criminal, because the man who does so is well aware that the object he aims at may possibly be a human being. Even if he feel sure that it is a quadruped, the act is not that of a fair sportsman, for the chance of killing quickly is not greater than that of letting the animal escape with a broken leg or wound in a non-vital part of the body.

I can truly state that during the whole of my own shooting career I never fired at any animal, large or small, without being able to see enough of him to aim at a vital part. And I never knew one of my sporting friends or acquaintances who acted otherwise. It is a satisfaction to think that, through the observance of this rule, very few animals have been uselessly wounded; but even with this precaution, I, on one occasion, very narrowly escaped killing a human being. While walking through some acacia jungle, I saw what appeared to be a "ravine deer" feeding about seventy yards distant. The whole of the body was visible, but the head, neck and legs were concealed behind some low bushes. I leveled the rifle and was actually pressing the trigger, when a thought suddenly struck me that the color of the skin was not exactly that of a deer. I instantly raised the muzzle, stalked to within about thirty-five yards, and found that I had aimed at a Hindoo village woman who was digging up some kind of roots, her body being bent level. She wore the usual dress, consisting of a large kind of sheet, called sāree, which covers both the head and body. It was dyed with a red color, in common use, and exposure to the sun had turned it to yellowish brown.

As respectable native women dislike talking to strange men, I quietly drew back without letting her see or hear me, so she never knew how nearly she had escaped sudden death. Thirty-four years have passed since then, but even now the thought of how she might have been killed in another fraction of a second, gives me a feeling of horror. The difference in tint between her dress and the coat of a "ravine deer" was so difficult to see at a distance of seventy yards, that I am certain the idea must have been impressed upon me, at the last moment, by some friend in the spirit world.

A colonel in the Indian army with whom I was acquainted (a very fine shot) was in the habit of using an Enfield rifle of .577 bore for large game. One day he fired at an antelope, when the solid conical bullet dropped on to an old mud-built fence, rebounded to a great distance, and passed through the brain of a native. My friend was so shocked on discovering what had happened, that for a long time (I think some years) he gave up the use of the rifle, although an ardent sportsman. When resuming it, he bought a .450 express with hollow-pointed bullets. When one of these strikes the ground it is crushed out of shape and therefore does not travel to a dangerous distance.

The habit of reckless firing seems partly attributable to the use of repeating rifles. In muzzleloading times I resided for six years in New Brunswick and Canada, and never heard of one case where a man was shot in mistake for a deer. A muzzleloader required enough time to reload to make a hunter careful about firing before he knew what he was aiming at. J. J. MEYRICK.

SALTERTON, Devonshire, Eng., Oct. 25.

Chesapeake Bay Ducking.

HAVRE DE GRACE, Nov. 6.—*Editor Forest and Stream:* The ducking season on the Susquehanna Flats opened on Monday, the 3d inst., and cannot be said to have been successful. The throng of gunners who appeared on the ducking ground was larger than ever before known hereabouts, but a heavy fog which lay over the water prevented them from doing anything for the first half of the day.

Beside the local sportsmen, who turned out in great force, there were present many men from New York, Philadelphia, Baltimore, and other lesser cities.

The fog lifted about noon, and then the shooting began. Long before that, some of the gunners had become discouraged and given up; they returned to the shore, but the greater number waited with patience, thinking that the fog would lift and it would be possible to see. There was no question as to the abundance of the ducks, and the shooting would undoubtedly have been great if the weather had not been adverse.

Beside the gunners, the ducking police were on the ground, watching the various craft, in order to see that the law governing the time of starting out and crossing the line was observed. Their enthusiasm led a considerable number to cross the line before 5 A. M., and the police made seventeen arrests for this offense.

After the fog had lifted, the birds began to fly, and there was good shooting. While the number of birds killed does not compare with many opening days of the past, yet some very good bags were made—one of 148 birds and one of 147.

So far as can be learned at present, the number of ducks here is very large, but just how the shooting season may turn out depends on so many conditions that a prediction concerning it would not be safe.

There have been issued more than one hundred sink box and sneak boat licenses; a number which one would suppose would pretty well crowd the bay, but there is plenty of room here for these and for others.

The prices paid for ducks by dealers are, for canvasbacks, $3 a pair; redheads, $1.25; ruddy ducks, 80 cents, and blackheads, 50 cents. SINK BOX.

The Iowa Game Season.

HUMBOLDT, Ia., Oct. 31.—Duck hunting in Iowa this year, especially in the northern part, has been the best in many years. Ever since the season opened on the first of September fine sport has been had. On account of the warm fall the ducks are slow in arriving, but when they do come down there will be the biggest flight ever seen in Iowa for several seasons.

The first of this week was a slight cold spell, which brought a few ducks down and with the ducks already here, great sport was had, but the warm weather has again come back and rain is now falling.

The northern prairie chickens are down now from Minnesota and other neighboring States in great numbers. Chickens are nearly as numerous as ducks, while only a few weeks ago a hunter who saw a bird in this country was regarded as looking upon quite a rare sight.

In the evening and early morning, if one finds himself in the country, he will be greatly surprised at the immense numbers of chickens he sees flying. But get in a good fly way and you will be still more surprised, flock after flock, ranging in number from half a dozen to thirty or forty birds, will go over you, and if you are a good shot you can get a good number of birds. It is difficult to get at them unless you get in their fly way, for they are way up in the air and going at a pretty good rate.

GEORGE J. BICKNELL.

Heavy Flight of Woodcock.

WEST HAVERSTRAW, N. Y., Nov. 3.—The last week in October has been marked by a heavy flight of woodcock. I have not been out myself, but hear that the birds have been more numerous than for many years. They were found principally in rather high ground along small streams of water and on the plateaus, wherever there was any feeding ground. Fortunately, only a few men knew of the flight in time to take advantage of it, and I cannot hear of many large bags being made. Two men had a large number of birds as the result of two days' shooting. The woodcock were in a large bag, and I have not learned the exact number. Quail shooting began on Labor Day, and the country side was alive with men and boys carrying guns. Wagon loads of dogs were transported here, there and elsewhere, but I doubt if the number of quail killed equalled the number of dogs, guns and men that took the field against them. T. G.

On Long Island.

BAYPORT, L. I., Nov. 10.—The past two weeks have been very good in this neighborhood for sportsmen, and the weather all that could be desired. Over 100 deer were killed in a radius of about four miles from here. They are in very fine condition, but very few bucks are killed in comparison with the does. I was out with the South Side Bohemia Sportsmen's Club on Wednesday at Oakdale, and we got three fine deer. Rabbits are very plentiful this year. Gentlemen out with the various guides, both ducking and quailing, have got very satisfactory bags. Redhead are now in the bay in good number, one gentleman staying here got four in one day.

HENRY STOKES.

New Jersey Ducks.

TRENTON, N. J., Nov. 10.—I returned Saturday eve from a three days' trip to Beach Haven, N. J., for ducks. Walter F. Smith was with me. The flight of ducks reached Tuckerton Bay on Monday. On Tuesday afternoon there were as high as fifty ducks shot from each of several different points. We located on our point about 2 P. M. on Wednesday, and between that time and dark shot forty-nine ducks. On Thursday at the same point we shot fifty-one ducks. On Friday we shot from an island leased by our gunners and got thirty-five ducks. We got sixteen redheads, and the rest were mostly broadbills.

With such a chance for a royal good time right at out doors, and with the excitement of the outing still in my system, I feel that brother duck shooters should be given the opportunity for like enjoyment.

FRED B. YARD.

Canvasbacks on Lake Mendota.

MADISON, Wis., Nov. 4.—Several years ago certain men planted some wild celery in one of our lakes, and this has grown very rapidly, and now covers a number of acres in one of the bays of Lake Mendota. The canvasback have discovered this rich feeding ground, and thousands of them can be seen at any time of the day. It is not unusual in this part of the country to see a hunter returning with a bag of anywhere from twenty to fifty of these fine birds. Of course, they are hard to shoot, but with a due amount of patience, a good shot is well rewarded for the trouble of going after them. I expect to waste my usual amount of ammunition in a futile attempt to bag some of these foxy birds.

FAYETTE DURLIN.

Dr. Davis Gets His Quota.

LANCASTER, Pa.—*Editor Forest and Stream:* I have just returned from a very successful moose hunt in Nova Scotia, under the guidance of the veteran hunter and guide, Mr. J. McKay, of Shelburne, N. S. My hunting mate from many years was Mr. A. C. Kepler, of this city.

S. T. DAVIS.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Fall Fishing in California.

AVALON, Santa Catalina Island, Cal., Nov. 1.—The fishing season is over in the East. Rods, creels and old clothes, fly-books and various articles dear to the angler's heart, are being laid away or hung up in the den, where they regale the eye, and perhaps some old live bait forgotten, regales the senses for weeks to come. How different is all this in California! Here the summer season is still on, though over in theory. Yellowtails are biting well, and November is, all things considered, the best month in the year, as the fish are now gathering to begin their off-shore cruise to the outer banks or down the coast to lower California. At this time the fish are found in large schools at Ship Rock, and every day bands and schools pass the bay of Avalon, affording splendid sport to the wielder of the rod. The yellowtail arrives in February and stays until the first hard storm, or about Dec. 15, so can be had almost the entire year. But by Dec. 1 the season may be said to be closed, and that of winter is on. So far as weather is concerned, no one would know that winter had arrived, as Santa Catalina has a climate about like that of Madeira, only cooler in summer. Winter here means roses in bloom; means a wealth of wild flowers. The Mariposa lily in bloom and the painting of the entire island in a garb of new-born green.

An old-timer told me that he had seen frost here once in six years; this at Avalon on the water, but if any one wishes frost they can find it in the upper island, 1,800 feet above the sea. But the days at this island are perfect, and in time to come it will be famous as a winter resort, and even now, one hundred thousand persons visit it a year, and nearly all of them fish, which conveys an idea of the quantity of fish the place must have to supply the demand.

When the winter angler lands at Avalon he is met by scores of marine hackmen, who hand him cards and cry the names of their boats. There are tuna boats, rowboats, glass-bottom boats, yellowtail boats—in fact, so many different kinds of craft that a man is bewildered. Down at the south end of the little bay are the stands of the boatmen, each of whom has about twenty feet for his headquarters, which consists of a tasty seat, rod box, rack for hanging fish and drying lines, above which is a long sign bearing the name of the boatman and gaffer. He owns the sea rights directly in front, and on a rope in a long string are his dozen or twenty boats, as the case may be. Probably no place in the world is better arranged or more directly designed for the comfort of the angler than Avalon, which is but forty miles from Los Angeles, a city of over 125,000 inhabitants.

The winter fishing here includes some very gamy fish, as the whitefish, which attains a weight of twenty-five pounds; five or six species of rock bass, from two to six pounds, and at San Clemente they range up to twelve pounds; the sheepshead twenty-five pounds; albicore, sixty pounds, and numberous fish, as the blue perch, which afford good sport with light trout or bass rods, including the halibut, a very gamy fish.

People here consider the whitefish the game fish of winter par excellence, and a beautiful creature it is, a dress of light gray, with long dorsal and anal fin tipped with vivid blue, a large head, yellow and white belly and most expressive eyes. I had what might be called the fish of my life with these gamy creatures at the island of San Clemente, twenty miles southwest of Avalon. The launch was anchored off a kelp-lined point, where the tide ran merrily, sometimes one way and sometimes another. The boatman began to "chum," and soon a hundred feet astern we saw a few brightly colored fishes that gradually

drew nearer and nearer. I had a ten of twelve ounce split bamboo, with a trout line, small hook and crayfish for bait, and this I cast well out into them. It had hardly reached a foot below the surface when there came a strike, which I am convinced astonished my rod. The fish made a fine run directly out, taking a hundred feet of my line to the music of the reel, and there was no stopping him—and no one wanted to. Around he rushed, directly at the surface, then turning, to plunge a few feet; then coming to the surface, to run in on me, turning like a bass, and playing a score of delightful tricks, all of which testified to its fine game qualities. If it had been a big lake trout, one might have told the story for weeks, and lived on it, but being only a whitefish, "putting up its regular fight," no one thought anything about it. I landed the fish in about ten minutes, and I forced the fighting in a mean and underhand manner, I confess it, that I might have more, and to pay me, the next whitefish put up a run that broke my line—how or why I know not, but I really felt happy to bring the rod out of that double rush alive. Three of us were fishing in this current, and some one caught a fish every moment, and we fished (tell it not in Gath) until we had enough to supply the yacht and the old herder ashore, and then we brought the fish to net and carefully released them. Commend me to California whitefish, when taken in deep water and a swift current in the flood tide.

We had expressed a wish to catch all kinds of fish, and a few days later came to anchor off a kelp bed near what is known as the fence, directly back of the town of Avalon, on the west coast of Santa Catalina. The boatman pulled in a big bunch of kelp, which served as an anchor, and we cast into open places in the kelp bed, using fairly stiff rods. Strikes came at once, from a fish that demonstrated its qualities by winding up my line in the kelp after a fine run of fifty yards, during which the reel made the music we had hoped to hear. It was cheaper to cut the line than waste time when such fish were biting, and ten minutes later I had a sheepshead on, which gave me as fine a play as any striped bass I remember, and several fifty-pounders have fallen to my gaff. The fish was a "tackle-tester" in every sense, and made so rapid a play that I was breathing hard when I had the fish where I could see it, a most astonishing creature, broad side on, bearing away from me with a force that made everything creak and really buckled my rod, when I finally put on too much strength. Yet I landed the game after a hard struggle, and if the fish had been taken clear of the kelp where I could have played it with freedom, it would take its stand with any of the fine game fishes of America, as it was a continuous and rapid contestant, and never gave up, resourceful and tricky. But the appearance of this game fish! It had a blunt head like an old frigate of 1760, a ram black as jet, yet the under jaw was pure white; the mouth large and filled with sharp teeth, plugs of ivory. The body was banded like a porgy, but the stripes were alternately black and red, giving the entire fish a most striking appearance. I or my boatman had anchored over a convention of sheepshead, as the strikes came so fast and the runs so furious that I could have filled the boat in a short time with these fine fish. I took several rock bass and half a mile up shore, in passing a little beach, we found a school of bass chasing sardines. They were within two or three feet of the beach, and taking a light rod I had my boatman back the boat in, keeping her head to the sea or rollers, and as she rode them well he put me within fifty or sixty feet of the school and I dropped a small smelt into the school, and every time took a fish, some very large, being heavier than the largest black bass I ever saw, and one must have weighed in the neighborhood of ten pounds, was a dark green hue, deep and thick. He made a splendid run and attempted to jump, not usually a trick of this fish, and cut through the waves in a most delightful fashion, and what with his plunges and my efforts to retain my position, dropping flat in the boat when a large wave came; I more than once almost went overboard. It was exciting sport, but murder, as the bass were crazed with excitement, and bit at anything. They make excellent sport, but give up much quicker than a black bass, to which they bear a marked resemblance, hence should be fished for with very light rods and line—trout tackle. In the bays and smooth water the blue perch, medialund, is common, and with an eight-ounce rod and long leader fly-hook and crayfish bait, I had trout fishing in all but name. The fishes run from half a pound to two pounds and were very gamy. All these fish can be had any winter day, pre-supposing the right boatman is had, and nearly all the men here are old-timers, but one, Mexican Joe, well-known by anglers, was born on the island and knows every rock.

The tournament of the Tuna Club this season was a particularly interesting one, though no great records were made. Never in years did the fish bite so well as in the past season. The prize for largest tuna went to Mr. Ernest Ford, of Phœnix, Ariz., a gold tuna button. Second tuna was a tie between F. C. Winter and R. F. Sticking, 150 pounds, prize silver mounted rod. Smallest tuna, Col. John Stearns, Los Angeles, 65 pounds. Col. Stearns was awarded a prize for the first tuna of the season, taken March 11. This was a very unusual catch, four months ahead of the regular season. Prize for the largest black sea bass, silver cup, gold medal, and silver-mounted rod, went to Dr. H. T. Kendall, of Pasadena, who now holds the world's record, 419 pounds. Artemus Ward, Jr., of New York, took the booby in this class (55 pounds), an infant phenomenon. Prize for largest white sea bass, silver-mounted rod, 45 pounds, went to Miss Florence Haas, of San Francisco. For largest yellowtail, 47 pounds, gold medal, silver-mounted rod, Dr. S. H. Trowbridge, Fresno, Cal. Largest albicore, silver-mounted rod, 35½ pounds, E. Fallon, New York city. Largest bonita, 24 pounds, Fred C. New, Denver, Colo., rod. Largest sheepshead, 28 pounds, Col. John Stearns, Los Angeles. Whitefish, 7 pounds, gaff, John E. Stearns. The boatman's prize for first tuna of the season went to Harry Elms. Following this tournament, the boatmen gave one themselves.

DEL REY.

Mrs. Youngwed—"And what are these?" Dealer—"Salt mackerel, mum!" Mrs. Y.—"Are they quite fresh?"—Chicago Daily News.

A Pearl River Camp.—IV.

(Continued from page 378.)

OUR tackle was about the same as that used for bream, except that we now used a larger hook.

The boat was propelled by a small paddle at the stern, used with one hand and kept submerged, and our casts were in toward the bank among the cypress knees and overhanging limbs. Walter had the first strike, taking a white perch of fair size. Will then hooked a fish, but lost it by becoming excited and jerking too hard as he swung it over the boat and out in the lake on the other side the full length of the line when the hook tore out.

Jim considered this so funny that he stood up to laugh, and Will, leaning over to secure a fresh minnow, tipped the boat, and losing his balance, Jim went overboard. The water was quite deep, so all hands rushed to the rescue. Walter had the paddle, and with rare presence of mind swung the boat around in the direction Jim had taken, calling to us to kneel in the boat and catch him when he came up, as, although he could swim some, the matter of clothes and probable strangling would be a dangerous handicap. He showed signs of being badly strangled as he struggled to the surface, and I nearly went over in a desperate effort to catch his arm or hair; but before I could do so Will grabbed a foot, and in spite of all we could do, would not let go, nor could he alone pull him in. I finally got to him, and together we dragged our nearly drowned companion into the boat. His first act, after relieving himself of about half a gallon of water, was to offer to knock the head off of whichever one of us it was that held his foot so that he could not swim, thereby nearly drowning him.

We lost some little time by this accident, but as soon as we had put Jim ashore so that he could go back to camp and get into dry clothes, we resumed our fishing.

After taking several fish all round, I had a vicious strike, and after a short, hard fight, landed a big, ugly, flat-headed fish, with little beady eyes. None of us knew what it was; but as we supposed all fish were good, and as it was large, we hailed it with delight. The only other event was the large trout that Walter caught. It weighed probably three or four pounds, and put up a fight such as none of us had ever seen, jumping entirely out of the water several times. There was no science in the way we finally all together dragged that noble fish into the boat, but he was a most welcome prize.

Our fish box held an abundance of fish for supper and breakfast, when we paddled to the landing guided by the light of the fire Jim had kindled, and we soon had a supper served that lacked nothing except variety. We ate fish as long as we could keep our eyes open, all hands being tired and sleepy, especially Water and I, and when we could eat no more, turned in and slept soundly the night through.

The next morning after breakfast we started out for a tramp in the woods, carrying the guns in hopes of finding some game. We hoped for a shot at a wild turkey or perhaps a bear, but had no intention of refusing small game.

A yellowhammer was the first game sighted, and almost precipitated a personal encounter between Jim and Will as to which should have first shot. Neither would yield, and we finally had to cast lots, spitting on a chip and throwing up "wet or dry." This resulted in Will's favor, but was an empty victory, as the bird flew off while the contest was being waged. A little later we put a fox squirrel up a tree standing alone, and after several ineffectual shots brought it safely to bag. Very much elated by the prospect of a change of diet, we moved on. Another squirrel was sighted in a tree, which we at once surrounded. It was Walter's shot; so, taking his gun, he began to slip around the tree, looking up for the squirrel. He had reached the opposite side from us, when glancing down to see that the way was clear, he gave a yell and jumped as high and far from where he had been standing as he could.

"Snake!" he shouted, and dropping his gun grabbed a stick. Catching up the weapons nearest to hand, we rushed to his assistance. The snake lay in the shape of a circle, and was very large, and perfectly still. We closed in on it, and could not understand its not moving, until a close inspection proved it to be but a freshly shed skin of a snake, evidently larger than any of us had ever seen. Stretched out, it was, by estimation, fully two feet longer than Walter, who was five and one half feet tall.

The squirrel made its escape while we were engaged with the supposed snake, and we concluded that we would like the hunting better away from that locality.

Noon was approaching, the sun growing hot, and we very hungry, so a return to camp was in order. It bid fair to be a light lunch, one squirrel for the four; but just before camp was reached, a young rabbit was started which was halted by a seductive whistle and shot; so our spirits rose somewhat.

The cooking was not wholly above criticism, but we did not leave any meat on the bones of either squirrel or rabbit, and could easily have been persuaded to eat more had it been on hand.

Our breakfast had been light, owing to the fact that we found my large fish of the beady eyes not in the edible class. Our dinner had not been at all of the button starting kind, so essential to a boy's happiness, and now the larder was entirely empty, except for the meal and bacon, the former being of use only to roll our fish in, and the latter so scarce that it was carefully saved to fry with. Corn bread we did not try to make, supposing that it was necessary to have eggs, soda, milk and other ingredients, which were not to be hand.

In an after-dinner discussion, we concluded that fishing and hunting was but work, when we had to do it for something to eat. We were living literally from hand to mouth, and hustling for each meal.

The serious situation was the subject of long and earnest discussion, but our determination to stick it out did not waver. We finally concluded to go down to the river that afternoon and put out some set lines in hopes of taking some large catfish, quantity being what we especially longed for. We had some heavy set lines and large hooks, and these we prepared by cutting the line into pieces about six to eight feet long, putting a hook on each, and baiting with a minnow, proceeded to tie out in the river to snags and overhanging limbs and roots. It was hard work paddling up and down the river in the swift current, but we persevered until we had out twenty or more lines, and then feeling sure that we could depend on some one of them for our supper, paddled down to a nice sandbar, took a swim and loafed through the remaining hours of the afternoon until time to examine our lines. Visions of a bountiful supper on large fish that would not need careful eating to avoid bones filled our minds as we toiled at the paddles to get the heavy boat back up to where the lines were set. The first one was hanging limp, with the bait gone, but no fish, as was also the second, third, fourth, and so on to the end, with the exception of one of the last taken in, which had one of the same kind of flat-headed, beady-eyed fish that we had thrown away in the morning.

Thoroughly disgusted, we knocked it on the head with a paddle and tossed it back in the river.

It was evident that in trying to get out as many lines as possible, we had cut them too short, and the bait had been taken by gar and other worthless scavengers, instead of catching the fish we wanted, which were bottom feeders.

As we silently paddled back down the lake to camp in the stillness of the twilight, our disappointment was too deep for words. Hungry as boys could be, there seemed nothing for it but to go supperless to bed, and we were certainly too hungry to sleep.

Arrived at camp, I began to cast about in my mind for some means of providing supper, and finally, in desperation, concluded to try to make a soup. Getting out our iron pot, a two-gallon affair, I washed it as well as I could with cold water, and putting in the rabbit and squirrel bones left from dinner, together with a bit of bacon rind, set all to boiling merrily over the fire. Cutting a long stick, I stirred the mixture occasionally, and was delighted when it began to give off a faint savory odor. The boys sat around the fire in an expectant, though skeptical manner, watching my experiment, occasionally trying to tell how hungry they were, reaching a climax when Will declared he could eat a raw dog with the hair on. It was pretty poor soup, but I had done my best, and went to get the salt, concluding to season and serve without further delay, when my eyes fell upon our half sack of meal, and I had an inspiration. Filling a pint cup with meal, I stirred it slowly into the boiling soup, and the result was a cross between a soup and gruel, that was really quite good.

We were four pretty comfortable boys that rolled into bed as soon as supper was over, and not one drop of soup was left. At about what I judged to be midnight I was wakened by Walter, who asked, "Ain't you hungry?"

"Yes, I am," I replied, as soon as I got well awake.

"I have been awake nearly an hour, too hungry to sleep, and trying to think of some way to get something to eat," said he.

We discussed trying to fish, but finally concluded it was no use.. Then we tried to think of some way to hunt at night, but to no purpose without dogs. Our resources next came in for discussion, and when we came to the meal, I said, "Mush is made of meal, and it is good, too."

"Mush!" said Walter, springing up. "The very thing, and I know how to make it. Get that fire made while I bring some water."

We made the big pot nearly full, and it was good mush, but there was none left to fry for breakfast, for the other boys joined us at the first invitation to come eat, and for the second time we retired, full and happy.

There was but a faint streak of gray in the east when I awoke next morning, and taking my gun slipped out to try for a breakfast. A perfect stillness prevails in the woods at daybreak and noon in semitropical or the lower latitude of the temperate zone; but the morning awaking is sudden and glorious. Nature seems all but breathless as the night-prowlers seek their various hiding places, and the birds are waiting in silence for the welcome light that makes it safe for them to begin their morning songs without the fear of discovering themselves to their enemies that hunt in the darkness. It was almost too dark to see the path as I followed the bank of the lake down into the woods; but before I had gone far I began to hear the early birds beginning their low calls to each other. They seemed to be exchanging the most confidential communications, in monosyllables; but as the gray dawn spread down through the trees, the low talk grew into a chatter, which gradually increased until the birds were all singing. It was now light enough for the squirrels to begin to move, and I was in a favorable location, where the woods was thick. I heard the swish of a limb in a nearby beech tree, but could not locate the game, so continued on along the lake bank, hoping to surprise a squirrel seeking its morning drink. I soon heard another out a little in the woods, and standing still to get its direction, found it coming my way, jumping from tree to tree. In a large white oak, near enough for a fair shot it stopped to look about, and the next moment I was retrieving it with a hungry haste that was far from sportsmanlike, but fully in keeping with my feelings. A little further along I was startled by a noisy rush of something up the trunk of a tall cypress tree that grew under a high bank on which I was standing, which took shape as it mounted well up toward the limbs, and proved to be two squirrels in a wild frolic. They were going so fast they seemed almost flying, and throwing up my gun, I fired both barrels at them in a hasty hope-for-some-result way, killing both as nicely as any crack shot could have done.

To say I was pleased is to put the case very mildly; I was half wild. Dropping my gun, I dashed down the steep bank to get them, almost going into the lake in my excitement, and no prouder or happier boy lived than I was as I scrambled back with a fine young gray squirrel in each hand. Gathering up my gun, and not so much as stopping to load, I put out for camp. Three squirrels and the sun not yet up was a feat to be proud of, and I wanted to see the boys open their eyes soon as possible.

Leaving the path and striking across through the woods for a short cut I ran on another squirrel in a tree on which grew a grapevine, and although I worked with feverish haste to get my gun loaded, it made good its escape before I could do so; but did not leave me altogether inconsolable, for on closer inspection I found the vine to be a muscadine, full of grapes, and soon had my hat full of them to carry to camp. It was a warm welcome given me by the boys when I got back, and we

soon had a good breakfast prepared, which we felt sorely in need of. The three squirrels, a pot of mush, and the grapes were all eaten up clean before we had enough, and again we were compelled to take up the question of something to eat. LEWIS HOPKINS.

[TO BE CONTINUED.]

Fish and Fishing.

English Fishing Baits.

WHILE the art of fly-fishing, and particularly that branch of it relating to dry fly-fishing attains to no higher perfection anywhere than in England, it is astonishing to many American readers of British angling literature to note the vast amount of attention and space devoted therein to the subject of angling for coarse fish. Of course there are thousands of British lovers of the gentle art, who have no possible opportunity to indulge in the luxury of angling for what are known as sporting fishes, and to these the catching of chub and carp and barbel is sport indeed. But there are some fishermen, even among those who have occasional access to trout streams, who pride themselves upon their skill and success in luring the silvery roach and dace and chub to their baited hooks. Fully as much discussion is indulged in as to the relative value of different kinds of paste for bait, as one hears on the banks of a Canadian salmon river in regard to the killing qualities of the various flies which adorn the fisherman's books. There are pastes made directly from flour and others from freshly baked bread. There are some mixed with honey and others with cheese. Some are flavored with one drug and some with another. In some cases cotton wool is mixed with the paste to prevent it from washing too easily from the hook. Some anglers use the maggots from a wasp's nest and others those known as gentles, which are obtained by leaving a piece of meat out of doors to be blown upon by flies. Others fish with cherries, and some again with haws and other berries. To those who have not been accustomed to the different baits employed by British anglers in their coarse fishing, the various reports in the sporting papers of the relative success obtained by these different baits must prove very amusing reading.

Tickling Trout.

I very well remember, when a small boy in one of the midland counties of England, the sense of admiration which I entertained, in common with a number of youthful fishing companions, for an old man—I suppose now that I should be justified in calling him an old poacher—who captured large trout from a brook by quietly taking them in his hands from their usual haunts beneath overhanging roots or rocks. He told us that all we had to do was to tickle the trout and that they would make no effort to escape. The trouble with we boys was that the trout never waited around to be tickled by us, and of course the old man smiled at our lack of success, but never initiated us into the secret of unobtrusively approaching the wary fish from behind, while keeping thoroughly concealed from their view. We practiced upon minnows, with which we became somewhat successful, so long as they were cornered in a minute bay of very shallow water; but when it came to the turn of *Salmo fario*, we were simply not in it at all. Since that time I have heard and read many descriptions of trout tickling, none of which, however, are more practical than one at present before me, in a new book entitled "Sport Indeed," from the pen of Thomas Martindale. Speaking of trout tickling in the River Wear, in Durham, he says: "This is how the tickling is done. The fish are watched working their way up the shallows and rapids. When they come to the shelter of a ledge or a rock it is their nature to slide under it and rest. The poacher sees the edge of a fin or the moving of a tail, or maybe he sees neither; instinct, however, tells him a fish ought to be there, so he takes to the water very softly and carefully and stands up near the spot. Then he kneels on one knee and passes his hand, turned with fingers up, deftly under the rock until it comes in contact with the fish's tail. Then he begins the tickling with his forefinger, gradually running his hand along the fish's belly further and further toward the head until it is under the gills. Then comes a quick grasp, a struggle, and the prize is wrenched out of his natural element, stunned with a blow on the head, and landed in the pocket of the poacher." Salmon, as well as trout, are tickled by poachers in some of the north country rivers, and as neither tackle nor tool of any kind is employed by them, it is often difficult to secure their conviction.

The practice of trout tickling was not unknown to Shakespeare, who makes mention of "groping for trouts in a peculiar river," and causes Maria to exclaim in "Twelfth Night, "Here comes the trout that must be caught by tickling." So Beaumont and Fletcher, in "Rule a Wife and Have a Wife," written about 1624, place in the mouth of one of their characters this line, "Here comes another trout that I must tickle, and tickle daintily." Both Oppian and Ælian refer to the snaring of trout by tickling them with the hand, as practiced in their age. Ælian's account of the proceeding is that "men wade in the sea when the water is low, and stroking the fish nestling in the pools, suddenly lay hands upon and secure them." Oppian's description is as follows:

> "The fish in careless ease supinely laid,
> The grappling fingers of the swain invade.
> Up from the deep he springs, and bids the prey
> Recant his error in aerial day."

Fish Planting in the Great Lakes.

It is doubtful whether any expenditure by the Governments of the United States and the Dominion of Canada is attended by so large a return as that made for the purpose of maintaining and replenishing the fish life of the Great Lakes. When the Joint Commission of the United States and Canada on these fisheries, which reported in 1896, was appointed, over-fishing in the lakes and a disregard of the close seasons, had done their deadly work to such an extent that the commercial fisheries, which have been estimated by a recent writer to exceed in value the importance of these waters as a vast highway of traffic, notwithstanding that the volume of freight passing through the canals at the Soo exceeds twenty millions of tons per annum, were in danger of total destruction. Those who are interested in the details of the great work which has been done by the National Government during the last six or seven years, for the preservation and improvement of these fisheries, will find them in the annual reports of the U. S. Fish Commission; but in reading a magazine article the other day by Mr. W. S. Harwood, I was much struck with one of the illustrations furnished by him of the vast returns derived from the work of the Commission. "During last season," he says, "the Commission deposited 19,000,000 trout and 326,000,000 whitefish in the Great Lakes. The average cost per million for gathering the whitefish, as shown by one of the principal hatcheries—at Put-in-Bay, O.—was $13.95. Allowing this figure for the entire whitefish collection would bring the cost up to $4,500. I do not suppose any one can give any accurate estimate of the number of these healthy fish—for only the strong and healthy ones are distributed—which will survive, but should one-half of them reach a six-pound maturity, their value at low current prices will be $100,000,000." From what other sowing may such a harvest—an increase of over twenty thousandfold—be reaped? E. T. D. CHAMBERS.

Stray Notes in Fishing.

THE man who knows all that can be learned about fly-fishing has yet to be born.

We have met a few anglers who thought they knew it all, but these have usually been sages of one season.

A fisherman who has passed a long life on one trout river may become wonderfully expert in luring its finny inhabitants, but will occasionally learn some new wrinkle foreign to his experience.

Eye hooks are slowly making their way in this country. If the eyes of all that are imported were properly made they would probably be more popular.

The eye of the Pennell hook, which is intended for the jam knot attachment, should be just large enough for the gut to pass through freely, otherwise it is not really a safe fastening.

When hooks with large eyes are used the gut should be passed through twice and a single knot made round the main line. If the gut is not perfectly soft it is sure to be chafed in slipping this knot down to the eye and pulling it tight. The old figure of eight knot used for salmon flies is perhaps a better attachment.

Some of the Hall turned-up-eyed hooks are made of fine wire, and in the larger sizes are apt to spring. We remember losing several good fish through this fault, and are not reconciled yet to the loss of one of these, a noble rainbow trout.

We found many of the eyed hooks called long May's—they are made for May flies—over-tempered and brittle. Three were broken in fish on one occasion, when we were using the dry fly over a school of very shy trout. It was one of those hot humid days when it takes all you know to get a rise.

Eyed hooks are certainly best for dry flies, but it is questionable whether they fall as lightly on the water as flies tied on tapered shanks. It is easy to tie flies on them, and the body can be made very neat and slim. We have found the true Pennell excellent for hooking and holding.

It seems impossible for hook makers to stick to exactly one form in any brand of hook. Three years ago we thought that we had got perfect Sproats at last. Each year since the shanks have been made shorter, until now many hooks in each box are useless. The bend has also been changed a trifle every year.

Many hooks are too cheap to be good. We have seen good-looking Sproats for sale as low as fifteen cents per box of 100. Competition must be very keen in the business of making fishing tackle of all kinds, but nearly all anglers are willing to pay a fair price for reliable articles.

Fond as we are of sport, very few Americans make it the first object in life as we hear is done on the other side of the big sea water. The seasons on various rivers over there run in such a way that salmon can be fished for nine months in the year, and some men do it.

It would be delightful to spend spring, summer and fall in the United Kingdom and take in all the fishing resorts of which we have read or heard. The chalk streams of England, the lakes and rivers of Scotland and Ireland. The latter must have been quite a sportsman's paradise not so many years ago.

It is quite possible to have fishing too good. We experienced something of the kind in Maine many years ago. We found on our arrival at the first lake that the camp keeper had buried a large quantity of trout that morning. We dragged a floating box about after that and in reeling up would take a look at the fish, then return them to the water. Trout were served to us three times a day for weeks, and we have seldom eaten one since. At a hotel in Wisconsin, situated near celebrated fishing, we saw nearly half a ton of fine black bass going to waste. So many were brought in daily that they could not be used.

High up on the Asiatic shore of the Pacific are many rivers so crowded with salmon and other migratory fish that they are crowded out on the shores and shallows in thousands. The stench of decaying fish can be smelt four miles away. (See the "Cruise of the Marchesa," a book well worth reading, we may be allowed to observe.)

Sport does not necessarily consist in taking great numbers of fish. If trout in any water run small, for instance, the excitement is in getting many rises and skill is shown in striking. A few fish of good size on a shy water will satisfy any angler of a reasonable turn of mind.

That is one benefit, at least, that we have derived from the introduction of the brown trout (*Salmo fario*). We catch larger fish and the average is much better than it was in the days of exclusive brook trout.

The prejudice that certainly existed against *fario* at one time appears to have passed almost entirely away. This fish grows very rapidly and seems to thrive everywhere, not only in this country but in Australia and New Zealand. We have seen some very large specimens, and its size seems to be only a question of water and food supply. This is largely the case with all trout, but monsters of this species are sometimes found in small brooks.

Nearly every one has heard of the big fish that had its home in the abutment of a bridge near Big Indian Station in the Catskills. We have been favored with many estimates of the weight of this fish from 4 to 7 pounds mostly, and have had notice of his death many times, recently that he had been shot. We have often watched this fish when out of his hole, and can bear witness that he was an ugly, black, big headed brute. There were other fish there, however, one not so large, but a real beauty.

These big trout haunt the same pool for many years and are quite safe if they have a retreat at hand under great rocks, the abutments of bridges, the aprons of old dams and other inaccessible places, otherwise they are sure to be foully dealt with, as there are always some persons whose covetousness is so aroused by the sight of any fish of unusual size, that they will resort to unlawful measures to possese them.

If the water is perfectly clear and smooth, large trout may be actually run down or hunted to death even in pools of considerable size, if they have no hole to slip into. They become blown or lose their heads completely, and will lie at last like stones upon the bottom. They are then easily snared. This may be doubted by many persons, but we saw the thing done many years ago in a large pool in the Neversink River.

This is one of those "white" water streams, and clear as possible. Two farmers were snaring suckers, when they discovered three large trout, which they determined to have. When we saw them they were beating the water and chasing the trout from one end of the pool to the other. There was but one place under shelving rocks where the trout could really hide, and this was not deep enough to prevent their being poked out. We passed on to our fishing, never dreaming that these fish were in real danger. On returning to our quarters that night we learned that three great trout had been captured. These were from the first planting of brown trout, about 1886.

We believe that trout can observe a strict fast for lengthy periods of time. Black bass are said to fast more and more freely as the temperature of the water rises. The habits of trout are different, warm water having an enervating effect. We have seen them apparently glued to the bottom for many days in summer, the movement of the gills being so slight as to be scarcely perceptible.

A good deal of minnow fishing has been practiced of recent years, and some very large trout have been taken with helgramites. Early in July this season, several big fish were taken under the dam at Henryville, Pa., with this bait.

Trout become very timid when the water is low, but if a freshet causes them to effect a change of base, they feed freely and may be readily taken. When a big fish is strong on the feed he becomes very bold and loses his usual caution to a considerable extent. We have had trout of over six pounds take the fly within fifteen feet of our position.

Our native brook trout is not in the habit of leaping when hooked; rainbow trout do so constantly, and are one of the gamest fish in the world. If the water is warm brown trout are apt to be sulky; no fish is more exasperating than a trout that will not fight. It is very apt to escape, as it preserves all its strength until the last moment. Brown trout show great spirit if the temperature of the water is fairly low. We used to think that they did not leap, but have since had days when nearly every fish left the water at least once. Many anglers think that this fish plays more tricks than the brook trout. It is surely a game adversary.

It is said that if brook and brown trout, of the same size, are cooked together, there is no difference in the flavor. A blind-folded person will enjoy one as much as the other. We think that big trout should be boiled. Some of these are almost equal to salmon, cooked and served in the usual way.

Fly-fishing affords an endless field for speculation, observation and study. We are always learning something. This is no doubt the reason why it rarely loses its fascinations for us, even in old age. Christopher North (Professor Wilson) had his fly-books brought to him when on his death bed, and he would wade and fish when he could walk only with the assistance of a cane.

Sir Humphrey Davy's greatest regret was that he had not learned the art of fly-fishing until after he reached the age of fifty.

We wish that anglers generally were more interested in entomology than they are. When trying to make a good imitation of a particular fly we have frequently sent several different shades to friends for trial. They are usually so much interested in taking fish that they fail to note which fly is most successful, or use it until completely worn out. We have heard that the water flies of the far West are peculiarly interesting, some species being very abundant at certain seasons of the year.

One of the greatest angling exploits of which we have ever heard was accomplished by a well-known resident of New York city last season. In the presence of two witnesses he landed 200 black bass in one day's fishing. All were taken with a 4½-ounce rod and artificial flies, and none were killed, having been returned to the water immediately. We do not know how large these fish were, but it was surely a wonderful performance. Allowing three minutes for each fish, it required ten hours' of active exercise, which might, by some people, be considered very hard work. The scene was a well known river in Virginia, in which State some of the best fly-fishing for bass in the country is now found.

We think that there is room for improvement in patterns of flies for the black bass. In the South, where the big-mouth is very numerous, we were astonished to find how great was the difference in killing power between one fly and another. We tried a great many before learning their tastes, then rose about every fish that moved. There was no hesitation, the fly being frequently taken the instant it touched the water. The first rush of these fish was a fine effort, though they have not the endurance of the small-mouthed black bass. One man of large experience assured me that a small-mouthed black bass, with a red spot in its eye, was found in the far South. We never saw any such fish.

Last week the streams, in eastern New York at least, were in fine order, as one of my friends on the Neversink says, it is like old times. On several days the river could not be crossed by wading in the neighborhood of Williams. The Beaverkill, Neversink and Esopus are all large streams and are called rivers on the maps.

Fish of twenty inches were caught with the fly last week. Of course no one need expect large scores of big fish, but good sport can be had by persevering anglers. Some men poach up the small brooks in which fry are liberated in the spring. It is a poor business, despite the numbers of small fish taken, and should be discouraged.

We like to feel a distinct shock, a slight chill on entering the water for a day's fishing. If the water is cold there is a fair chance of making a basket of trout. It is not a bad plan to carry a small basket in summer, at it is not so hard to fill. It is sometimes hard work to make a showing with my twenty-pound creel.

THEODORE GORDON.

A Night with the Rock Bass.

Editor Forest and Stream:

I wonder if that dear old father of angling, Izaak Walton, ever had the pleasure of coaxing a 20-pound striped bass from the blue waters of the sea with an eel tail? I spend a few days each fall at Corson's Inlet, New Jersey, about two hours' ride from Philadelphia. A jolly crowd of fishermen will be found almost any evening at this time of the year around the fire of "Gus" Wittkamp. Gus is a good fellow and his door is always open; the coffee pot is never taken from the fire, but is always hot for the use of those who wander out all hours of the night on the bridge, which is but a minute's walk from the house.

It is ten o'clock and very dark. The rain that has been falling all evening has now stopped, and a moaning wind is all that breaks the silence without, except once in a while the surf some distance away breaks with a dull thud upon the beach. The story of battles royal of some big rock fish is being told for the sixty-seventh time, when footsteps interrupt and the door opens, and out of the black night Butch, who disappeared at the beginning of the story, calls out, "Come, boys, the tide is running hard and I heard a rock break just beyond the draw bridge." We rise as one, and get our rods, calling to Gus to keep the fire up and have the cookies and coffee where they will be handy when we come in. The eel tails are looked after again before we start out into the darkness. All is well and the start for the bridge is made. True enough, we hear the splash—splash, as the big fellows chase the winnows, which go skipping over the water like frightened sheep. We are not long getting our eel tails on the water and troll slowly along. There comes another splash which sounds like a man overboard, and we turn and peer into the darkness and wonder what would have happened if he had hit us. We grasp our rods firmer and press on our leather reel brakes to make sure everything is working right. What's that! The line tightens and starts to run out at a ten-mile clip, making a peculiar singing sound as it cuts through the water. A rock has at last taken the bait, and all the wickedness of the fish is brought into play. The faithful rod creaks and groans from the strain of the awful rushes; the line runs off twenty, now thirty yards, before being checked. He rises from the deep water and beats his tail in anger upon the surface; then is off again, ten more yards, before he is finally halted. The fight is too fierce for him to stand, and gently we bring him closer, but not until after a few more desperate efforts to regain his liberty. The gaff, after a few unsuccessful jabs, at last brings him to terms, and the beauty is ours. We light our pipes again, fix our eel tail that has been pretty well chewed, and start in where we left off, for a good night's fishing has just began.

P. A. W.

Pennsylvania Association.

THE Pennsylvania Fish Protective Association will celebrate the twentieth anniversary of the organization in a meeting at the Manufacturers' Club, Philadelphia, this Saturday evening, Nov. 15, at 8 o'clock. Mr. William E. Meehan will deliver an illustrated lecture on "Fishculture."

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Texas Tarpon.

TARPON, Texas, Nov. 5.—*Editor Forest and Stream:* Between 4 o'clock and 6 o'clock last evening at this place I landed eight tarpon, beaching all of them, and turning six of them loose for some other fellow's future sport. This is the most rapid tarpon fishing that I have ever heard of; and, if any of your readers know of anything to beat it, I would like to hear of it through your columns.

I came here on the 17th ult., and have since landed in twelve days' fishing twenty-two tarpon out of forty-six strikes.

Yesterday in the forenoon I landed a seven-foot shark that would weigh about 375 pounds. It was hooked foul, so gave me an extremely tiring struggle. I have saved his jaws, which are so large that when open they pass easily over one's head.

Three days ago I hooked my first leaping shark, and was delighted with the sport that it afforded. It is as game a fish as any sportsman could desire to tackle. Mine jumped four times, and on its first run took out nearly 300 feet of line, with all three brakes set. It took me fifteen minutes at least to land the fish, although it measured only five feet five inches in length and thirty-two inches in girth. Its weight was about eighty pounds. The leaping shark is magnificently built for running, and is by no means a bad looking fish, if fish it can be called.

This morning in a few minutes my wife landed on tarpon tackle two jackfish weighing about twenty-five pounds each. They fought fully as hard as fifty-pound tarpon would have fought; but, of course, did not leap at all.

The middle of October is a pretty good time to come to this place, notwithstanding the fact that there are very few sportsmen here then or later. Occasionally the tarpon leave the pass as early as Nov. 1, but they often stay till December. All depends upon the severity and coldness of the northers.

This year we have good reason to anticipate two or three weeks more of good fishing.

In a subsequent letter I intend to tell you of the most brilliant tarpon fight that I have ever seen or heard of. It occurred out on the Gulf, beyond the end of the jetty, the fortunate sportsman being Mr. L. G. Murphy, of Converse, Ind. I shall also have a few more remarks to make concerning tarpon tackle, as the latter is being improved constantly, and is still susceptible of much improvement.

I am sending you under separate cover a photograph of the record catch for Aransas Pass, made this year by Mr. J. R. Wainwright, of Pittsburg, Pa. It consists of thirteen large tarpon landed in one day. Am sending also a photograph of a catch by Mrs. Hetfield, mother of the proprietor of the Tarpon Inn. It was made one day just about two years ago, and consists of four large tarpon.

J. A. L. WADDELL.

Some More Cottonwood Bass.

COTTONWOOD FALLS, Kan., Nov. 7.—After an absence from the office of four weeks in the political campaign, I arrived home on the morning of election, and was condoled with by several friends, with the remark, "It is too bad, Judge, that you have been away during four weeks of the best bass fishing there has ever been had on the Cottonwood River, but you are too late now, for they have been all caught out." My reply was, "I will investigate the latter part of the week and see if all have been caught."

Yesterday morning a friend and I left the boat landing, went two and a half miles down stream, kindled a fire, broiled beefsteak and boiled coffee for breakfast, finished our meal by daylight and then began operations, with no results until about 9 o'clock. Then trouble began—for the bass. They found our crawfish and chub-minnow bait "just to their taste," and except for the cold north wind, which forced us to warm by a fire of driftwood twice during the forenoon, we had a good day's sport. Especially did the writer; but my friend had an off day, for while I caught twenty-five large-mouth black bass, he could not catch one, and although fishing by my side in the boat and using the same bait, he only had one nibble during the entire day, and failed to hook that one. He usually is successful as a fisherman, and the cause of his failure this day we have failed to find in trying to account for his poor success.

This afternoon, Friday, the sun coming out very warm, I started out for a trial with four crawfish and one dozen chub minnows, and trolled down the two and a half miles with a Skinner spoon, and had one strike, but failed to hook. Then I fished back over the ground as long as my bait lasted and caught twelve bass, and then I put on a No. 3 Buell spoon and trolled back for the mile of distance remaining and caught five good bass with the spoon hook, with about 100 feet of line behind the boat. I found they made far more fight when hooked on the spoon than when caught with baited hook, and it kept the reel on the split bamboo pole singing lively before each one was landed in the boat.

Selecting ten of the largest of yesterday's catch, and six of to-day's catch, and then culling the sixteen down to ten, I made friends look pleasant with presents of the surplus of the twenty-five caught yesterday and the seventeen caught to-day. The ten largest bass of the two days' catch, when dressed, ready to take to my family in Topeka, were put upon the scales and weighed 23 pounds, and as they were of about equal size, they made a very fine string. I took delight in showing them to the friend who had said that I had stayed away so long that the bass had all been caught out, to be told by him, "Well, it will be good news for the bass, when they learn that you have to go to Topeka and will be gone on a four weeks' trip." I do not remember ever having two days in succession of such "good luck" in all my previous fishing experience.

His Mother—"Get up, Tommy. You know the early bird catches the worm." Tommy—"Well, I ain't going fishing to-day."—Detroit Free Press.

CHICAGO AND THE WEST.

Record Small-Mouth Bass.

CHICAGO, Ill., Nov. 8.—What is no doubt the largest small-mouth bass taken in the West this year was captured during the past week by Mr. Robert Forsyth in Green Lake, Wis. This fish weighed in Chicago, according to reports of two or three witnesses, seven pounds, six and one-half ounces. I did not see this fish myself and cannot offer the record as fully authenticated, but if the weight be correctly given, the fish was a very large one.

Stocking the Prairie River.

I have in times past had much to say about that truly beautiful little trout river, the Prairie River of Wisconsin. I do not know a sweeter stream in the world for wading and fly-fishing for trout, though of late the fishing has not been what it should have been, owing to depredations of different natures at the hands of unscrupulous fishers. It is pleasant to be able to say that, in addition to the other plantings along this stream, Mr. Bates, one of the farmers living along the stream above Dudley's place, has planted 100,000 fry in the upper river this fall, these fish having been obtained from the State Fish Commission. The Commission has always been liberal in regard to plantings in this stream and its tributaries, and it is to be hoped that this work will result in the continuation of the sport along that pretty water.

Chicago Anglers.

Some Chicago anglers went out for bass this afternoon, and will continue to go out until a freeze, which may come at any time nowadays. The sport, however, will not be very good, depending altogether upon the locating of the fish in the deep water. This is the time of year when successful minnow fishing for bass can at times be had along the streams in the deep holes, where the bass drop in to spend the fall or winter. I should think this kind of fishing, moving down along the streams, would be better fun than the bleak and somewhat cheerless aspect of the sport of bass fishing afforded by boat fishing upon the lakes.

Wood Duck Feathers.

CHICAGO, Ill., Nov. 1.—Mr. Theodore Gordon, of West Haverstraw, N. Y., writes as below in regard to his present needs as a fly-tier:

"I know that you have applications from readers of FOREST AND STREAM living in all parts of the country asking for information or assistance. I understand that your prescriptions are always successful, so venture to trouble you on my own account. I tied a fly several years ago with summer or wood duck wings, which has been very killing, but am running short of feathers. I refer to the plain mottled feather, not the barred black and white. If you have leisure will you put me in the way of getting some of these feathers?"

I imagine that if Mr. Gordon will write to George Sloane, commission merchant, South Water street, Chicago, or to Randall Bros., commission merchants, South Water street, same city, inclosing a small fee as a gratuity to a salesman, he will get the feathers he wants, provided he makes it quite plain just what feather he requires. These commission firms occasionally supply feathers to fly-tiers, though they are more accustomed to seeing the latter prowl along the street and rob the displayed birds of their plumage.

If Mr. Gordon fails thus, let him write to Mr. Graham H. Harris, Ashland Block, Chicago. The latter is a most excellent good tier of flies, purely amateur, but usually fairly good-natured when not wanting to go fishing and finding himself unable to do so. Mr. Harris knows where to get all sorts of feathers. A fellow in New York sold him a bird not longer than your hand the other day, and it cost as much as a suit of clothes, but he had to have it, being engaged on a work of art which called for a feather raised only by that particular sort of bird, which grows only on some sort of desert island in foreign parts.

Good List of Michigan Flies.

In getting up my stock of flies for next year's fishing over in Michigan, I enlisted the aid of Mr. W. B. Mershon, of Saginaw, who is as well posted as any man in the State upon what is needed in the way of trout flies. Mr. Mershon's letter came in the way of personal reply, yet I think he will not dislike to see his advice placed where it may help others also. His mention of the McGinty, Mershon and good-evening patterns will be new to many anglers, though they are all popular with the Saginaw Crowd. The list given is, of course, not exhaustive, nor does it comprise a tenth of the assortment commonly found in a fat Saginaw fly-book when the crowd is out for war. The specifications follow:

"Off hand, I should say the following flies, in something the order named: Whirling-dun, 8 and 10. This takes the place of the alder. There is another dun, a little slate-colored fellow with mouse-colored wool body and tail, which I have found a good early fly, though I have forgotten the name of it. Next comes Cahill, 6, 8 and 10, the largest size rarely required. Beaverkill, the same. Cowdung is not necessary, on account of similarity, but an old favorite, light-Montreal, dark-Montreal, Montreal, with a silver body. The Mershon is made by Mills & Co., 8 and 10. Get plenty of McGinty, for trout are freaky, and it is a freaky fly. I should have them in 6, 8 and 10, mostly 8, and a good supply of them. Some people like the brown-hackle and the coachman. I have never had much luck in Michigan with either of these flies. Queen-of-the-waters in 6 and 8 is good.

"You should have a few English floating-flies, for dry fly-fishing, for there are times when you can raise trout to them when they will not come for anything else. There are also times when you should have some 12's, in light grays, like mosquitoes, to use with gauze leaders, though for steady fishing this would not be much fun. Of course you can have a larger assortment. I have a good many. I get the good-evening in 6, 8 and 10, red body, turkey wing and pheasant tail. Then there is the pale evening dun, the Grannon, black-gnat and a lot of others, though those I have named will be sufficient for one. I have some

of my flies tied on long-shanked hooks, No. 8, so as to make a big fly, but a small hook. I have referred to the sneck bend hook, and to the stream patterns. By the way, don't forget to have some Stone flies; they are great at times."

There is no fly more vaunted than the brown-hackle, yet I may join Mr. Mershon in his experience. The coachman I have found more useful, though I can't say I ever gave it much of a test in Michigan trout fishing.

The above list of flies should be useful to one making up a book for Wisconsin. For the latter State I would suggest the addition of coachman, alder, cowdung (for early fishing), also grizzly-king, gray-hackle, and sometimes the Reuben-Wood. There is a good fly out this summer in our shops, perhaps old elsewhere, the Carleton, which is thought good at times, in 8 or 10. I should always like a few silver-doctors along, up to 6 in size, the English pattern, with thin body, pale turkey wings and peacock hurl in wings having proved a killer in some of my experiences. The tinsel on this fly does not tarnish, and it casts well. I think trout may strike it for a young minnow. It is one of those freaks which sometimes go, at least. Hare's-ear is another good fly to have along. I have sometimes tied a sort of rough hare's-ear with a raw wool body, and wings of the widgeon shoulder feather, and this fly killed at the time it was used—May—in northern Wisconsin.

After the first of August, indeed after the middle of July, Michigan takes a smaller fly than Wisconsin, and the Au Sable streams are best fished then with ten or even twelve at times. Some streams require larger flies than others. I have often mentioned Mr. Miller's preserved stream, the Pine. It calls for No. 6 nearly always, and one could possibly kill fish there sometimes on even a larger fly. No 8 will do there, but 6 nearly always much better. Yet this is a very bright, clear water. I have earlier mentioned the freakishness of the fish in this water, and their leaning to bright flies. The wild streams of Michigan and Wisconsin call for larger and brighter flies than stocked waters, usually. No one can account for all these things, but with the above assortment of flies he can account for a basket of fish in either of our two trout States.

E. HOUGH.

HARTFORD BUILDING, Chicago, Ill.

The Tomcod Fishing Season.

WHEN the leaves begin to fall and the crisp nights of autumn follow the balmy days, the local anglers who can spare a few hours' time from work or business hasten away to their favorite haunts and angle for tomcods. Some spots are better than others, of course, but when the run of tommies is large they frequent all of the salt-water reaches and furnish fun for countless thousands of men, women and young people, who have neither the time nor the means to go fishing as other and more fortunate persons do, to far-away resorts where game fish are abundant. Like the tiny lafayette, the tommy is a fish for the people, and the people go after tommies with enthusiasm worthy of bigger game.

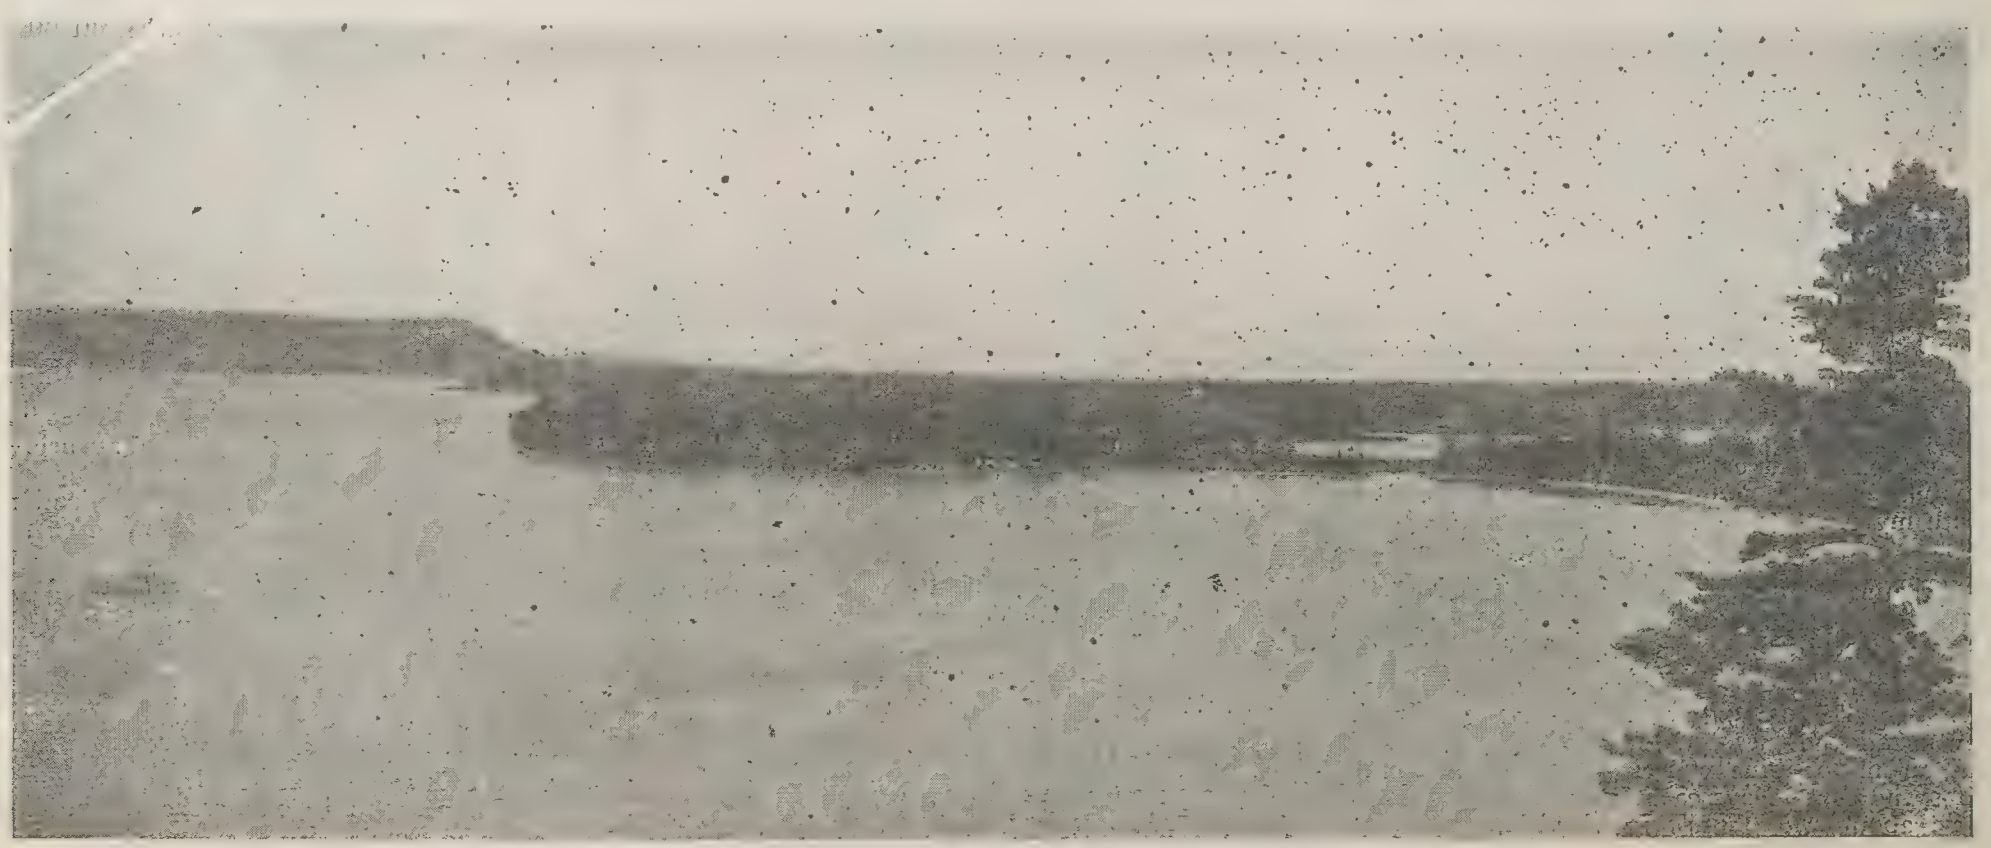
The tomcod, or tommy, is the frostfish (*Gadus tomcod*), which enters the rivers early in the autumn on its way to the shallow waters, where it spawns in December. It is not a large fish, and the angler who takes several weighing about a pound each considers himself fortunate, while the usual catch will average below rather than above a half-pound, I fancy. The average fisherman keeps every fish he catches, and often dozens are seen in the fish baskets that average nearer two ounces than a pound. But the fish is well liked as a pan fish, and several of the larger ones, nicely cooked, are not to be despised by any means.

The lafayette visits the waters round about New York city in late summer and early autumn, and is followed by the tomcod. The latter, being larger, attracts the attention, not of greater numbers, but of the habitual angler in salt waters as well as the casual fisherman with rod or hand line. The pierheads are generally sought by most of the anglers, and these swarm with human beings all day long; but club house floats, favorite nooks along the sea wall, all of the points along the New Jersey shore, and every jutting rock holds its fisherman while the run is on, and every available boat is pressed into service by persons who have a day to devote to the sport. Saturday afternoons and Sundays see the largest crowds along the Hudson, but on Election Day, which was warm and fine, every man who could muster a rod or a hand line seemed to be out, and the number of boats anchored along shore was greater than usual, while at Fort Washington Point and in the little bay below it the river was dotted with boats every few yards, and thousands of other anglers for tomcods were perched in various places along shore. Many a poor man who had no vacation last summer blessed the fine weather of Nov. 4, and throughout the long winter will remember with pleasure the fun he had on that day. Fish or no fish, it was good to be out.

The universal bait for all sorts of fish that may be caught along the water front is sand worms, and these are also used for tommies. Hooks are quite small, sinkers as large as usual, and hand lines the most common, although salt-water tackle of every sort is seen. The short, heavy, stiff rods and big wooden reels are commonly found in the hands of the old-timers, but there is also a sprinkling of more slender rods and multiplying metal or rubber reels carrying finer lines than those used in hand casting, with not a few oiled silk. But as long shots are the rule in placing the line where it will do the most good, and the ebb tides of autumn are strong, very heavy sinkers are employed, and these are either pear-shaped or flat and oval. Some of them must weigh four ounces or more, and woe betide the head that falls afoul of one of these whirling weights.

The persistence of many of the anglers for tommies is worthy of something better. Fair weather or foul, blow high or blow low, a sprinkling of enthusiasts may be seen any day from dawn until dark, patiently angling for the elusive tommies. Some provide themselves with heavy ulsters or rain coats, and even umbrellas and fishing rods are boon companions with pipes and liquid bait on raw, cold days in the early winter. It is interesting to watch these men at their sport. One who has the inclination to visit their favorite resorts at dawn may find them fishing, and dusk of the short days sees them still trying for one more.

PERRY D. FRAZER.



GLEN LAKE—THE CAMPS OF THE KINGFISHERS.

Camps of the Kingfishers.

CENTRAL LAKE, Mich., Oct. 16.—*Editor Forest and Stream:* I have sent you a photograph of Glen Lake, Leelanau County, Michigan, near the outlet of which lake the Kingfishers have camped the past two seasons (1901 and 1902).

The view is taken from a hill opposite the camp and shows the tents—or most of them—along the shore. To the left is the eminence familiar to those who sail on Lake Michigan and known as the "Sleeping Bear." On the right are the two "Fisher" lakes, through which flows the stream which leaves Glen Lake not far from our camp, and empties into Lake Michigan. Near the Fisher lakes you can see the house of Mr. Burgess, whom we found a very convenient and obliging neighbor.

A LAKE SUPERIOR BIRCH.

The camps were very pleasant ones, although the fishing was nothing to brag of, yet Kingfisher said that he had made "records" enough and didn't much care whether or not he made any more. When he was taken ill and left the camp, it was hardly the same place. My letter from him, within four days, is written in good spirits, and one later, from another of the party, states that he is out and walking around. I send also a photograph of a canoe in which I have done some cruising this summer. It is an old Lake Superior birch, which was given me by Rev. Luther Pardee, of Chicago, and which, being in bad repair, has remained stored in my loft for several years. There used to be canoe birches in these forests, and birch canoes have been made here since I came to this region, but I doubt if any are left, so I covered the craft with a canvas skin—10-ounce duck, with no seams at all, put on a coating of boiled linseed oil, with a little umber and turpentine added, wired on some outriggers, screwed on a pair of bow-facing oars, and—there I was. It is a very satisfactory canoe, and doesn't leak a drop.

KELPIE.

Some Emergency Diets.

THE hardest fare that six strong men and a boy of 15 ever kept alive on was the daily menu of the Windover's survivors, who were cast up on the Irish coast near Kilsegg a few weeks ago. They lived for sixteen days on stewed rope yarn, without a crumb of anything else to help digest it, except water; and, though it made them ill, they kept alive on it and did not waste away very much.

The Windover was a bark carrying salt between Spain and the States, with an English crew, and she was dismasted and abandoned about a thousand miles out on the Atlantic. Three of the crew were killed by falling masts, and two others were washed overboard; but the other seven took to the whaleboat and set out for Britain. Being in too much of a hurry they took too little food, but three large butts of water, besides the tank the boat already held. The result was they ate up the provisions in four days, but had water enough for a month, and, after starving two days more, they tried boiling lengths of tarred hemp rope into a pulp and swallowing it. They had a keg of paraffine wax, and, though it made them very ill at first, they eventually contrived to live on the boiled hemp, the tar, boiled to a jelly, adding to the nourishment of the rope. They landed in comparatively good health.

Two men who went to a small island off the Irish coast a little while ago kept themselves going for ten days on a diet almost worse. They landed in a boat, which was smashed by a wave on their trying to relaunch her, and they were left on the bare, rocky island, which has only a slight scalp of coarse turf, without food. Fortunately there is a spring on the island, but nothing in the way of food but gulls, which they could not catch, and nothing to make a fire with as a distress signal. There are not even any shellfish, as there is no beach, and the pair had to subsist for the ten days on cold raw seaweed washed up by the tide. For two days they starved, but after that they tackled the seaweed, making three meals a day of it, until rescued. When taken off they were a good deal emaciated, but no ill effects resulted. The same thing happened off the same coast five years ago, when four fisherwomen were imprisoned on an inlet by the loss of their boat. They lived on "kelpie" grass for six days.

A diet of boots is one of the commonest of last-resource foods; and, though it is hard for a well-fed person to imagine that any one could masticate and digest shoe leather, a pair of long seaboots will keep a man alive for a fortnight, if he has a little water. Capt. Maboly, of the foundered steamer Gwalior, and his second officer, created a record last year by living for seventeen days on boat leather and a pint of water per day each.

Of course, no teeth can tear cowhide boots; they have to be cut up and shredded with a knife, and the shreds chewed and swallowed. Boiling, even when possible, does no good at all, but takes from the boots what nourishment they contain. A few ounces of leather, being so hard to digest, stays the stomach for fifteen or twenty hours.

The best known and most useful of starvation diets for wrecked or castaway people, however, is that of barnacles, and if anything of the kind happens to you they will probably be your staple food. Barnacles are long, tough, half shellfish, half vegetable creatures, that grow on the under sides of vessels. Three Englishmen and a crew of Lascars who had been forced to abandon the sailing vessel, North Star, a few months ago, kept themselves going for over a week on barnacles, and only two of the crew died. The worst of them is that they give one internal cramps and cause an insufferable thirst; but they do nourish the frame. You have to reach under the vessel's side and pull them off, taking care not to leave the best half of them sticking to the planks. Only a starving person could possibly eat them. Many a castaway crew, however, has found them better than nothing.—London Answers.

Miami River Pollution.

Editor Forest and Stream:

Once more public attention is called to the terrible sanitary condition of our rivers. For many years the Great Miami has been the dumping place for our cities, and as a result the river is becoming so foul and polluted, that, to put it in the fisherman's parlance, "it will soon be impossible for even the carp to live in it." You can go anywhere along the river and see piles of cans, bottles, kegs, boxes and other refuse, scattered along the shore or collected on the riffles and islands. With so much refuse in the water, is it any wonder that our fishing grounds are ruined? The effect of this wholesale poisoning is shown by the following clipping, taken from the Dayton Daily Press:

"A crowd of boys and men congregated along the banks of the Miami River yesterday taking fish from the water that were dying from poison in the water, supposed to come from the paper mills. The fish seemed to revive when placed in fresh water. Crawfish left the water and refused to go back, thus indicating that some poisonous substance had polluted the stream. The men and boys amused themselves throwing stones and clubs at the dying fish as they came to the surface of the water gasping for breath. It became necessary to notify the police to stop the brutality. It is said that thousands of fish were taken from the water during the day."

It is strange, as well as deplorable, that our health officers are so blind that they cannot see the evil effects that this tainted stream must have upon the community. When a river is so foul that even the fish cannot survive in it, it is surely time to take the matter into consideration.

It will also be observed what a fine sense of distinction is shown between the different methods of brutality. The men and boys who were killing the fish, and thus putting them out of their misery, were ordered to desist; the paper mill managers, who poisoned the stream, were not molested. A fine show of humanity indeed.

CLARENCE VANDIVEER.

MIAMISBURG, O.

Mr. Hallock Visits the Cuviers.

THE Cuvier Club had a very distinguished visitor yesterday afternoon in the person of Mr. Charles Hallock. He is an old friend of President Starbuck, and called on him en route to St. Louis. In addition to Mr. Hallock being a devotee of rod and reel and a noted nimrod, he has a national reputation as a naturalist and a litterateur. He was the founder of FOREST AND STREAM, the leading journal for sportsmen on all topics that relate to the genuine sports in field and on stream. He was also years agone a favorite writer for Harper's Magazine, and has published a number of works which are considered as high authority on the subjects treated. His "Fishing Tourist," "The Salmon Fisher" and "Our Alaska" are some of his productions. The latter work is considered by all who read as one of the most magnificent compositions in the English language. It is really a classic, and so considered by every litterateur who has perused it. That alone was sufficient to give him a niche in the authors' temple. He is now in his seventieth year, and time has dealt kindly with him, for his eye sparkles as of yore and his visage radiant with the bloom of health, and he yet casts his flies with the ease and grace of youth. Mr. Hallock left last evening for St. Louis, where he has a host of friends, who will give the revered sportsman a warm welcome.—Cincinnati Inquirer, Oct. 31.

New Hampshire Spearers Come to Grief.

LACONIA, N. H., Nov. 3.—Seth Filanders, Frank L. Cawley and Harvey M. Sargent, all well-known citizens here, were before Judge Everett in the local police court this morning, each charged with having taken, by spearing, two lake trout in the close season. The respondents all pleaded guilty, and a fine of $25 and costs, amounting to a total of $36.38, was imposed in each case. As a further penalty in each case a fine of $10 was imposed under another section of law, and a sentence of six months in jail was also added, mittimus in the two last penalties mentioned not to issue until called for by the Fish and Game Commissioner. The men settled.

The capture of these three men was effected by State Fish and Game Commissioner Clarke, of Concord, assisted by six deputies, Sunday night. The men were near Governors Island, off the Gilford shore. Commissioner Clarke alleges that the law protecting fish is being ruthlessly violated by many residents about the lake, and that he saw the jacklights of more than twenty-five poachers in the vicinity of Governors Island Sunday night.

He asked the court this morning to impose a severe penalty in these cases, that it might have a restraining effect on other violators of the law.

Another One-Jawed Fish.

Editor Forest and Stream:

Regarding Mr. Guthrie's "Trout That Had a Hard Time," I have the head of an eight-inch *Salmo fontinalis* caught near Clear Pond, Essex county, N. Y., by Goody Clough, then a long-haired mountain boy, but now a prosperous M. D. out Syracuse way. The head is exactly like Mr. Guthrie's. Now, how do these accidents occur? I have never before seen one like my odd little head. These strange things seen in the woods are a sportsman's delight.

PETER FLINT.

Fisherman's Rare Luck.

A remarkable affair is reported from Morehead City which is vouched for by reliable parties here. A fisherman living near Bogue Sound in a small shanty saw a large school of fish go up one of the creeks or blind guts that enter the marshes in that vicinity. He had a quantity of nets on hand and a numerous family, and they all turned out and closed up the mouth of the short creek, capturing the entire school of fish, which were mainly large trout. The lucky fisherman has kept the fish enclosed in the place, taking them out as fast as he could handle them, selling large quantities to the fish dealers at Morehead City. His sales have amounted to $4,000 worth of fish, and several thousand dollars' worth still remain in the pond. The facts were learned from a dealer who came here for additional funds with which to handle the fish for shipment. It is considered one of the most remarkable incidents on record on this part of the coast.—Raleigh (N. C.) Post.

Advanced Ideas in Farming, Trapping and Woodcraft.

Number Two.

UNCLE'S farm comprised about three hundred and fifty acres, "more or less," as the deed's language guardedly declared, and the crops were diversified; Uncle was quite a hand for "rotation" in crops as well as in politics; he even carried this into poultry raising. He would have one breed of fowls for a year or so, and then he would introduce another. Pekin ducks, Langshang turkeys, Plymouth Rock geese, white leghorn pigeons, all followed along in rapid and bewildering procession. At the time of my advent to assume the responsibilities of the position of head push on this farm, that entrancing and graceful breed of chickens known as the Shanghai had the exclusive place of honor in the fowl department. The Shanghai was a sweet and lovable chicken, though rather loud and pronounced in his manner perhaps; I have thought sometimes that nature had originally intended to include this bird among the animals and classify him as a jackass, but having but two legs, and therefore no visible means of support if he wanted to kick with both hind feet at once, there seemed to be nothing left to do but let him go into the chicken class. There was one rooster in this lot big enough to plow with; he was certainly a screamer in every sense of the word. He just walked around that farm as though he was the whole and entire thing. He could eat corn from the head of a barrel without standing on tiptoe; and I believe he could stand beside a barrel full of shelled corn and eat every kernel of it clear to the bottom and then kick the barrel over to see if any had fallen through. Appetite! Well, it was eclipsed by nothing but the size of his voice. That Shanghai's crow could be plainly heard on every part of the farm, and on foggy mornings it was sometimes mistaken for the hoarse whistle of locomotive 360 on the 4:10 freight train, due at that hour at the station three miles distant. One of my advanced ideas was based upon the theory that there was no earthly use in getting up in the morning at the heathenish hours in vogue with farmers generally, anywhere from 1 o'clock to daylight; I claimed that if you work hard enough and with proper intelligence in making the farm hands work twelve or fourteen hours a day there was really no necessity for one getting out of bed the minute there was a streak of light visible in the east. This Shanghai rooster, however, had theories differing from mine; radically different and very obnoxious. In fact, some of this rooster's arbitrary methods were so distasteful that I had about begun to consider some plausible means to compass his destruction—by accident. Still, where was my theory of adaptation? Here was a fowl big enough to haul a load of hay, and voice enough to wake up the Seven Sleepers, kindly provided by nature to fill a big gap somewhere. It was not at all likely that he had been built simply to consume corn and tramp around, stepping on things.

One night I had been lying awake digesting some abstruse question of agriculture, and a big dinner of corned beef and cabbage, the latter perhaps predominating. There are few mental struggles, I think, that are to be compared to corned beef and cabbage, especially if assisted by liberal irrigation with last year's cider. When occasionally sleep did visit my pillow it was disturbed by visions of the Shanghai rooster tramping all over me as I lay on the floor of the old gas house, with Sherlock Holmes stuffing fingers in his ears as the rooster let out one of his yells. It was perfectly natural that I should have Shanghai nightmares, though perhaps it may seem slightly paradoxical. Finally in despair I got up and lighted my pipe, and then an inspiration struck me with great force. I thought at first it was one of the toughs I saw in the gas cellar; but soon got my bearings and began to work out the plans and specifications of a brilliant scheme.

The following day I left the affairs of the farm in charge of the Shanghai, and drove to the city. For several hours after my arrival I was closeted with the best patent attorney in the place. The result was well calculated to revolutionize the entire "signal alarm business in and through," as the application stated, the States and Territories of the United States. And this is it: A phonograph on a large scale was devised, with an electric attachment, and an ingeniously devised cylinder and mechanical connections. The receiver was to be exposed near the Shanghai rooster when he crowed the loudest, and a record made. There was no trouble about the Shanghai making a record. He had already demonstrated his ability to do that; an extra sized megaphone attachment did the rest. We built a machine and took it to the farm and prepared to receive the first impression. In order not to arouse any suspicion on the part of the rooster, we waited until his usual hour for arousing the inhabitants of the county in the morning, and then, when he opened up his vocal accomplishments, we turned the thing loose. We discovered what I had not before observed, that this fowl had seven different kinds of crow—not what you would call exquisitely modulated, but all different, and this was regarded as of immense importance. We could have one series of crows for fire alarm, another for railroad use, still another for marine purposes for foggy weather, or a combination of them arranged for various conditions and requirements.

After securing about fifty records, the chap whom I had taken in as partner, says: "Do you know what we've got? Well, we've got every other kind of alarm beat to a finish, and don't you forget it. I never heard such a noise in my life. A fog whistle simply ain't in it."

I began to think that, after all, old Shanghai had his uses, and my first attempt at adaptation was a good way from being a failure. Well, what happened? A St. Louis or Chicago man who was half crazy over a machine of his own invention for signal alarm purposes, heard of ours, through the Patent Office, and came pell-mell out to see us, bringing his financial backer with him. They came over to the farm one afternoon, and gradually led up to the question which was eating up his vitals. I kept them in a wrought-up condition of mind for an hour or so, and then I brought out the "chanticleer," wound up the mechanism, touched a spring, and off he went. Well, you should have seen those two Chicago men's faces! They were a sight sure enough. The capitalist realized that his money, invested in the other machine, was as good as sunk unless he could acquire mine. So there naturally ensued a season of tactics that was highly amusing. Finally the moneyed man said: "Well, your old crow machine ain't much good; only just a little novelty, that's all; but if you want to take $1,000 for it and throw in the Shanghai we'll think it over."

Of course it isn't every day that you can sell a Shanghai rooster's crow for $1,000; but I concluded there was more money in it to me just them. So I looked surprised and hurt, and then sitting down on the door step I simply laughed for fifteen minutes straight.

"Gentlemen," I finally managed to answer, "your thousand dollars wouldn't buy one of the wing feathers of my little bird, let alone the machine and patent rights."

There ensued the usual amount of backing and filling, proposals and counter proposals, startings off and comings back, and sham battles in various forms, until at last the chaps said $5,000 for the patent and "leave out the blamed old rooster."

As will be surmised, I wanted to get rid of the rooster anyway; so I just fired the last shot and bluffed this offer: "Make it $6,000 and take the whole outfit." And you may call me all kinds of Ananiases if he didn't snap me up quicker than you can say "Scat!"

We went right into the house and drew up the papers. Then we drove to town and the cash was turned over. Perhaps you may have heard of the great Shanghai rooster signal alarm? I haven't, nor yet hide nor hair of the two men or the rooster.

My sleep is tranquil in the morning, except when I get to thinking of what Uncle will say when he comes to miss that Shanghai.

My further opportunities for utilizing the beasts of the field and fowls of the air were soon very much in evidence. I was in great luck within a month after the above interesting experiment in the development of poultry. I am now agitated by conflicting emotions. Dinner is announced, and I more than suspect that corned beef and cabbage or boiled fowl with oyster sauce is on the menu. Kindly excuse me until I ascertain the facts. If it's corned beef and cabbage you'll hear from me next week.

FRANK HEYWOOD.

[TO BE CONTINUED.]

New Publications.

Helps in Photography.*

MR. CHAS. M. TAYLOR, Jr., tells us very pleasantly "Why My Photographs are Bad." His book is intended for beginners, and he hopes that "this volume may aid the ambitious beginner, and enable him to avoid the most common mistakes incident to the first stages of this interesting study."

Mr. Taylor points out the most common mistakes of young photographers, which, notwithstanding they are so obvious, continue to be made. He begins by calling attention to the common error of placing the camera too near the object, and shows the result obtained, by reproducing the photograph of a woman whose head and feet are out of the plate. In posing single figures, one should focus upon the eye of the subject, which will equalize the general effect. In taking a group, focus upon the central figure. He also points out the importance of using diaphrams, or stops, and gives a table for exposures showing the times and stops required for different lights. The titles of some of the chapters are "Foreshortening," "Pictures Out of Focus," "Doubling," or taking two pictures on one side. "Holding the Camera Level" while focusing, and a chapter on "Under and Over Exposed Plates." In that on "Under Exposed Plates," the statement that "haphazard manipulation may succeed in some lines of work, but it is rarely successful in photography," unquestionably contains an element of truth.

Those who belong to the new era in photography are glad to read the statement that "should you make your exposure about the time of the sun's meridian, your results will be more flat and lifeless than if made at another time of the day"; and also "it is very monotonous to the eye to view a landscape flat in color and void of contrast as regards effects in light and shade."

On the other hand, one feels perhaps the lack of artistic feeling when he says that "too much foreground cannot be called a serious defect in a picture, but it is inartistic." There are a great many people who try for this very thing, believing that anything may be regarded as right in photography, provided the result is a beautiful picture. To get this result one must study the effect of light and shade and spacing. To think of every picture primarily as an arrangement, with beauty as the *raison d'être;* this is the desire of the more advanced photographers.

The last part of the book is devoted to specimens of good photography with the detail of lens, time and so on, and a few "Don'ts" for the beginner. We are tired of pamphlets telling us what not to do in photography, from the standpoint of the photographic dealer, and receive with joy a book full of plain truths told in an entertaining way.

Mr. Taylor ends the book happily by saying that "perseverance and vigilance will finally overcome all difficulties, and he who has the patience to continue in his work, will find himself amply rewarded."

Only a Rabbit Hunt.

My sole last season's chance to tramp the fields, hills and woods after game was near the full moon of brown October. As my aged foxhound, Tamarack, who had been the partner of my joys and sorrows afield for ten years, had crossed the divide, I was obliged to borrow a dog. This was a beagle, Spotter, which a week later competed in the N. W. field trials and secured a prize.

It was a typical, warm, smoky Indian summer day. We were ready for the morning train. The hound obtained good quarters in the baggage car, and the baggage master also obtained a good quarter. I understand the railroad magnates intend to charge expressage for dogs, even if accompanied by owners. Well, the former way is the better one for all concerned.

We alighted at North Prairie, where friends made us feel at home. Harry, the chip of the old block, acted as guide. The best hunting ground of the region was among the Kettles, but the tract was posted. Happily, the proprietor of these lands was met. I received an introduction and the permission to hunt on his estate. The first favorable looking territory was not investigated because the possessor, who was husking corn in the field, ordered us out. A spry gray squirrel was the first game seen, but it successfully shunned acquaintance. Near the school house the beagle sniffed tainted air, and music floated through the woodland when the first bunny was blazed at as it scurried onward. Had it been a yard longer the charge would have reached it. The next thing that roared up with noisy flight was a grouse. This, probably, was missed, because a horseshoe that I had just found had not been saved.

Then the pup was missed. I suspected some wood cutters on the knoll of abducting him, but my fears were ill-founded. He developed the provoking defect of occasionally working behind instead of ahead of the hunter. When we got to Hanford's farm we found it very promising, and soon the solitudes were ringing with the quavering cry of the pursuer as he struck the spicy aroma of lepus. My first quarry was an incomer, which was bowled over. Hardly had it been assisted into the game bag when Spotter, signaling with eloquent stern, began another solo. This was Harry's opportunity, but luck favored the rabbit more than the hunter. He escaped into his catacomb, out of which his wagging admirer tried to excavate him.

Then we lunched and enjoyed the woodland scenery painted by the lavish brush of autumn. Oak and maple covered ridges bounded the view. The trees had mostly shed their draperies, and the stained, ripe leaves lay in purple, crimson, gold and wine color at our feet, like a Turkish rug; now and then a single bronze or scarlet leaf fluttered slowly through the unstirred, shimmering, hazy atmosphere. Some gnarled oaks were still robed in leather-colored apparel and the few beeches in yellow livery, but the vermilion dyes of the maples had mostly departed, and only the delicate tracery of their bare branches was left to the gaze. Brown acorns nestled among the fallen foliage, with tawny head, where the cap was detached; while grapevines were sprawling along the ash-gray, dilapidated rail fence near by. The woodsy odor of the amber, dreamy air was mingled with the blue-gray smoke of our cigars, and the kodak was brought into requisition to furnish us mementoes of the glorious times we were having.

I reproved my companion for climbing over fences with a loaded and cocked gun in his hands, but he argued that he had always done so; was now nigh on to seventeen years old, and had never been killed yet. After resuming the chase another partridge with a short "quit, quit," thundered up. I thundered after him, but his eccentric flight twisted him out of the difficulty. The dog, nosing along, opened up again and sang a duet with the echoes among the hills. My chance was coming around on its circuit, when Harry yelled like a fruit peddler, which drove the leveret in another direction, and it was finally lost. The next cottontail was urged along a ridge. I observed him limp daintily forward for about thirty rods, but when he came opposite me, the distance was considered out of range. This was a mistake, for it was less than forty yards.

The next drive I witnessed from a kopje. It was beginning to become dusk. I noticed how the doe stretched herself at full length, in fact, she buried herself in a pile of leaves. Her foe was perhaps twenty rods behind her, imbibing the ravishing perfume of the trail and uttering yells of triumphant delight. Half a minute later the rabbit would, in all probability, steal into a nearby stone pile. I had for my day's labor but one trophy, and, although conscience shrieked, she was swindled out of her life by a pot shot.

In the scramble to gain an advantageous position to bag the next scamperer, my kodak, which had been slung to my back, was lost. It took some time to locate it. My comrade ultimately discovered it dangling on a wire fence. The sun was preparing to bow itself from sight. It was time for me to take the back trail in order to catch the home-bound train. At this juncture another grayback displayed the white feather. I shot behind, but the rabbit shot ahead. The four-footed troubadour trilled merrily along the scent, his jubilant notes growing fainter and fainter. The muffled chimes may have been as sweet as the tinkling of evening bells, or like a vesper hymn, still I did not relish them just then, in fact, the affair cost me my entire vocabulary of imprecations. His white coat at last betrayed the vagrant into the leash.

Twilight had long ago melted into darkness; my train was gone; we were two miles from the station; so, now, we had ample time for the homeward tramp. The full moon flooding the open patches with a mellow light, enabled us to stumble our way out of the gloomy woods over steep mounds and across plowed fields into the village. We had put up nine cottontails that day and had killed all but seven of them.

A very pleasant evening was spent at the residence of Mr. S. A delicious supper, at which oysters and other fats of the land, as well as myself, played a prominent part, was one of the features of the entertainment, which was rounded out by music, cigars and conversation. Harry enthusiastically vouchsafed to have me out of bed before dawn for hunt No. 2. We then compromised to start at six. We got up at 6:45.

The following morning the landscape was clothed in its prettiest. My young confederate hooked one of the horses to one of the buggies, and we, Hess, Harry, myself and Spotter rolled eight miles to the south. A fox squirrel and a hollow tree delayed us under way. The nutcracker saved his scalp. We stabled the nag at Bill Box's quaint old place. Bill is a crony of Harry, and he extended a welcome to me, the stranger.

It was near the winding Mukwonago River, of which we caught glimpses now and then, where our hunting grounds lay. An added advantage was that the tract was also provided with trespass signs, for the presence of Bill secured for us the right to hunt thereon. We started about thirty bunnies in all, of which fifteen were extinguished. Bill is an experienced sportsman and keeps a serviceable hound. I did not care to embarrass dog or master by inquiring into the pedigree of the canine, for the hunting instincts of the half-breed were such as to overlook all shortcomings of his lineage. He had a fair voice, although it was not that weird and melancholy moan so highly valued by huntsmen. He was partly a pointer. He was a long legged, gaunt three-year-old, his ribs stuck out like hoops on a barrel. The grounds were chiefly meadows checkered with bushes, and only here and there sprinkled with alder, elm and aspen groves.

My first booty, driven by the mongrel, was an unaccountable, because it was procured at a distance that I usually do not attempt. Shortly after Spotter howled a gray-fur up to the river. We saw the whole comedy. We perceived the rabbit plunge into the stream, swim it, reach the other shore, and speed up the slope. When the trailer got to the spot where the fugitive had entered the water, he knowingly swam the brook, picked up the scent on the further bank and followed him. A very creditable performance, but the hero of the burlesque disappointed the spectators, because he declined to reappear on the stage.

We then meandered along a beautiful wood road and searched the network of brushland that adjoined it. We combed the thickets pretty thoroughly, and a number of leapers were harvested. Seven or eight woodcock zigzagged out, but none of us made proper connections. Meanwhile that beagle had strayed again. After a while the epicure was detected quietly munching a rabbit that had been killed, but not collected. Another dead cottontail, which was also found, seemed to be quite fresh, but nobody wanted it.

Presently the musicians, forging ahead with waving tails and stimulated by the alluring fragrance of another spoor, commenced another melodious sylvan concert. The undergrowth was very thick. Parting the everlasting twigs before the half-closed eyes, caused some damage to the bridge of my nose. The animal was hustled for a long time. I had changed my position repeatedly, when at last he scudded in my direction, a left quarterer, and the field trial winner twenty yards in the rear. I dropped the leader.

Soon after the pointer-hound pointed a graycoat in a brush pile. Hess mounted the heap, trampled out the occupant and checked his career before any of the others had a chance to touch the trigger. Hess was handicapped somewhat by using black powder.

One grayjacket that had been slightly wounded slipped into a hollow log. Harry pulled it out alive; beside he covered himself with glory that morning shooting his first rabbit in his life, and a running one at that. A remarkable incident of the hunt was that in spite of my partners' carrying cocked breechloaders, there was no accident.

It was now about noon, and we returned to the house. Bill invited us to dinner, but as we had provisions with us, we divided them with the hounds at our wagon.

After lunch we went south into Walworth County. Marshes, half withered, half green, studded with alder coppice and flanked by wooded hillsides, formed the cover. My first conquest was a straightaway, which hobbled along a hay rod. Turning toward the fusilade of the other gunners shortly after, I noticed a "partridge" whizzing toward me like a feathered baseball. I missed twice, which proves that I had no pump gun. Five cartridges had been expended, but he sailed away with flying colors. He was marked down on a hilltop, but was not retrieved.

Then the beagle, after a few whimperings, rendered a recitation as he inhaled the intoxicating redolence of a fresh track. My colleagues did not care to wait, and, as the soloist could be heard no longer, they were sure that he could not unravel the trail. But as I knew his stanchness, I made up my mind to tarry a while. In about fifteen minutes he hurried the runaway back from the oak ridge to the starting point. I pocketed the whitetail and hastened after the others.

A woodcock was flushed by one of the party. I secured it in sportsman's style and was glad to add its russet and velvet plumage to my collection. A young man, who accompanied the crowd with a Flobert rifle to accumulate some squirrels if possible, also realized a rabbit. Bill had espied one sitting in a little hollow. He motioned up the young fellow and showed him the crouching victim, which was picked through the head at less than ten paces.

In the meantime that wayward beagle was vagabondizing again. We had not seen him for two hours. As I had either to return the creature or forfeit his price, $35, I trudged back to look for him. A half hour's search revealed him afar off, across the marsh, trailing my footsteps. When I had again overtaken the party, which had once more drifted to the morning's grounds, it was time to prepare for our departure. While the rest had amused themselves with firing at tomato cans hurled into space, Bill had sneaked to the river and had pulled down a plump wood duck just as it skittered down stream. He had also bagged a snipe. At his home we were entertained by a pitcher of wine, which our host had unearthed from his cellar.

The homeward ride was a treat. The moon's silvery disk, a fleet horse, smooth roads, an old pipe, a damp, lazy autumn evening, agreeable company, a dozen rabbits and a woodcock in the game coat were the ingredients. The only unpleasant element of the trip was its end.

T. Le Trab.

Milwaukee, Wis.

Another Dog Hero.

Editor Forest and Stream:

As I have given the readers of Forest and Stream the history of two dogs from Idaho, I now ask your further indulgence in giving the history of one of the most noble dogs that has ever come under my notice, and his performance should be inscribed in letters of gold upon the scroll of Fame. I think that few dogs are worthy of being placed ahead of this one.

His appearance indicated that hound was the larger part of his pedigree. I think there was some Newfoundland in his make-up from his size and disposition. He was owned by Mr. and Mrs. Lowrey, of Republic, Washington, who kept the Montana House, and as the dog was used to being petted by lots of people, he was very affectionate.

Mr. and Mrs. Lowrey not having any children, of course the dog was a great favorite with them, and wherever either went the dog was their companion. Along in the winter two years ago Mr. Lowrey had to go to Sheridan Camp on some business, and the dog went along. While they were at camp there a very severe snowstorm came up, and it was very cold. Mr. Lowrey started to return to Republic against the advice of his friends, who wanted him to stay till the storm was over. But he would not stay, and he and his faithful companion started on what proved to be the last trip of Mr. Lowrey, and came near terminating the earthly career of his noble dog.

After traveling for a while he lost the trail, and wandered off to the left of the trail, and when he reached within about two miles of the Tom Thumb Mine he became exhausted, and lay down near the roots of an upturned pine tree, there to take that last sleep that knows no awakening. The storm proved to be a very severe one, and it was a week before any one passed between the camps. Mrs. Lowrey thought Mr. Lowrey was in Sheridan Camp, and those in camp thought he had reached home. As soon as it was known that he was lost, quite a large crowd started out to hunt for the man and dog.

Some miners near the Tom Thumb mine had heard a dog howling over across Granite Creek, but had attached no importance to it till they heard that Mr. Lowrey had been lost; then they went over in the direction whence they thought the howling proceeded, and soon they came across a sight that brought tears to the eyes of those sturdy old miners. There lay Mr. Lowrey in the cold embrace of death, and there was his poor dog nothing but a living skeleton, standing watch over that master, he would die before he would desert him, and would starve before he would despoil him. There were tracks of coyotes in the snow where they had come near and had been chased away, and the magpies were not allowed to light near, and when the miners approached he would not allow any of them to come near; but he was so weak that he was easily overpowered, and when they placed the remains of his dead master on the sled the dog was too weak to walk and was placed by the side of the one he had so faithfully stayed by for nine days, without food or water, on what snow he must have eaten.

What a sad home-coming it was to that poor woman, as well as it was to that faithful dog, who acted as if he would like to tell his mistress how he had watched over his master, waiting for him to awaken and return home. It was only with the most tender care that the dog was nursed back to health, and for a long time after his master had been buried he would moan and cry out as though his heart would break. Not long after, Mrs. Lowrey moved to Butte, Mont., accompanied by one of the most faithful dogs that was ever met by

Lew Wilmot.

Keiler, Wash.

"A Vermont Mode."

Editor Forest and Stream:

For the benefit of your Philadelphia correspondent, Mr. Albert Converse, who criticizes a "Vermont Mode" in your issue of this week, I beg to call attention to the note on Arkansas fox hunting on page 372 of the same number. From what Mr. Loudon there says, it appears that to shoot a fox before the hounds is an approved Arkansas mode. And as Arkansas took its shooting ethics from Davy Crockett, I assume that what is *à la mode* there must be followed by the rest of us; though as Mr. President Harrison once remarked, "Many things are done on the Kaw that don't go in Washington."

Now, as to digging out a fox that had been run to earth, while I should not like to do that, I confess that I can see mighty little difference between that and the English fox hunting practice of sending out a man beforehand to stop up the entrances to the holes to which it is thought the pursued fox will run for refuge from the hounds. There may be a difference between stopping up a hole so that the fox cannot get into it and digging him out after he has got into it, but I cannot see the distinction. To me it means just the same for the fox. I've

been on earth fifty-odd years, but I'm not too old to learn, and if Mr. Converse thinks it worth while to add to my education in this little matter, I trust that you second my invitation to him to do so. J. H. MONSON.

Points and Flushes.

On Wednesday and Thursday of this week, the Western Massachusetts Fox Club will hold its fifteenth annual hunt at Westfield. The annual club dinner will be served to members and guests at 6:30 on the evening of the first day's hunt.

Yachting.

For Cruising Yachtsmen.

WITH the purpose of stimulating the interest in cruising, and the keeping of a detailed log by cruising yachtsmen during the season of 1902, the publishers of FOREST AND STREAM offer prizes for the best stories of cruises submitted to be published in FOREST AND STREAM. It is believed that these will form not only entertaining records of pleasant summer days spent afloat along our coasts and waterways, but will furnish information of practical value to other yachtsmen making subsequent cruises on the same waters.

Prizes will be awarded to the three best stories as follows:

First prize, $50.00.
Second prize, $30.00.
Third prize, $20.00.

Contributions are invited under the following conditions:

1. The cruise must be made in waters of the United States or Canada in the season of 1902.

2. The cruise must be made in a sailing yacht, power to be used only as an auxiliary, if at all.

3. The story must be prefaced by a description of the boat. Cruises should be treated in as interesting and readable a way as possible, but should be practical and contain all possible information and data that would be of value to men going over the same route. A description of the handling of the ship in all weathers will be regarded very favorably in making awards, and it is suggested to writers that an accurate account be kept of all incidents happening while under way.

4. An outline chart suitable for reproduction, showing the course taken, must accompany each article. When possible, articles should be accompanied by amateur photographs taken on the cruise, including one of the boat. Good photographs will be considered in making the awards.

5. The story should contain about seven thousand words, written on one side of the paper only, and must be received at the office of the Forest and Stream Publishing Company, 346 Broadway, New York city, on or before Nov. 15, 1902.

Mr. T. C. Zerega has very kindly consented to act as judge and to make the awards.

High Speed Steam Yacht.

THE plans of the 77ft. high-speed steam yacht reproduced in this issue are from the board of Mr. Fred D. Lawley, of the Geo. Lawley & Son Corp., of South Boston, Mass. The boat presents a very smart and graceful appearance, and though of narrow beam, her accommodations are fairly roomy and far more so than is usual in craft of this popular type.

The dimensions follow:

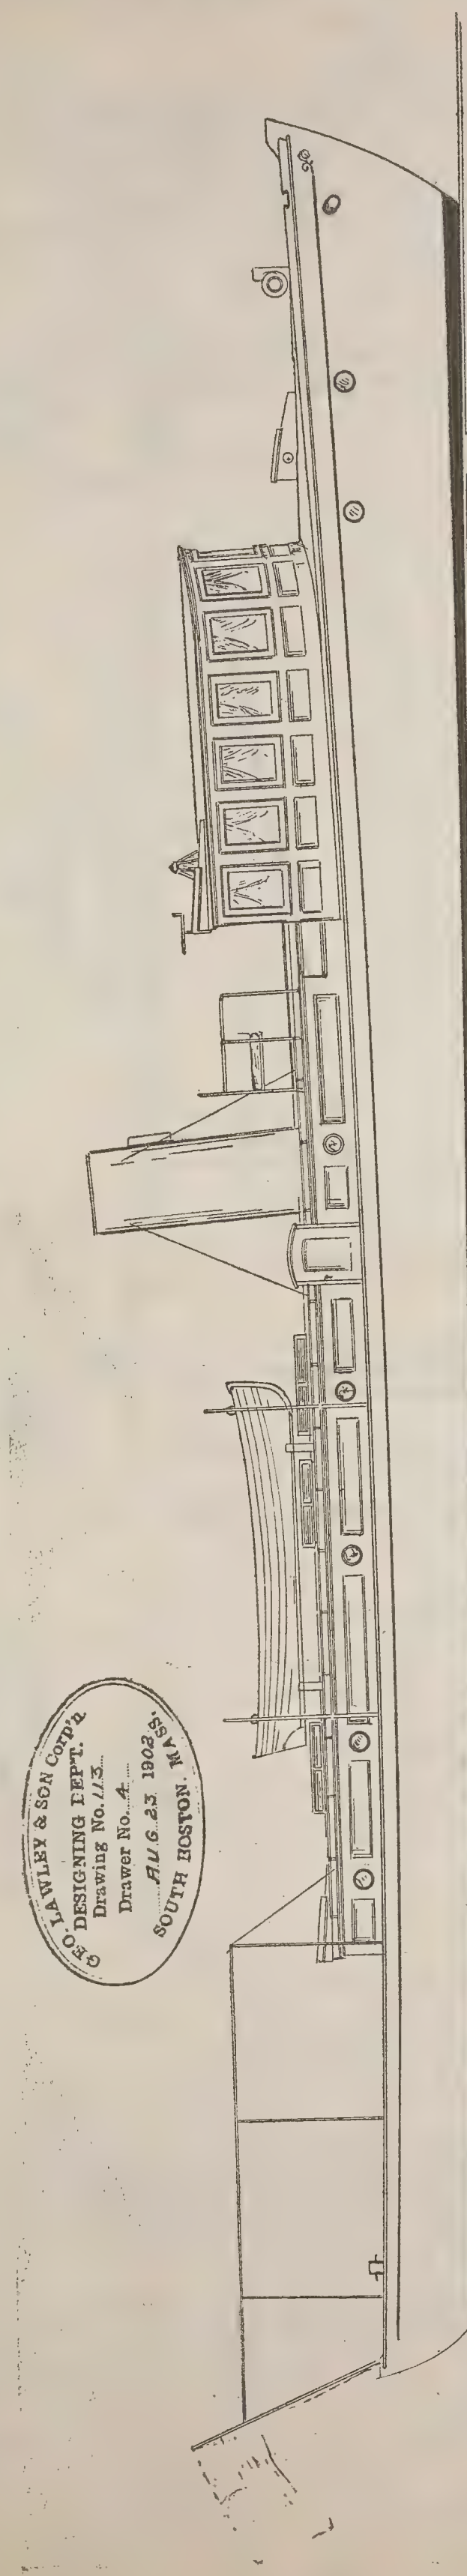
Length—	
Over all	76ft. 6in.
L.W.L.	71ft. 0in.
Overhang—	
Forward	3ft. 0in.
Aft	2ft. 6in.
Breadth—Extreme	12ft. 6in.
Draft—Extreme	4ft. 0in.
Freeboard—	
Forward	6ft. 0in.
Least	3ft. 2in.
Aft	3ft. 6in.

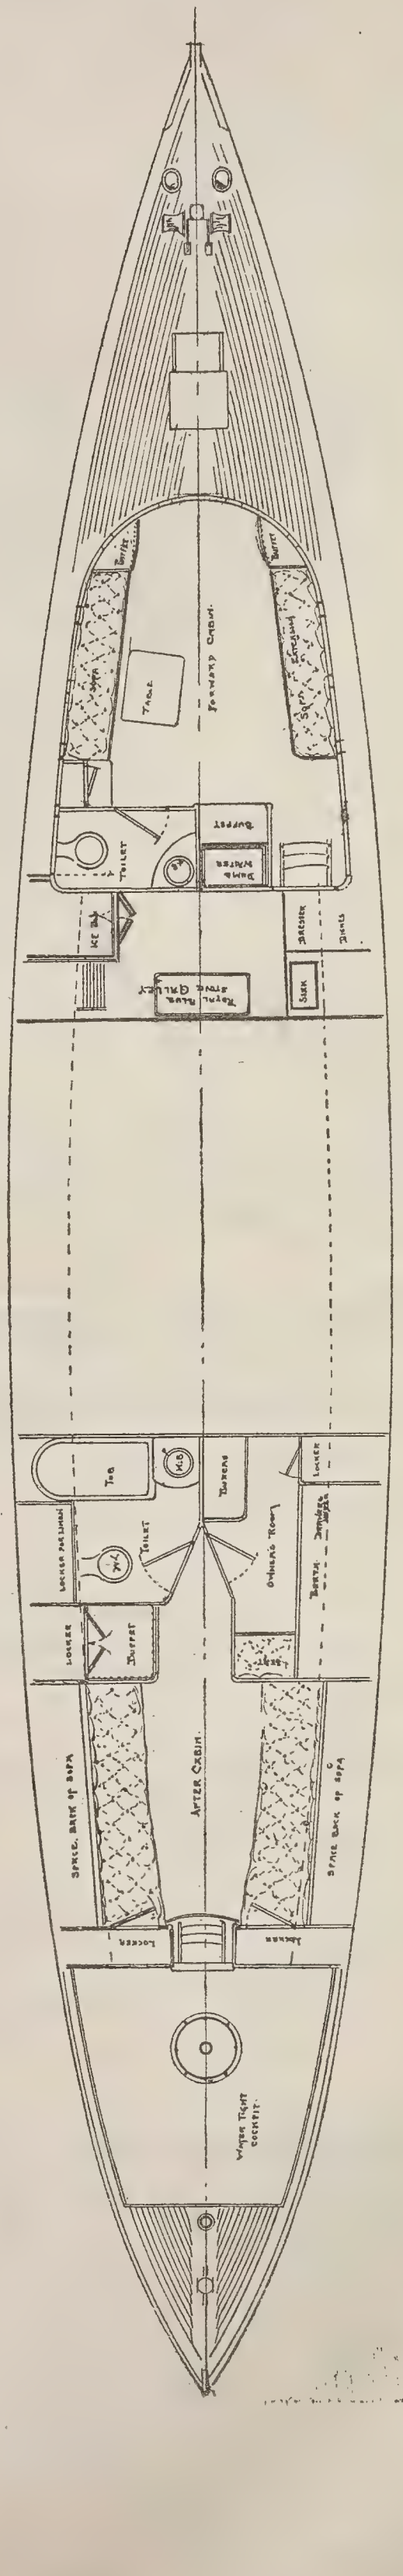
There is a roomy cabin in the forward house, which is 5ft. high, 13ft. long and 10ft. wide. On each side there is a transom and forward of these are sideboards. In the after end is a dumb waiter, which leads to the galley below and a toilet room fitted with a set marble basin and patent closet.

The low cabin house is 35ft. long and 2ft. high. In the forward end of this, just aft of the forward house, is the galley which is 4ft. long and runs the full width of the boat. The boat is steered from a bridge on the low house just over the galley. Aft of the galley is the machinery and boiler space. This takes up 13ft. 6in. Aft of the machinery space on the starboard side is a stateroom 8ft. long. There is a good berth, transom bureau and locker. Just opposite on the port hand is the bath room, 5ft. 6in. long. The tub is of porcelain, and there is a marble wash basin and water closet. Aft is the main saloon, 12ft. long, which leads to a roomy cockpit 8ft. long.

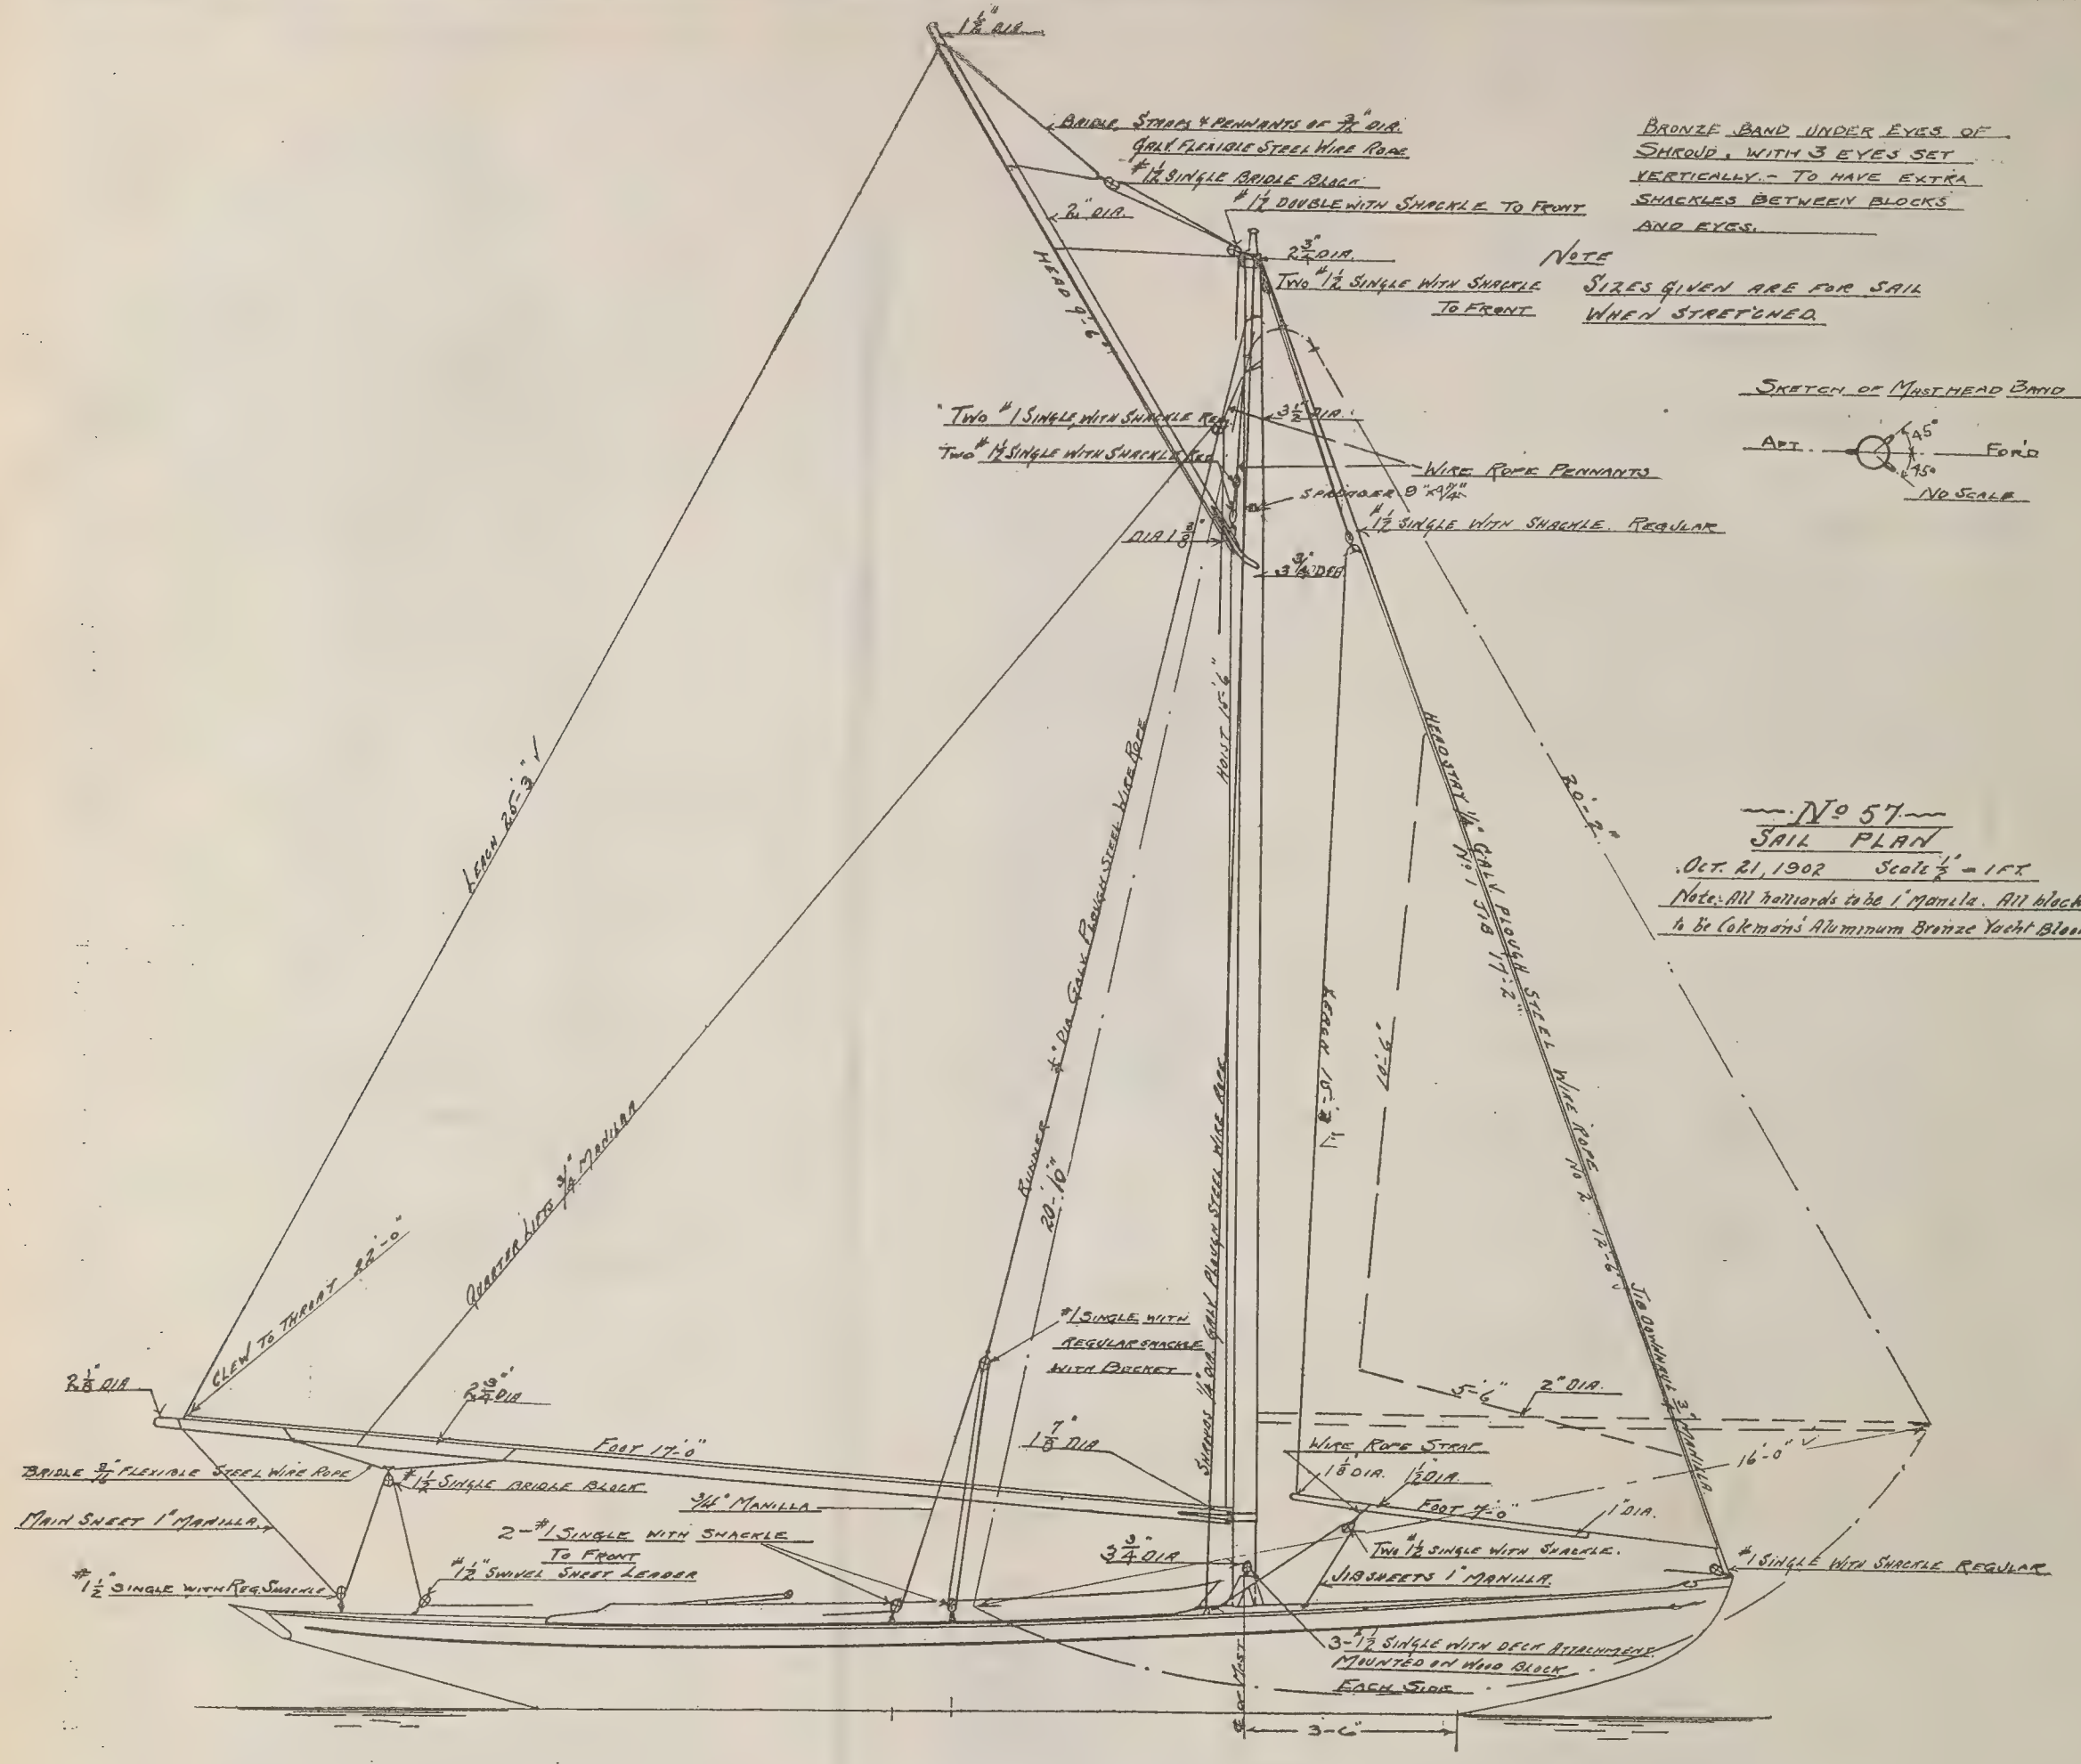
Forward there is a roomy forecastle with room for four men. A 13ft. boat is swung on the davits.

At Jacob's yard, City Island, work is progressing on the new schooner of Wintringham design, and the keel will soon be laid. Laid up for the winter at this yard are many of the large and noteworthy boats, and they form a most interesting study. Among them are Vigilant and Ailsa, side by side; the three 70-footers, Yankee, Mineola and Virginia; schooners Emerald and Amorita; cutters Neola, Queen Mab and the fast steam launch Scud, beside many other boats large and small, and of all sorts and kinds. Mr. Jacob is preparing for a very busy season and expects to have the yard filled with work.





OUTBOARD PROFILE AND CABIN PLAN OF 77-FOOT HIGH SPEED STEAM YACHT.—DESIGNED BY FRED D. LAWLEY AND BUILT BY THE GEO. LAWLEY & SON CORP., 1902.



— No 57 —
SAIL PLAN
Oct. 21, 1902 Scale ½" = 1 FT.
Note: All halliards to be 1" manila. All blocks to be Cokmon's Aluminum Bronze Yacht Blocks.

— No 57 —
— DECK PLAN —
Oct 25, 1902 SCALE, ¾ IN. = 1 FT.

SEAWANHAKA FIFTEEN-FOOTER—DECK PLAN.

Seawanhaka Fifteen-Footer.

THE Seawanhaka Corinthian Y. C. has again directed its efforts toward establishing a one-design class for racing at Oyster Bay, and the boats, which are now well under way, promise to form the largest and as fine a class of small one-design boats as can be found on Long Island Sound as seventeen boats have already been ordered, and there is all probability that more will be added to this list. It will be remembered that when the idea of establishing this class was first formed, a competition for designs for a boat of 15ft. racing length under measurement rule formulated by Mr. Hyslop was conducted through the columns of FOREST AND STREAM, and liberal prizes offered for the best designs. This competition was successful in bringing out a number of good designs, but it was found that what was considered a desirable type of small boat could not be produced under the rule in force, so these designs were laid aside and Mr. Clinton H. Crane was commissioned to get up plans for a boat of 15ft. waterline without regard to the rule, the chief requirements being that the boat should be able and seaworthy, fast in all weathers and of handsome appearance. The result of Mr. Crane's work is shown by the plans which are here reproduced, and it will be seen from them that the design is practically that of a 21ft. raceabout reduced to 15ft. waterline. The dimensions of the boats are as follows:

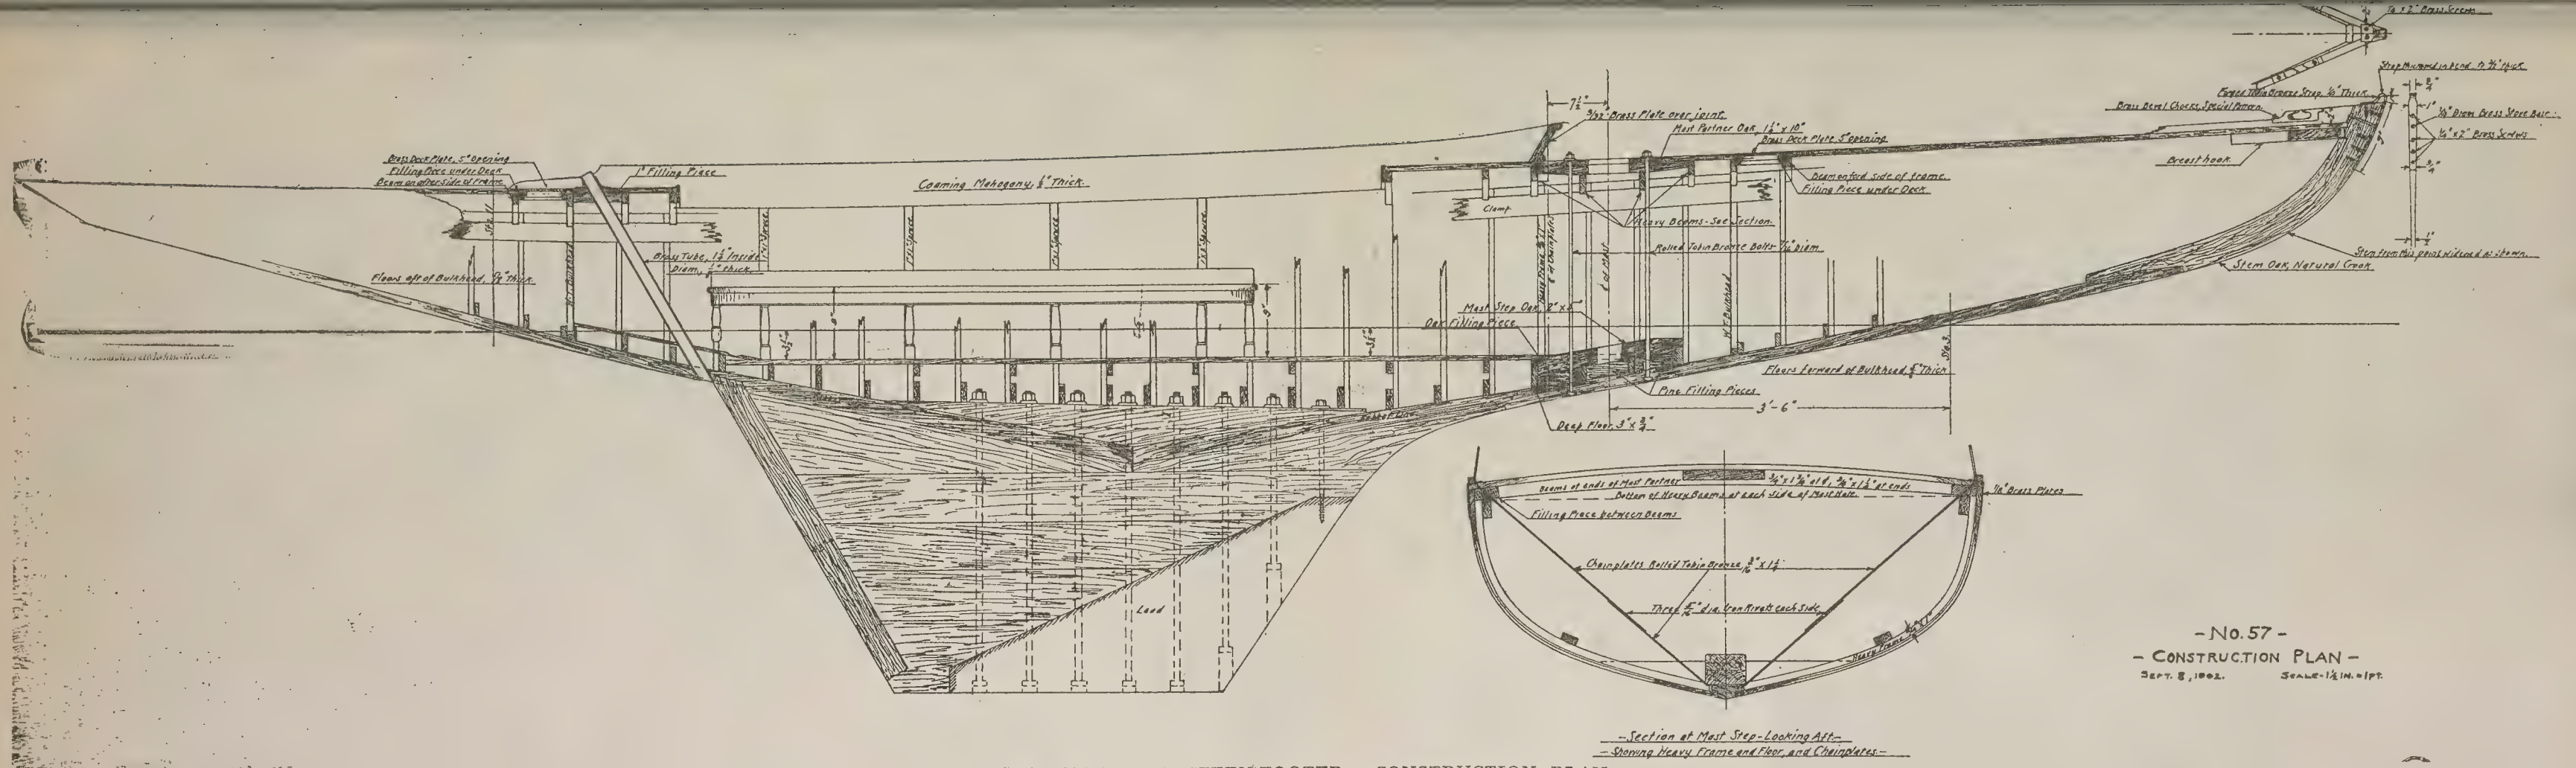
Length—	
Over all	24ft. 5in.
Waterline	15ft. 0in.
Overhang—	
Bow	4ft. 5in.
Stern	5ft. 0in.
Breadth—	
Extreme	6ft. 2in.
Waterline	5ft. 6in.
Freeboard—	
Bow	2ft. 1in.
Stern	1ft. 7in.
Least	1ft. 3in.
Draft—Extreme	3ft. 9in.
Sail area	290 sq. ft.
Lead keel, about	1,100lbs.

No attempt has been made to turn out a cheaply constructed boat, as the specifications call for the very best materials and workmanship in every particular. The hulls will be double planked, 3-16in. cedar being used for the inner skin, and 3/8in. mahogany for the outer, with cotton cloth between laid in varnish. The planking is copper riveted to the frames and all other fastenings are of copper or composition. The decks are of white pine covered with canvas and painted with the exception of the planksheers, which are left bright. Water tight bronze bulkheads, both forward and aft, insure the boats being absolutely non-sinkable. The sail plan is small and the rigging simple, so that the boats will be easily handled.

The contract for building the boats was awarded to Samuel Ayers & Son, of Nyack, N. Y., who already have one boat so nearly finished that she will be given a trial very shortly.

At a meeting of the owners recently held at the club's city quarters, the boats were assigned as follows:

No. 1. Charles W. Wetmore.
No. 2. Daniel Bacon.
No. 3. Major H. H. Landon.



Coaming Mahogany, ¼" Thick.
Floors aft of Bulkhead, ⅞" Thick.
Floors forward of Bulkhead, ⅝" Thick.
Mast Step Oak, 2" x 8"
Oak Filling Piece
Pine Filling Pieces
3'-6"
Deep Floor, 3" x ⅜"
Lead
Clamp
Breast hook
Stem Oak, Natural Crook.
Filling Piece under Deck
Rolled Tobin Bronze Bolts, ⅞" diam.
Chainplates Rolled Tobin Bronze ⅜" x 14"
Three ⅝" d.h. Iron Rivets each side
Waterways
¾" Brass Plates
Filling Piece between Beams
Bottom of Keson Beam 4" each side of Mast Hole
Beams at ends of Mast Partner
Mast Partner Oak, 1½" x 10"
Brass Deck Plate, 5" opening
Filling Piece under Deck
Beam notched Side of Frame
Keson Beams - See Section
Brass Bevel Chocks, Special Pattern
Brass Deck Plate, 5" opening
Filling Piece under Deck
Beam at Side of Frame

Manhasset Bay Winter Club.

NEW YORK, Oct. 28.—The Manhasset Bay Winter Club has been organized within the club, its object being to keep our members in close touch with club matters during the winter months, and make the club house an objective point, not only for members living within driving distance, but also for those living in the city, who appreciate the pleasure had from a trip into the country on a pleasant winter's day, and the added enjoyment to be derived from communing with fellow yachting cranks on the many debatable points of the sport.

The sole qualification for membership, is that each member shall pledge himself to visit the club house at least two Sundays during each month from November to April inclusive, or failing so to do, pay a fine. The aggregate amount so collected will be disposed of as may be later decided.

Arrangements will be made to keep the house warm, and Capt. Bird will serve dinner each Sunday at 1 o'clock P. M.

E. M. MACLELLAN, Sec'y.

YACHT CLUB NOTES.

The Seawanhaka Corinthian Y. C.'s House Committee announce that the club's city quarters in "The Mansfield," at 12 West Forty-fourth street, are now ready for occupancy, and from the Secretary comes notice of the fifth regular meeting of the club for the year 1902, which will be held on Tuesday, Nov. 11, in these rooms. Various amendments to the by-laws will be acted upon and after the meeting supper will be served.

* * *

The Indian Harbor Y. C. has had plans prepared for enlarging its club house at Greenwich to nearly double its present size. It is proposed to move the present house about a hundred feet to the northward and to build a four-story addition on the eastern side, thus enlarging the ball room, dining rooms and kitchen, and providing five extra rooms. Local contractors are now figuring on the work, which it is estimated will cost in the neighborhood of $25,000.

YACHTING NEWS NOTES.

Mr. Frank M. Smith, of the N. Y. Y. C., has recently closed a contract with the John R. Robins Company, of South Brooklyn, for a new steam yacht, 211ft. long, from designs by Mr. Henry J. Gielow, to take the place of Hauoli, whose plans were given in a recent issue of FOREST AND STREAM. Hauoli, though satisfactory in every way, was found to be a trifle too small to meet Mr. Smith's requirements, so the order was given for a larger boat of the following dimensions: Length over all, 211ft. 3in.; length waterline, 166ft.; breadth, 21ft. 6in.; draft, 9ft. She will be built of steel throughout, and will have five water-tight bulkheads. The outboard profile shows a schooner rig with two pole masts, and two deck houses, the forward one being about 60ft. and the after one 40ft. in length. The yacht has no pilot house and is steered from the bridge on top of the forward deck house. The owner's accommodations are well arranged in the two deck houses and below deck aft, while the space below deck forward of the machinery is given up to officers' and crew's quarters and storerooms. The yacht will be very handsomely and completely furnished and is to be ready for delivery by June 1, 1903.

* * *

Sir Christopher Furniss' new turbine steam yacht Emerald, recently launched from the yard of Messrs. Alexander Stephen & Son, Linthouse, Glasgow, is described as follows by the London Field: "The new yacht, which has been built to designs by Mr. F. J. Stephen, is a vessel of very handsome appearance, no extent of accommodation having been sacrificed to obtain speed. The intention of the designer is to reach a speed of sixteen knots, with an entire absence of vibration and an exceptionally low coal consumption. Dimensions: Length over all, 236ft.; breadth, 28ft. 8in.; moulded depth, 18ft. 6in. The vessel has three sets of turbine engines, three shafts and five manganese bronze propellers—one propeller on the center shaft and two each on the side shafts. The hull has been specially strengthened to prevent any vibration in the structure, owing to the great speed at which the shafts revolve. In the engine room, beside the three turbines, with their condensers and the duplicate electric lighting machinery, there are a large number of auxiliary engines of all kinds. The main boiler is of very large diameter."

A. C. A. Sugar Island.

BROOKLYN, N. Y., Nov. 5.—Any member of the American Canoe Association desiring one or more copies of the blue print map of Sugar Island, can obtain same by sending to Robert J. Wilkin, President Board of Governors, A. C. A., P. O. Box 97, Brooklyn, N. Y., and inclosing fifty cents for each map desired.

ROBERT J. WILKIN.

Cold Comfort.

From the Waterbury.

Nervous Gentleman (who has engaged individual to act as guide)—But, my good man, are you sure you have taken the right road?

The Individual (gruffly)—I know I has; we are now close to the "Bloody Gulch," where a man's skelington was found last summer with bullet holes in the skull. They tried fix the murder on me, but (with a grin of great satisfaction) they couldn't prove nothin'. No; they couldn't prove nothin'!

The great python serpent of the Paris Jardin des Plantes has just died after fasting for two years, five months and three days. This finely marked python came from Japan. It was 21 feet long, in prime condition and extremely lively when it arrived, but refused all food. It was offered a Dahomey sheep, rabbits, geese, ducks, fowl. It would occasionally strangle the animals or birds placed in its cage, but under no circumstances would it eat them. The python took a bath from time to time. At length it lost weight and strength, and its scales turned a dull gray. Toward the beginning of this year it became extremely lean, and remained curled up in a corner of its cage, and quite harmless. Its keepers compelled it to swallow eggs, but the food apparently was undigested. The body was covered with ugly sores and the scales came off. The different organs of the serpent became inert one after another. Its weight when it came from Japan was 165 pounds; at the time of its death it weighed 60 pounds. Its loss of weight was thus 66 per cent., a larger proportion than has ever been observed hitherto in any animal.—London Daily News.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Rifle Range and Gallery.

The Function of a Telescopic Sight.

FROM inquiries and conversations which the writer has carried on with many eminent shooters and experts, it would appear that the precise function of telescopic sights is not as a rule well understood. The difficulty arises from the fact that telescopes serve very different purposes, according to the class of rifle on which they are used; and the mistakes which have arisen can be traced to the practice of arguing by analogy, leading to assumptions that the conditions which apply to one kind of work are common to all. The shooter who has a telescope on a rook rifle or a .22 rim-fire weapon finds certain improvements in accuracy and alignment which he assumes will be proportionately reproduced not only when firing at deer-stalking distances, but also at 1,000yds. on the range. The need for sharpshooting in military operations has afforded a useful fillip in the development of telescopes having the necessary mechanical soundness for standing the wear and tear due to the recoil.

If we start with the humblest instance of all, viz., a shooter who uses a .22cal. rifle for rabbits, not because he finds rim-fire ammunition as good as the more expensive varieties, but because of the reduced noise, we find that the function of the telescope works in the direction of increasing accuracy of alignment and pull-off. This is effected because of the optical advantages that arise when the sighting device and the object aimed at are both in one focus. An additional but more gradually operating cause of accurate alignment with telescopes is that the apparent movement of the rifle due to the natural motions of the body is increased in proportion to the magnifying power, and the shooter has therefore an extra inducement to control unsteadiness that would be barely apparent with ordinary sights. It is astonishing how quickly the muscles and nerves learn to obey the teachings of the brain, for at the end of a very few days the movements are reduced, so as to seem about the same as those which are experienced with ordinary sights. At the short distance at which sporting telescopes are used they are clearly not of much service for finding game. Admittedly, they enable one to pick out the details of an animal's anatomy, so that the shooter is more clearly assured that he is aiming at the center of an animal's head when he has the cross-hairs nicely placed thereon than he would be were he aiming over the ordinary foresight, or even through a hollow bead. This facility for picking out the details of a small animal is most marked when the destined quarry is partially obscured by intermediate foliage or vegetation.

In the case of deer-stalking, very much the same kind of influences are at work to increase the effectiveness of the shooting, though in this instance mention must necessarily be made of the great value of a telescope for correcting those defects of vision which would make ordinary sights difficult to use, even with the aid of spectacles. In deer stalking, however, especially at the longer distances, the power of picking out one's beast is a material advantage, because it may frequently happen that only so much of the body is visible as will lend itself to telescopic sighting when ordinary sights would be at a disadvantage. Doubtless the modern telescope is seen to its greatest advantage when applied to deer stalking rifles, because the cost of this kind of shooting, and the high quality of the weapons used, enable the finest glasses to be chosen, the cost of which is not disproportionate to the benefits gained. It is almost impossible to get a really high class telescope with properly achromatized lenses for less than about 7 guineas before fitting. The subsequent adjustment of the telescope to the rifle, so that the hairs shall be in strict agreement with the barrels, is by no means a cheap piece of work. In fact, while on this subject, it would be well to point out that the efficiency of many telescopic rifles is sadly marred by the impossibility of correcting various little defects of adjustment which are liable to develop in use. In all these rifles used for short-range work the adjustments for range should be effected by the raising of the cross-hairs within the telescope, the flatness of trajectory over sporting distances enabling a very moderate elevation of the hairs to do all that is necessary to correct the effect of the bullet's fall. It would seem reasonable to expect that the two hairs should be separately mounted, so that a so-called wind allowance could be effected by the separate movement of the vertical hair. Of course, it would be immaterial whether the cross-hairs are independently mounted, the one with vertical and the other with horizontal power of adjustment, or whether the disk carrying the two hairs be movable bodily in the two directions. In either case it would be possible, with a fixed mounting between telescope and barrel, for the sportsman to insure in advance that the bullets are flying truly with his own particular method of pull-off and firing.

In summarizing the effects of telescopes when used for sporting purposes, it will be seen that their function is almost exclusively limited to improving the accuracy of alignment. With telescopic sights fitted to target rifles for shooting at long ranges this advantage no longer exists. With a well adjusted pair of match sights the shooter can hold on to his bull so that the amount of error is little more than 3in. at 1,000yds. A telescope may do better in theory, but in practice it cannot, and if it could, the advantage would be immaterial. The difficulties of giving absolute adjustment in degrees, of maintaining the axis of the lenses in conformity with the markings on the scale, and of protecting the elevation of the glass from disturbance by the recoil, prove that match sights are more perfect as aligning instruments that the best telescopic sights that have ever been made, this, of course, applying only to shooting at long ranges. There is another source of wrong alignment with telescopes, which is known as parallactic error, viz., that due to variable position of the eye in reference to the eyepiece, a fault that may be in excess when there is a large field of view. That this error may be a serious one can be demonstrated by any one who will fix a telescope sight on a tripod. It will be seen that the position of the cross-hairs in relation to the background varies according to whether the eye is looking through the center of the eyepiece, or from a point near the edges of it. When the various errors and losses of adjustment of even the best telescopes are borne in mind, it will be seen that they have points of inferiority when compared with match sights, which are solidly fitted to the rifle, and whose adjustments remain intact after years of use.

The question then arising is as to the use of telescopic sights at all when they are shown to be incapable of improving on match sights as instruments of precise alignment. The answer to this query is that, while the ordinary aperture back sight and hollow bead foresight can be perfectly held on a black bull on a white ground, the strain on the eye is too great to allow for using them against obscure backgrounds, where the point to aim at is hardly distinguishable from its surroundings. For military purposes it is necessary to be able to aim a rifle at some particular portion of a piece of country where the distinguishing marks are few. In the case of men, for instance, who may be only occasionally in evidence when viewed through a glass, it is extremely difficult to find with the naked eye the precise spot at which to aim, and even more difficult to get satisfactory alignment thereon. With the telescope, however, the finding and shooting are both effected while the rifle is at the shoulder, and, however small the actual mark fired at may be, the alignment is perfect by comparison with the errors that must occur in range estimation and deflection due to wind. At the ordinary long-range target the match sights must remain pre-eminent, but if the target is indistinguishable with the bare eyes the telescope can still afford very nearly as perfect alignment as though the target were of regulation pattern. There can never be any likelihood of picking off small marks at long ranges. All that can be expected is that the bullets shall be scattered around a spot known to be occupied, the actual hitting and moral effect to be left to the law of averages working in combination with rapid fire. It is in this light alone that the use of telescopes for long ranges should be regarded.—Field (London).

Columbia Pistol and Rifle Club.

SAN FRANCISCO, Oct. 19.—The Columbia Pistol and Rifle Club's scores, made to-day, on the Columbia target, off-hand shooting, 200yd. range, follow:

Rifle match, 10 shots: Mannel 53, 64, 66, 68, 71; Young 60, 64; Hovey 69, 75, 83, 84, 86, 97; H. Hinkel 72, 73, 75, 76, 93.

Three-shot match: Mannel 14, 14, 15; Hovey 17, 18; Young 20.

Military and repeating rifle, Creedmoor count: Twist 44, 37, 35; Hunsaker 44, 44; Pape 44; H. Kroeckel 45, 44, 43, 43, 43, 42; Knostman 42, 42, 42, 41.

Fifty-yard range, pistol: Brannagan 35, 39, 40, 40, 42, 44, 44, 45, 45, 47, 48; Barley 46; Young 46, 50; L. Hinkel 58, 57; Twist 61, 63, 72; Mrs. Mannel 62, 62, 66, 67, 67, 69; Hunsaker 65, 67, 78; Gimmel 67, 69; Mrs. Waltham 67, 79; Knostman 59, 63, 71, 77, 79, 81, 81 85, 87; Allen 89, 91, 99; Trego, revolver, 80, 82, 82, 83; Scott 94.

Revolver: L. Hinkel 38, 45; S. Carr 78.

.22 and .25 rifle: Young 17, 21, 26; Daiss 19, 26, 29; Kroeckel 22, 22, 23; Hunsaker 24, 26; Gimmel 27.

Nov. 2.—Rifle, 10 shots: Hovey 60, 71, 79, 88, 94; Mannel 61, 65, 67; Hinkel 66, 91; Kroeckel 68, 69, 87, 94.

Three-shot match: Mannel 13, 15, 16, 18.

Military and repeating rifles, Creedmoor count: Twist 46, 44, 44, 43, 43, 42; Kroeckel 46, 45, 45, 45, 43; Becker 45, 45, 43; H. Hinkel 45, 42; Hoadley 44, 46; Burry 44; Pape 44; Knostman 42, 41.

Fifty-yard range, pistol: Brannagan (tied the club and coast clean target record and took the lead from Young for 10 best scores of year) 30, 38, 42, 44, 45, 48; Dr. Hunsaker (beat his own record) 35, 47, 60, 66, 67; Young 40, 45, 47, 48; L. Hinkel 52, 67; Knostman 58, 69, 72, 76, 76, 80, 82, 80, 83, 86, 94, 95; Mrs. Mannel 66, Allen 72, 77, 79, 86, 87, 95, 95; Barry 66; Mannel 77; Mrs. Waltham 93.

Revolver: L. Hinkel 44, Brannagan 45, 45, 47, 57; Trego 82, 86, 78.

.22 and .25 rifle: Kroeckel 17, 20, 21, 22, 23, 25; Young 18, 21, 22, 24, 26, 26; Daiss 19, 19, 20, 21; Mrs. Mannel 30, 36, 37, 46; Twist 30, 35.

L. Hinkel forged ahead of Brannagan in the revolver total of ten best scores. Great interest in manifested in the matches. Oct. 19, Mr. Kicker, of Out-Door Life, and president and secretary of Stockton Woolen Mills Rifle and Pistol Club, were present. The Stockton Pistol and Rifle Club's fine 50yd. range was burned in the big fire.

FRED. O. YOUNG, Sec'y.

Ossining Gun Club.

OSSINING, N. Y., Nov. 7.—The following scores were made at the rifle gallery of the Ossining Gun Club, distance 50ft.; target ¼in., 25-ring: Seth Herenden 232, 233, 241; C. G. Blandford 238, 235, 232, 230, 228, 239; Miss Frances Gibson 228, 213, 217, 222; Dr. E. B. Sherwood 233, 234, 235, 232, 231; F. Tompkins 234, 236; C. H. Sidman 236, 235, 232, 238, 239; D. Brandreth 232, 240; E. F. Ball 240, 235, 230; W. H. Coleman 235, 230; G. Tompkins 234, 233; Amos Bedell 234, 229, 237; Wm. H. Davis 222, Mrs. E. F. Ball 225, 227; C. G. Washburn 230, 231; I. T. Washburn 232, G. Davis 231, R. Stancliff 218, 214.

The following competitors are high in the re-entry cup contest closing on Thanksgiving Day:

Members: D. Brandreth 240, Amos Bedell 237, I. T. Washburn 232.

Non-Members: Geo. N. Tompkins 239, C. H. Sidman 239, F. Tompkins 236, G. Davis 231.

Ladies: Mrs. E. F. Ball 236, Miss Frances Gibson 222.

Cadets: E. H. Sherwood 229, R. Stancliff 218.

I inclose a clipping from the Montreal Family Herald and Weekly Star of Oct. 22, thinking same may be of interest:

"A peculiar incident happened at the rifle ranges at Victoria, Australia, recently. A man was taking aim at 400yds., and just as he fired several magpies flew in front of him at about 200yds. distance. The bullet struck one of the magpies, and brought it to the ground, and a bullseye was registered by the marker for the shot. A bullseye and 'magpie' were thus scored at one and the same time."

E. F. B.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 14.—Princeton, N. J.—Intercollegiate contest between teams of Harvard, Yale, Princeton, Pennsylvania and Columbia.

Nov. 22.—Singac, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Fourth Tuesday of each month, Hell Gate Gun Club's shoot at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Second Friday of each month (January and July excepted), shoot of Hell Gate Annex, at Dexter Park, Brooklyn.

Saturdays, Brooklyn Gun Club's shoot, Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

Saturdays, Newark, N. J., South Side Gun Club's shoots, South Broad street, near Lehigh Valley coal depot.

Saturdays, Outwater's grounds, Carlstadt, N. J., live bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

We acknowledge with pleasure receipt of invitation to the all-day tournament of the Delaware County Country Club, to be held on Thanksgiving Day at Manoa, Pa. Shooting commences at 10 o'clock. Besides the championship event, there are eight optional sweepstake events at 10 and 15 targets, entrance 50 cents, 75 cents and $1; Rose system. Paid experts allowed to shoot for targets only. From Philadelphia Manoa may be reached via trolley to Sixty-third and Market streets, and Philadelphia and West Chester trolley; also by Pennsylvania R. R. to Llanerch station. The programme contains the following: "The object of this tournament will be to settle the much-mooted question of the individual and six-man team championship of Philadelphia and vicinity, for which events a handsome medal for the winner of the first-mentioned, and a valuable silver cup for the winners of the latter will be given by the club. At 1:30 P. M. sharp, the individual championship, 100 targets, handicap rise, 14 to 21yds., takes place. The six-man team championship, 25 targets per man, 16yds. rise, follows. Entrance fee in both events is the price of targets. An optional sweep on each 25 birds of 50 cents, Rose system. There will be no restrictions as to the number of teams entered by a club for the six-man team championship. Club captains will confer a favor by sending team entries as early as possible. Meals and ammunition can be secured in the club house. Trapshooting Committee members are Howard George, Chairman; C. H. Newcomb, Llewellyn R. Huber.

The press criticisms of Annie Oakley's (Mrs. F. E. Butler) new play, "The Western Girl," are eminently gratifying both as to the merits of Miss Oakley's acting ability, and the merit of the play in itself. From The Call of Nov. 7 we take the following: "A crowded house greeted Annie Oakley in her first appearance in Paterson, N. J., last evening at the Opera House, and every one went away more than pleased. "The Western Girl" is a melodrama constructed on new and novel lines by Langdon McCormick, replete with thrilling situations and based upon a story that has never before been told upon the stage. For the lovers of this kind of play this is the best that has been seen in Paterson for a long time. The scenery reproduces the picture of the wild and woolly West in its early days, and gives a vivid setting for the word picture of the bandits and outlaws of the plains, whose machinations are foiled by "The Western Girl" at every turn with her trusty rifle and good horse Bess, whose fame is heralded as being almost equal to Miss Oakley herself." Miss Oakley was the recipient of many boquets and hearty congratulations at this performance.

After the first of December there will be open live-bird shooting every Saturday on the grounds of J. H. Outwater, near Carlstadt, N. J.

Mr. Wm. P. Dutcher, of Paterson, N. J., writes us as follows: "The Jackson Park Gun Club will hold a live-bird shoot on Saturday, Nov. 22, at their grounds on the road to Singac, N. J., beginning at 10 A. M. sharp. The opening event will be at 10 birds, $5, and as soon after as possible, a 25-bird event at $10, birds extra. If time allows, there will be extra events. Lunch and refreshments will be served. At the club house plenty of shells can be obtained. The club house will be heated comfortably for shooters and friends. We expect this to be our banner shoot, and will provide the best birds that can be bought. We will look after the boys."

The cuts which illustrate the proper use of the shotgun, published in our trap columns this week, are taken from the Illustrated Sporting and Dramatic News (London), and are entitled "At a Shooting School; Stages through which the Tyro has to Pass." They are specially interesting inasmuch as they depict the thorough schooling from elementary principles to finished performance. They are valuable also in their instructiveness to those who are studying the art of shooting with the shotgun.

From the Baltimore Sun we clip the following: "On Tuesday, Nov. 18, the second Cecil county trap tournament will be held under the management of Messrs. H. Linn Worthington, Henry S. White and Cecil Kirk, on the grounds of the Gun Club, at Rising Sun. The programme includes five target events in the forenoon and six in the afternoon, the last being for the Cecil championship at 50 targets. The main prize is a gold medal, and ten others will be merchandise."

In the second contest of the Crescent Athletic Club for the November cup, at Bay Ridge, L. I., on Saturday of last week, Mr. H. B. Vanderveer was first with a score of 49 out of a possible 50. Mr. L. C. Hopkins was a close second with 48. Mr. W. W. Marshall scored the first win on the cup on the previous Saturday. It thus will be of greater interest during the remainder of the month than if one contestant scored two wins in succession.

Mr. C. V. V. Gunther, besides shooting skillfully and successfully in other events, recently made his second win on the cup of the Blooming Grove Park Association. A third win by him and it becomes his personal property. From the 28yd. mark he is now put back to the 30yd. mark, without any bird allowance, which makes him a scratch man.

The Carlstadt, N. J., Gun Club will hold a Thanksgiving Day shoot, open to all, excepting a club event, the main prize of which is a large plump goose, whose feelings are in touch with the holiday season. Turkeys and other poultry will be offered in abundance as prizes.

At the North Carolina State shoot, under the management of the Raleigh Gun Club, the State championship trophy was won by Mr. J. D. Carrier, of Asheville, with a score of 71 out of a possible 75. Col. James T. Anthony, of Charlotte, was a close second with 70.

The five-man team match, an annual target event between Harvard and Pennsylvania universities, was held on Soldiers' Field, Boston, Nov. 8. Harvard was victorious by a score of 135 to 96. Each man shot at 50 targets.

Nov. 14 has been fixed upon as the date for the Intercollegiate trapshooting contest between teams of Harvard, Yale, Pennsylvania, Columbia and Princeton, to be held on the grounds of the latter University.

The Fulton Gun Club, of Brooklyn, N. Y., will hold a prize shoot on Nov. 16, to which every one is welcome.

BERNARD WATERS.

Raleigh Gun Club.

RALEIGH, N. C., Oct. 31.—Our second annual tournament, Oct. 29 and 30, has come to a successful finish. Although our programme should have attracted more shooters, it is just on the eve of game shooting, and this may be one reason for a small attendance. If the trapshooting fraternity had been picked, we could not have had a nicer representation of amateurs and manufacturers' agents. All were old friends, having been with us quite a number of times before, except E. H. Storr, and it was only a short while before we all knew him well and felt at home just as with the others. A more genial, gentlemanly representative never went on the road, and we want him again. He didn't fail to hold up his people's goods either, as he was high average for the tournament shoot.

The following representatives were with us: Capt. Ben Eick, H. P. Collins, L. D. Thomas, E. H. Storr, J. Avery, Chas. Nichols.

Other visitors present were Col. J. T. Anthony, Charlotte, N. C.; J. D. Carrier, Asheville, N. C.; T. F. Stearns, Newport News, Va.; P. J. Gallagher and J. W. S. Butt, Portsmouth, Va.; P. G. Welch, Greensboro. Quite a number of other shooters participated, but did not shoot through the programme.

The first day a stiff wind played hide-and-seek with the targets, and throughout the whole shoot the traps would break about one-third of the targets thrown, causing no little trouble to each shooter, and no doubt pulled their average down.

The State championship trophy was won by J. D. Carrier, of Asheville, N. C., making 71 out of 75. Col. Anthony, of Charlotte, N. C., was second with 70. Jas. I. Johnson, of our club, shot well and came out third highest in the contest. The following scores were made:

	Shot at.	Broke.		Shot at.	Broke.
Anthony, 20	380	306	Butt, 17	380	303
Carrier, 20	380	317	Welch, 16	380	251
Johnson, 19	380	314	Thomas, 17	380	263
Eick, 20	380	304	Stearns, 17	380	301
Avery, 19	380	277	Whitaker, 17	365	239
Collins, 17	380	228	Ellington, 16	245	182
Tennessee, 19	380	302	Gowan, 17	275	208
Gallagher, 19	380	301	Pearce, 17	190	161
Storr, 20	380	330	Lyon, 16	150	104
Gray, 16	380	245	Stark, 16	195	136

The Harvard Shooting Club.

CAMBRIDGE, Mass., Nov. 10.—I send you inclosed the scores made last Saturday in the match of the Harvard Shooting Club vs. Pennsylvania Shooting Club. The shoot was held on Soldiers' Field over a magautrap and under very unfavorable weather conditions, there being a high wind, which made the birds turn and twist like jacksnipe. The light was also poor. The fact that the match was held the morning of the big football game between the same universities probably had something to do with the poor scores.

Both teams hope to decidedly better their scores in the Intercollegiate shoot, to be held at Princeton on Nov. 14, where five universities—Harvard, Yale, Princeton, Pennsylvania and Columbia—have entered teams.

The scores, 50 targets:

Pennsylvania Team.

E. E. DU PONT.

ON LONG ISLAND.

Crescent Athletic Club.

Bay Ridge, L. I., Nov. 8.—The weather was pleasant, and the attendance was good. Much better, in fact, than has been present during some weeks past. Mr. H. B. Vanderveer scored the second win for the November cup, the first having been secured by Mr. W. W. Marshall. Mr. L. C. Hopkins scored 48, only one less than the winner. The scores follow:

November cup, 50 targets, handicap allowances added:

	Al'ce.	Brk.	Tot'l.	Al'ce.	Brk.	Tot'l.	Total.
H B Vanderveer	4	21	25	4	20	24	49

Brooklyn Gun Club.

Brooklyn, L. I., Nov. 8.—A moderately stiff wind made the target flights somewhat erratic, and the scores were affected accordingly. S. Glover was easily the highest performer, though he shot in only a limited number of the events. Mr. T. E. Batten tried his new gun for the first time on targets, and was much pleased with its performance. He has not shot at the traps in some years, but is gaining in form, and soon will be on even terms with the leaders. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	15	15	10	25	15	5p	15	10	15	10	25	10
Waters	13	9	7	21	13	5	15	9	9	8	19	8

WESTERN TRAPS.

Garfield Gun Club.

Chicago, Ill.—The appended scores were made on our grounds to-day on the occasion of the sixth trophy shoot of the fourth series. J. E. Dafter carried off the honors by going his 25 straight and winning Class A trophy. Wilson won Class B on 21. C. J. Wolff won Class C on 16.

The cup shoot immediately followed, and was won by Dr. J. W. Meek on a score of 22 out of 25, thrown as 15 singles and 5 pairs.

The day was a beautiful one, and ideal for trapshooting. All present seemed to fully enjoy themselves. Attendance not what it ought to be. Too many members are away after game.

Twenty-seventh trophy shoot, 25 targets, Classes A, B and C:

Wilson	11111011101111111101011111—21
Dr Meek	11111011011111111111111111—23
C J Wolff	10101011111101010100111101—16
Dafter	11111111111111111111111111—25
Frank Ellis	11111000110011011111011110—17
L Wolff	10100101100001010111100001—12
Ford	10110111001110111111011110—18
Thomas	10111101111011101111101101—19

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Barrels as We Find Them.

One of the most interesting tasks of our shooting department is the examination of barrels which are sent to us for private report by various correspondents. As a general rule, some defect has developed, either in the way of noticeable flaw or a marked tendency to bad shooting, and our opinion is asked either upon obvious injuries or as to general capability for every-day work in the field. By this and other means we are enabled to obtain useful information. Our experience in the shooting of cartridges also affords us valuable data. The average shooting man is in constant quest of the perfect cartridge; but we have endeavored to show in previous articles that, even when cartridges are all that can be expected, it does not by any means follow that good shooting will be obtained from every gun firing them.

Although we must ourselves accept the responsibility that attaches to the publication of excellent records of patterns, it is to be hoped that no sportsman will suppose that these are to be obtained from every gun with the same nominal boring. As a matter of fact, it is our general experience that pattern is, more or less, a question of gun, provided the cartridges are all right; but the number of perfectly bored guns turned out in a year bears a very small proportion to the number manufactured. Furthermore, barrels may be damaged in use, which necessitates a certain amount of re-boring, though the interference with the original dimensions is very small when the raising of dents is carried out by a really competent person. If only sportsmen could realize that for about nine inches of a barrel's length the walls are no stouter than the aggregate thickness of seven sheets of the paper on which the home edition of the Field is printed, they would be much more careful how they handled their guns. Barrel steel of this thickness cannot possibly be made to stand violent treatment of any description. In fact the tubes before jointing together are so frail that, with one end firmly held in a vise, the muzzle will spring by slight finger pressure nearly half an inch. Of course, when assembled in the double-barreled form the gain in stiffness is very great; but the tubes are still as liable to injury as the framework of a light racing bicycle. If, therefore, a sportsman has purchased a light game gun, he must remember that it is almost impossible to allow more than about three pounds for the weight of the barrels. The strength required at the breech necessitates a proportionate thinness forward, where the powder pressure has considerably subsided, so that it is a matter of very skillful manufacture to make sure that the available metal is disposed in the most advantageous manner possible. This no doubt accounts for the number of guns received, which upon examination are found to be in a very strained condition for a great part of their length.

When looking down the tube of a sound pair of barrels the shadow of light thrown from the top of a window gives the appearance of a flow of ink toward the muzzle as the latter is gently tilted upward. If the apparent flow is irregular and jumpy, and little marks and rings show up just in advance of its forward extremity, then there is evidence of a weak or overstrained barrel. A similar shading of the outside of the tube will, in such cases, demonstrate irregularities having the same characteristics. We know of cases where barrels having this peculiarity have been badly dented, their natural weakness, of course, promoting the tendency to give way to slight impacts. As a general rule, it is possible to raise such dents without making the barrels weaker than before, though on the other hand, such an operation should not be authorized, except under competent advice that the barrels are of sufficient strength. A comparison of the inside and outside dimensions of a barrel will frequently show a difference that implies a sufficient thickness of the walls, provided, of course, the external and internal circumferences are concentric, but this is an exceedingly difficult condition to guarantee. When, as in the case of some barrels, there is an obvious thinness over a certain area, it is only reasonable to suppose that the walls are of irregular thickness around the circumference, or that an insufficient margin has been allowed between the two diameters. Good barrel making is rendered difficult by the fact that the eye, and the eye alone, is the sole test of straightness in a tube.

In the early stages of barrel manufacture, the tube, as it comes from Birmingham or from Whitworth's, in Manchester, is bored to an average diameter of about .010 less than the nominal finished size, and the exterior diameter has a still more liberal allowance for subsequent operations. The number of workmen who can by looking down such a tube, detect any slight want of straightness is limited. Granted, however, a competent workman, the tube may be bent or "set" until the proper conformation of bore is obtained. It is admittedly impossible to bore a straight hole over so great a distance as thirty inches, and the sole means of ultimately obtaining the required trueness is to set the barrels until the faults of the first drilling are rectified. It is well known that in the operations of boring out a tube to the requisite diameter an untrue barrel cannot be made into a true one. If, on the other hand, the irregularities are altered by setting the rough-bored tube, the subsequent operations of the boring tool will work the hole out clean and true, so removing the local irregularities produced by the setting process. By this means a pair of tubes in the rough are made true in the interior. To make the external surface in agreement with the bore the barrel is truly spun upon a lathe, and grooves are cut on the surface, which are necessarily concentric with the bore. These grooves are cut at different distances along the barrel, corresponding in depth with the required thickness of the walls at those points. The subsequent filing, known in the trade as "striking," makes the general contour of the barrels agree with the strength demanded at the different parts of the barrel, the grooves previously cut in the lathe serving to guide the workman in removing the surplus metal.

The above short reference to some of the operations of barrel manufacture will show that, given the capacity to form a true interior for the barrel, the exterior may be harmonized therewith by the use of a lathe. If, however, a bend or curve in the bore is passed uncorrected, the turning process will cause one side of the tube to be thicker or thinner than the other. It happens in this way that barrels of ample weight, and having a sufficient allowance for thickness of wall, show signs of distress due to local thinness of the walls, and it is such barrels which give trouble when dents occur. The operations of boring have a vast influence upon the patterns produced by the gun. The chamber must be true to size in order to provide for proper combustion of the powder, or else velocity will suffer. That part of the barrels beyond the chamber must be strictly parallel until the choke is reached, and here again skillful workmanship is an essential factor. A gun we recently examined showed a difference of as much as .010 of an inch in the diameter at different parts of the length, such a variation being of a kind to cause peculiarities of behavior that must influenc the effectiveness of the shooting.

We therefore maintain that in a good gun the chamber and the rest of the bore must be in agreement with the standard sizes and strictly parallel throughout. The exterior must be similarly correctly formed, so that the expansion of the barrel under the action of the powder gases shall be regularly distributed around the circumference. With the above conditions fulfilled, and a chamber true with the cone, the cone true with the bore, and the bore with the choke, good and regular shooting is almost bound to result, the distribution of the pellets as regards number on a thirty-inch circle being proportionate to the amount of choke allowed for. We cannot accept as desirable any kind of tinkering with the bore of a barrel when once the conditions laid down have been complied with. It is only when a barrel is badly made that there is any apparent need for those tricks of boring which are supposed to improve pattern, but which generally do so at the expense of introducing other defects. In asking, therefore, for good shooting from a cartridge, the sportsman must assure himself first of all that he has a well-bored gun; but he must not expect a high grade of workmanship in this direction at a price which does not pay for the needful operations of inspection and adjustment.

Reverting once more to the results of experiments for patterns, such as are published in our columns from time to time, we can only say that they are produced by the aid of a gun specially selected on account of its proved capacity for doing good work. Some day we hope to publish a series of records, showing the behavior of various standard cartridges as fired from different kinds of guns selected haphazard from those we have constantly available. It is no uncommon thing when testing a gun to find cylinder patterns suddenly run down from 110, or with improved cylinder 140 to 50 or 60, which would be hardly capable of insuring one pellet on a six-inch bullseye at forty yards. For the purpose of testing powders and cartridges such guns are instantly discarded, though, of course, sportsmen not being able to do likewise with their game guns, must encounter a certain proportion of disappointing results. We are not certain that there is any royal road to a remedy for the difficulties we have named. It is not every sportsman who cares to pay the price of a best gun, though it is among these that the most consistently accurate work on the barrels is to be met with. There are, of course, exceptions to every rule; but the reputation of the maker remains as always the chief safeguard. We think, however, that if gunmakers would adopt a strictly standard form of boring, limiting the allowable variations of diameter by the use of suitable gauges, and would refuse to countenance systems of freak boring, and would generally set their faces against the undue sweating of weight in guns whose price does not allow for the necessary quality of workmanship, a marked all-round improvement would be registered. Then by the paying of more consistent attention to the straightening of the rough tubes and to their proper assemblage without pulling them round bow-shaped, they would be enabled to produce their weapons to a more consistent standard than seems to be observed among the cheaper grades at the present time. More than this, very careful attention should be paid to all barrels that come in for repair. It is more often than not possible to remove dents; but if the barrel was previously too thin it can be no certificate of strength to guarantee an equal degree of security to that which previously existed. The gunmaker is, as a rule, a master of mechanism, but it is difficult, in the ordinary course of his daily work, for him to become equally expert in the examination of barrels. Unfortunately, that most valuable instrument, the Allport barrel gauge, is no longer purchaseable. We hope, however, to be in a position shortly to give particulars of an appliance which, we think, will serve a useful purpose in dealing with the barrels which are sent to us for examination and report.—Field (London.)

Do not bring the barrel up to the stock, but— Depress the barrel and raise the stock.

The Right and Wrong Method of Loading a Gun.

The Right and Wrong Method of Carrying the Gun when Walking up to the Birds. The proper way is shown in picture on the left, and the other on the right.

Trapshooting Beneficence.

Ossining, N. Y.—*Editor Forest and Stream:* Apropos of trapshooting, now that the game shooting is about over, those who have been foremost in shooting afield will attend the regular Saturday afternoon shoots to improve their form. Some have found that the thing most necessary for them to do to enable them to bring home a string of game was to hire some one to go along to do the shooting. These weekly clay-bird shoots are attractive from different standpoints. First, in appealing to one's vanity. If a man becomes a good clay-bird shot, he can hit anything that flies, accurately gauging the speed, whether from right to left, mastering the elevation, which is not the simplest thing in wing shooting, he may be able in a year's consistent practice to bring down 50 per cent. of his birds. You wonder where the vanity comes in. Did you ever go hunting with some good shot and have him repeatedly "wipe your eye"? Wouldn't you at the time have given a dollar a shot if you had dropped the bird instead of giving him the chance to look at you in a superior sort of a way as he picked up the bird and stuck it in his already heavy game pocket?

You have been leaning over a desk all the week; your shoulders have been stooped, thus compressing your lungs. Possibly you have been breathing the impure air of the city, doubly impure since soft coal has come into use. You need recreation; your system needs revivifying. Two hours of the pure air at the shooting ranges, with the gentle jarring of the gun, will open the unused cells of your lungs and will make you feel like a new man. These unused cells of our lungs, which we all have more or less, are the ones which foster disease germs. Tuberculosis lurks here. Show me the man who loves outdoor sports, who likes to shoulder a gun and tramp through the woods, rustling and pressing the crispy leaves underfoot and smell their fresh fragrance; who loves the open air, the God-given pure north winds which blow down laden with the indescribable balsamic freshness which even the interlying cities cannot taint, and I'll show you a man who has no need to fear tuberculosis or kindred diseases, and one who, as Nessmuk put it, can, if need be, "Trusted with your life." This is an appeal to those of us who are apt to neglect the simple demands of health in the pursuit of the hackneyed "almighty dollar." To those who scorn what they consider a frivolous pastime—clay-bird shooting—a game which, by the way, demands better control of the nerves and muscles than they can command; to trapshooters, hail!

C. G. B.

IN NEW JERSEY.

Mountainside Gun Club.

Orange, N. J., Nov. 4.—The main event of the shoot of the Mountainside Gun Club to-day was at 25 targets. Mr. C. Zeigler was high, with 24, and Mr. A. Baldwin was second with 22. The scores:

A Baldwin	1110111011111111111110111—22
M R Baldwin	1111101111101111001101101—19
M F Pratt	1001111101011101111111110—19
A Williams	1111110111110101100110101—18
F Wright	1000110101111001110110111—16
C Zeigler	1111111111111111111111110—24
W Henley	1011000101110110011011100—14

Two target sweepstakes were shot as follows:

C J Zeigler	10	8	M F Prott	8	7
W Henley	7	6	A Williams	7	6
A Baldwin	9	9	F Wright	6	7

Answers to Correspondents.

No notice taken of anonymous communications.

R. T.—See the point discussed in our shooting columns.

T. B. J., Toronto.—When shooting partridges or quail, which is proper in the case of a hammerless gun, to have the safety on or off in going through the woods? Ans. Off. When shooting partridges or quail in cover, there is no time for mechanical readjustments. However, whether the safety is on or off, the gun should be carried so it cannot do "accidental" harm.

PUBLISHERS' DEPARTMENT.

Messrs. Schoverling, Daly & Gales, 302-304 Broadway, New York, have published a catalogue of guns, shooting and fishing accessories, descriptive of different qualities and grades which they will be pleased to send to those who are interested in gun, dog and rod. Besides being valuable for the information with which it is replete, it is pleasing as a work of high art.

The experts whose views are given are: Past-Masters Joe Manton and Joseph Lang; Atkin; Beesley, Boss & Co.; Churchill, Cogswell & Harrison, Gibbs, Grant, Greener, Holland & Holland, Jones, Lancaster, James Purdy & Sons, Rigby, Watts, Webley, Richards.

FOREST AND STREAM PUBLISHING COMPANY, NEW YORK

For Anglers and Big Game Hunters.

A Big Game and Fish Map of New Brunswick.

We have just had prepared by the official draftsman of New Brunswick a map of that province, giving the localities where big game—moose and caribou—are most abundant, and also the streams in which salmon are found and the rivers and lakes which abound in trout.

The resources of New Brunswick in the way of game and fish are only just beginning to be appreciated, and we are glad to offer to FOREST AND STREAM readers the first authentic information as to localities where sports may be had. The map is printed in colors, on a tough paper, and is enclosed in a stout manila envelope for protection in carrying. Price $1.

VON LENGERKE & DETMOLD, 318 Broadway, New York.

FIRST COST
VS.
OPERATING EXPENSES AND PROFIT
As Applied to the Modern Shot Gun.

You will hear it said that GREENER GUNS are high priced, and so they are—comparatively.

A trolley line is also expensive, and the cost to build an elevated railway is enormous, but if it is well done and the best material used they last indefinitely and begin to show a profit almost at once, even at so low a fare as five cents per passenger.

The same argument can be urged to the purchaser of a Greener gun. The first cost is considerable—necessarily so—for the labor is skilled, the material the best and the brains and experience of the maker all count for something.

Ordinary guns, and guns turned out by machinery, only last a season or two and are then discarded and begin a fitful downward career until they are finally lost in oblivion.

A Greener Gun, on the contrary, does not fairly begin life until it is several years old, and the few thousand shots that will rack the cheap gun to pieces simply smooths out the Greener and acts on it like oil on a fine bearing, and emphasizes those niceties of fitting that were part of the original cost, and which makes a gun really worth having.

Dr. Carver shot a Greener gun over a million times, and we have the gun here now—would not take $1000 for it—and it is in good condition yet after all these years.

If you want a gun that will shoot the strongest and the longest, pay a little more and buy a Greener. Eight gauge to twenty-eight gauge in stock. $100 to $600.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

HOW PLANTS TRAVEL.

ONE of the things which constantly impresses the observant outdoor person at this season of the year is the enormous abundance of the fruit of various plants. The season for cultivating the ground is long past, and weeds of all descriptions run riot in ripening luxuriance. They grow in thick clusters, or widely extended beds, or in single plants in the pastures, along the fences, in the edge of the woods and on the rocky knolls that rise above the meadow, and each weed, it would seem, produces a thousand seeds. If one walks through the border of the swamp his trousers are coated with burrs, or with stickers and prickers of one kind and another, that are [illegible] laborious process of [illegible]y one. Anyone strikes his stick or his gun barrel among a growth of weed stalks, the seeds rain down noisily on the drying leaves.

Great Britain, $5.

The farmer toils hard to protect his crops from their many enemies, but no one takes care of the weeds. These plants out of place are competent to stand up for themselves. They need help from no man. In spite of the war continually waged against them with plow and hoe and cultivator, and in spite of the help given the farmer at this season of the year by the horde of sparrows and other seed-eating birds which feed upon the seeds, the weeds flourish and increase. It has been said of some of them that they produce so astonishing a number of seeds that a single plant may mature one hundred thousand seeds in a season, and if unchecked would produce in the spring of the third year ten billion plants, but a plant would destroy its own offspring, unless there were some way of distributing its seeds, for plant would crowd on plant until at last there would survive only a very few of the strongest.

If the abundance of these seeds impresses us, we must be impressed also by the risk to which each seed is exposed—the danger that it will fall in some situation where it is impossible that it should sprout.

Nature has provided a variety of means for the scattering of plant seeds over the earth, and beside the dispersion of plants by seeds, there are other methods by which plants travel. These methods are very well known, and in a very brief pamphlet recently published by Mr. Clarence Moores Weed, they are concisely enumerated.

Some plants travel by means of the stem. They may thrust this stem through the ground close to the surface of the soil, as does the red raspberry of our gardens, or they may push their stems along the ground just above the surface, as the strawberry and many other plants send out runners. Or again, the stem may rise above the ground, and then bend down to meet it and take root for a new plant, as does the black raspberry. One would hardly think of the willow tree as a stem traveler, yet it is one. If a willow branch be broken from the parent tree and thrust into moist earth, it will take root and grow. Now the stems of many willows are brittle and snap off easily in the wind, so that after a severe storm the ground is often covered with them. Such twigs may be carried down stream by flowing water, or may be blown across the ice of a pond or for considerable distances over the smooth surface of snow. In either case if the traveler comes to rest in a suitable situation it may take root and start a new tree.

One of the most familiar plants of the country is the jewel weed, whose orange flowers, often dotted with dark brown, overhang the brooks. The ripened seed pods of this weed when touched burst open with a snap that often throws the inclosed seeds several feet. From this the plant has been called "touch-me-not." Similar methods of seed dispersal are found in the witch hazel and in various tropical plants.

But, after all, the wind is the agency which more than anything else scatters seed abroad far from the parent plant. The silky tufts of the milk weed, the down of the thistle, the winged seeds of the maple and ash, and other trees, and the plumose fruit of the aster and many other similar plants are lifted by the wind and scattered far and wide.

There are other seeds which break off just below the seed head, or even just above the root, and which are rolled over and over by the wind, making long journeys, until at last they meet some obstacle which they cannot pass. An example of these is found in the familiar tumble weeds of our Western prairies.

We have seen how the water carries along the twigs of the willow tree, and it is certain that it will not disdain to transport the seeds of any plant which fall into it if they are light enough to float. Some seeds possess small air chambers which enable them to float for a long time.

If the elements are at work all through the season of fruitage, scattering the seeds of plants over the earth, living creatures are also most important agents in distributing plant life. Birds carry the seeds, far and near, and drop them in places which favor their sprouting. Ducks and herons pick up the seeds of water plants on their plumage or legs or bills and carry them to the next stream or pond which they visit; fruit-eating birds devour berries and as their seeds are too hard to be digested, these pass through the alimentary canal or may be disgorged through the mouth.

All the great family of burdocks, Spanish needles and many other plants are provided with hooks or spines by which they attach themselves to the fur or wool of animals, and so are transported from place to place. Some flat seeds seem provided with a gummy secretion, which enables them to cling closely to a very smooth surface.

Wittingly or by chance, man contributes his share to the distribution of seeds. Beside carrying the seeds of useful and beautiful plants from point to point, he sends the seeds of others which are noxious far and wide without meaning to do so. Many well-known plants of Europe are now almost as familiar here as there, even though they have been introduced for a comparatively short time.

WILLIAM K. MOODY.

IN another column is reported the death of William K. Moody, whose Boston correspondence over the familiar signature of Special had for years been a feature of the FOREST AND STREAM. Mr. Moody has a very wide acquaintance among sportsmen, and the news of his death will bring to many a heart unaffected sorrow. The characteristics of the man, which could not fail to impress themselves upon all who came in contact with him, were the open simplicity of his nature and his rugged honesty. It was good to know him. To talk with him and to be infected with his spirit was refreshing and stimulating. Mr. Moody was a native of Maine; he was ever loyal to the State of his birth, and was deeply interested in its game and fish and their preservation. His pen and his voice, his influence and his friendship will be missed.

THE COLD STORAGE CASE.

EVERY sportsman and every intelligent citizen as well will be interested in the session of the Court of Appeals which began at Albany on Monday, the 10th instant. The calendar made up for this session contains as case No. 340 the famous cold storage litigation, technically known as the case of the People of the State of New York against Jacob V. Bootman and Howard R. Robinson. This is the case brought by the Forest, Fish and Game Commission of the State against the Arctic Freezer Company for the alleged posession of a vast amount of game during the close season. The State has retained the well-known law firm of Black, Olcott, Gruber and Bonynge, of this city, to represent the People, and the accused cold storage firm is represented by Julius Offenbach and Louis Marshall.

The court records show that the action was begun by the service of a summons and complaint on Aug. 18, 1901. The order on which this action was begun was made by the chief protector on July 6, 1901.

An amended complaint was afterward filed by the attorneys for the State, basing the cause of action on nineteen separate and distinct counts for unlawfully and knowingly possessing game out of season, as follows: (1) 496 grouse and 236 quail, entailing a penalty of $18,360; (2) 371 grouse and 741 quail, penalty $27,860; (3) 491 grouse and 37 quail, penalty $13,260; (4) 96 woodcock, 1,168 grouse, 1,030 quail, penalty $57,410; (5) 1,563 grouse, 425 quail, penalty $47,260; (6) 3,049 grouse, 1,318 quail, penalty $84,225; (7) 422 grouse, 1,048 quail, penalty $36,810; (8) 4 ducks, penalty $160; (9) 441 ducks, penalty $11,085; (10) 432 ducks, penalty $10,860; (11) 400 ducks, penalty $10,060; (12) 338 ducks, penalty $9,010; (13) 141 ducks, penalty $3,585; (14) 808 plover, penalty $20,260; (15) 876 English snipe, 602 plover, 1,416 snow buntings, 96 snipe, penalty $74,810; (16) 288 reed birds, 3,630 plover, 1,152 snow buntings, penalty $126,935; (17) 1,336 snipe, 3,168 sandpipers, penalty $112,660; (18) 720 reed birds, 5,760 snow buntings, 1,439 sandpipers, 488 yellow legs, 150 plover, penalty $217,085; (19) 3,658 plover, 3,000 sandpipers, 4,800 snipe, 300 yellow legs, penalty $294,110.

Judgment is demanded on the several counts against the defendant in the sum of $1,168,315 and costs.

The attorney for the accused demurred on the ground that the complaint did not state a cause of action, and also that the court had no jurisdiction. The case was tried before Mr. Justice O'Gorman in the Supreme Court of New York County, who held in favor of the accused on the counts from 14 to 19 inclusive on the ground that Sections 30 and 33 of the game law could not be reconciled. This, if sustained, released the plover, snow bunting, reed birds and snipe as factors in the case. He decided also that the game law extends over the entire State; that an offender against the law is liable both criminally and civilly, and that possession during the forbidden season is *prima facie* evidence of violation of the law. Both the State and the defendant thereupon appealed to the Appellate Division of the Supreme Court, which affirmed Justice O'Gorman's decision. An appeal was then taken by both parties to the Court of Appeals; the attorneys for the People against the findings of the Court as to the interpretation of Sections 30 and 33, and the attorneys for the accused against those portions of the decision which found the cold storage company guilty of violations of the law. This case was watched with great interest by sportsmen as well as by the cold storage companies and by intelligent citizens generally.

In the brief now on file with the clerk of the Court of Appeals, the lower court certifies that the questions of law involved are as follows:

1. Do counts 1 to 13 inclusive constitute a sufficient cause of action?

2. Is the plaintiff entitled to maintain a civil action to recover penalties under Section 39 of the Fish and Game Law for a violation of any of the provisions of Article 2 of the statute of which it is a part?

3. Is the complaint defective in not alleging that the various birds were taken in the State of New York?

4. Are sufficient facts to form a cause of action stated in counts 14 to 19 inclusive.

5. Can the defendants be made liable under Section 33 of the Fish and Game Law as amended by Chapter 91 of the laws of 1901 and Section 39 of said act.

The attorney for the People is under express instructions from the Commission, and has been so from the start, to urge this case to a conclusion with all the speed commensurate with the dignity of the courts.

The facts herein stated can easily be verified by any interested person from the court records on file in New York City in the office of either of the firms mentioned.

A RECORD OF THE MISSOURI.

THE FOREST AND STREAM of Nov. 1 contained an article and illustration of a stone picked up near the mouth of the Heart River in North Dakota, engraved with a number of names and the date 1849. At this time the Territory was without white inhabitants, except the trappers and traders who occupied the occasional posts of the American Fur Co., which were scattered along the Missouri River and at other points in what was then known as the Far West. In that account we asked, "Who were the men who carved their names on this imperishable register?" "Can any of our readers help to read the story told by this stone?"

This week's FOREST AND STREAM contains an answer to these two questions in the form of a letter from Mr. Theo. Louis, who, 50 years ago, was in the employ of the American Fur Co., and traveled far and wide over the western plains then ranged over only by wild beasts and still wilder men.

The discovery through the account in FOREST AND STREAM, of a man who knew one of the travelers whose names are engraved on this stone, is hardly less interesting than the discovery of the stone itself. It shows—as has often been shown before in most curious fashion—the far reaching influence of FOREST AND STREAM, the wide circle which it covers and the deep interest felt by all its readers in the subjects of which the paper treats.

All our readers will feel grateful to Mr. W. D. Hoard, of Ft. Atkinson, Wis., and Mr. Theo. Louis, one of the few surviving old-timers of the West.

President Roosevelt has been bear hunting in Mississippi. Grover Cleveland has been duck hunting in South Carolina. King Edward and Emperor William have been pheasant driving together at Sandringham. King Leopold and Grand Duke Alexis have beeen shooting on the preserves of James Gordon Bennett at Versailles. President Roosevelt insisted upon seclusion. Only duly accredited representatives of the several press associations were permitted to accompany his party; other reporters, contumeliously scorned as "insurgents," were stood off from the bear brakes by armed guards. King Edward and Emperor William, on the contrary, did their shooting in the presence of crowds of spectators, who appeared to have been deeply impressed by the manual dexterity and deadly marksmanship of the Emperor. The taking along of newspaper reporters in the Roosevelt party, marks a change which is rapidly progressing in this country. Ten years ago when President Harrison went duck shooting on the Ragged Island Club grounds, he was unattended by reporters; to-day, when a President goes hunting, the press representatives go with him; ten years from now excursions will be run to the camp.

The Sportsman Tourist.

Two Years' Outing Across Siberia.

THE writer was engaged most of the year 1896, all of '97 and part of '98 on a detail of inspection of the then building trans-Cibiria railroad, followed up by a prolonged tour of the chief connecting and feeding Russian railway network. The work was commenced on the Pacific side, in extreme eastern Cibiria, and ranged from the 43d to the 60th parallels (average, 55 degrees). The total time on detail was 676 days.

Omitting all technical data, it can readily be conceived that a few articles on the outing features of the trans-Asiatic inspection, in a land which is yet a terra incognita to the mass of Americans, will naturally present some interesting material.

While a complete diary of the journey was daily kept, and is still on hand, I doubt if its mass of items would "digest" very well with readers; so its proposed reproduction was abandoned for the happier idea of confining the articles to a selection of the "plums" here and there. This I have done, without regard to order of sequence, as the more interesting phases occurred to me.

Cibiria as a Ground for American Sports.

The completion of the thru-trans-Asiatic railroad calls attention to Cibiria as a possible field for American sportsmen; that is, those men whose walking stick is their gun, and whose Bible is a well-filled pocketbook (backed by an unfailing bank account).

Why, yes, by all means give Cibiria a trial. You will have such a "ruf-tuf" time of it; remembrances of nights when you most needed repose, being rendered almost delirious by the onslaughts of treble-sized, stinking bedbugs in the stancias (resting or posting stations) and otels (inns); the lively experience of being able to buy everything you don't want and nothing (or very little) that you do want; pettifogging restrictions as to passports, and delays which you will not readily understand; having to doff your hat when going into every government building—from post-office to grog shop ("pub."), since even now the official monopoly has taken hold of the privilege of making the Russian drunk!

As to sport, why you must take your chances. You will find the Government officials and exiles have for years been keeping their hand in, and as there are no laws yet as to closed seasons, the game are given no chance, and are far, far from the haunts of "the madding crowd."

Cibiria being such a country of vast distances, and the impenetrable forests being dangerous to get lost in, better, for the sake of "society" (save the mark!), see if you can go with some of the parties of trappers. You can learn their whereabouts in the markets in the big towns, since they come and go with their skins and kit. But Cibiria is in places so desolate, you appreciate anybody's society—even to see a few human faces such as those of criminal convicts. However, they are as "harmless as butter."

And when your Cibirian trip is over, you will appreciate your America and its creature comforts as never you did before in your existence. Ability to better appreciate the "goods ye have," will be your lasting recompense.

A Vermont Sporting Goods Dealer in Cibiria.

To my surprise, I came across at Bladiboctok, on the Pacific, an old firearms importer named Smith, who came from the Green Mountain State, and had been some thirty years in Cibiria. He can tell of a few adventures in the land—and manufacture a good many more. He stocks leading arms, knives, hatchets and camping-out parties' equipments; has no regular price, but gets whatever he can on the maximum scale. I bought nothing of him, having laid in everything for the overland trip to Europe before reaching Bladiboctok. That town is, or was, a free port, the only free port I was in in my life—and that was the only good thing about it. A more abominable, dirty, big village I was never in during half a lifetime of travel. It is known as "the hell of the frigics," in contradistinction to Kalikata (Bengal), which is known as "the hell of the tropics."

Cibiria as a Market for American Sporting Goods.

It goes without saying that American sporting goods are appreciated by Russians, the Cibiriaks, and foreigners in Cibiria. This is speedily proved by the number of imitation Smith & Wessons you will see from end to end of the land. They are made in and imported from Germany, and the stamping alone of the firm's name on the barrel, with number and dates of patents, are so bunglingly done—rendering the lettering indistinct—that you can see at once the forgery. Take the genuine Springfield article, and the lettering and punctuation is a model of good die-sinking.

Then, as to the rifles. The forgers seemed to have preferred, for this line, British goods. Thus, you will find cheap Belgian made guns stamped "Greener," sold at prices which "defy competition" (naturally). Those enterprising continental jews find Cibiria a happy dumping ground for their "genuine American" and "British" forgeries.

But, as to seeking a market in Cibiria for American sporting goods, the process is very simple. Send along your usual catalogues and prices to the chief Cibirian hardware importers. These are the concerns which handle such goods. Their names and addresses can be obtained in any of the foreign trade directories. I have in mind a few score of them, and will one of these days, with the publisher's approval, send copies of FOREST AND STREAM to the chief ones making sporting goods an object rather than an item of trade. I mention this to enlighten those advertisers who may a few months hence perhaps be mystified somewhat by receiving inquiries from such a far country as Cibiria.

How the Cibiriak Shoots.

The average native is provided with a half-century old flint-lock (some of the antiquities I saw in actual use must have been some eighty years old), and a government-rejected or army out-of-date rifle, often crudely hand-transformed to suit their own pastoral needs. Here and there you will see a stolen rifle or two, but always used with discretion, to prevent any official inquiry as to "where did you get that?"

Powder and shot are as valuable as cash to the native, and he must not waste any on vain discharges. So he carries along a collapsible tripod, and poses the gun thereon when taking aim. The steady aim thus secured makes them good shots, and some of their "bags" would put to shame the efforts of some of our American dollaraires, young and old, who, with all their quick-fire lead-pumping repeaters and luxurious facilities, make a less showing in comparison than the poor Cibirski mujik with his flint-lock.

Sport on the Amur.

My first trip across the Amur was on Monday, June 13, from the ill-conditioned, murky town of Kabapofck. There is only a long-distance passenger steamship service on this great waterway, with stopping stations sixty to one hundred miles apart. If you want to go across the river, or a short distance of fifteen or twenty miles, you must hire a native excuse for a boat. This is a crudely made flat-bottomed rig, which they dignify by the name of "chalûp" (from French, chaloupe).

A party of a dozen peasants were returning to their village up and across the river, and arrangement was made for me to go with them. So soon after noon, we pushed off, and I made up my mind the crazy thing of a boat stood a chance of going to pieces when we got into the middle of the surging Amur. But no; it held together "out of pure cussedness," and that evening I spent the first night north of the Amur.

On the morrow, regular work began from this point inspecting what had been done on the railroad. (All this constructing work has since been abandoned in favor of the shorter trans-Manchurian line, and to-day you only see the decaying vestiges of what had cost some twenty millions of rybli (pronounced rubli) to build—track, wood bridges, etc.)

Great is the solitude of this region. A buck that will start up almost in your paces, turn and deliberately face you before plunging into the forest undergrowth, marks this as a region for the future sportsman spoiling for enjoying a hard time.

This is the country of the tundra (ball field marshes), interspersed with forest areas. It is a paradise in lovely flowers—lilies of the valley, iris, rhododendron, wild roses, violets, and scores of others. From a distance, so thick are the golden iris, they give the vision of a carpet of gold; while in other instances, the fields of violets, seen from afar, give the delusion of a deep blue lake.

Life on the Great Steps.

The word is spelled in the Slaf language thus, cten, but is pronounced step. The usual "steppe" is a French dog's tail addition of the useless "pe." The Gauls ruin their own language by attempting to Frenchify the national words of other nations. Cten in Russia means a heath or common. The nom-de-guerre of a brainy Russian writer, Stepniak, means a dweller of the heath (just as Cibiriak means a dweller in Cibiria). We can best translate stepniak into our own "commoner."

The Cibirian ctenc, or steps, are vaster than our American plains. The biggest in western Cibiria is a couple of thousand verstas across—say, 1,300 miles. Even a report on the practicability of preparing a topographic survey thereof, occupied me three months—that being the time spent in crossing and making an amply personal acquaintance with the region.

It is often interesting, with salt lake views, gently undulating surfaces, and ofttimes much stunted forest growths. The trees have never reached any appreciable height, due to the lack of hill obstructions to protect them from the glacial blasts of the arctic zone. In midwinter snow-white hares abound on this step—so white, it is difficult to distinguish them on the eternal six months of snow.

The survey worked across the step solely during the winter months—January-March. The weather was fine nearly the whole of the time—day after day, week after week, glorious sunny weather; cloudless, intensely blue skies; an extreme dry cold (varying from 15 to 35 degrees below centigrade—maximum recorded: 52 degrees: equal 58 below Fahrenheit). The parhelion, on the colder days, is seen in all its prismatic-colored splendor, suffusing the heavens, appearing for a couple of hours any time between 10 A. M. and 3 P. M. Of course it cannot be seen if clouds obstruct the view.

A SECTION OF THE LONG HIGHWAY.

I had some of the roughest knockouts in my life during that wintry inspection of the great cten and its railroad construction, yet the souvenir remains of happy memory. You forget about the nippy cold, the mosquito-like frost bites, the anxiety of going astray in the trackless low-grown forests, when the fear of having lost all sense of direction is sufficient to give you a cold sweat, despite the rigorous weather. It is well we can overlook the unpleasantries of past efforts.

In summer this great expanse of step is almost withered up under the hot blasts of the short Cibiria summer; mosquitoes (called komari) are there in trillions, and the evaporating salt marshes decompose the air with rotten odors. Some of those salt lakes have warm springs within them, and even in midwinter did I see them unfrozen, and at a distance of a couple of miles was the air polluted with the stench of sulphuretted hydrogen. So the fumes in the warm summer can be imagined!

What It is Like to be Lost in the Great Cibirian Forest.

Only one such experience had I, but that was sufficient! It was a few weeks before Christmas, '97, in the heart of central Cibiria. The snows for weeks had been deep on the ground, and on this morning, Sunday, 17th (29) November, there was no sun, but a slight flakestorm, which promised to "improve worse." I had quitted the house on the railroad of the engineer Tep-Obakimof—(he comes from the Kabkaz)—and had to reach another engineer's house that evening. No trains were running on this yet incomplete section, and I had to see some bridges here and there en route; and was told of a "short cut" through the forest to the first bridge, some eight miles off. It would save "a couple of miles"—as I was going through the forest on foot.

That (nearly) fatal "short cut!"—"Save a couple of miles!"—What a sarcasm!

I had plunged at good speed into the forest, taking care to follow instructions to keep to the sleigh route—or what evidences of one could be discerned in the fall-

ing snow. I was also to make a couple of turns near the end of the cross-forest walk.

Well, the snowing increased; the track was no longer discernible; here had I been almost a couple of hours plowing through the white carpet; yet no evidence of a "turn" to make or house in sight; nor the odor of one (in Cibiria, the sense of smell in the pure air becomes so keen, you can "sniff" houses, by the burning fuel, from a couple of verstas' distance); nor even the friendly bark of a dog was heard. The snappish howl of the wolf is another matter!

I did not like the looks of things! A lusty siren-shriek from my pocket-siren produced no response. Nor to repeated blows. The sounds died off in the eternal forests; but I heard something—a tantalizing something—yet nothing: the peculiar sound of "ringing nothingness" (to coin an expression) which falls on the ears when you find yourself alone in dead silence.

Had I passed the "turn?" Better, in any case, I thought, retrace steps, dispiriting as it is to have to do so—that would be better than continuing further into the unknown.

After five minutes' cogitation I turned to retrace steps, proceeded a few hundred yards, when, lo! if the falling snow and moaning winds hadn't completely obliterated my recent footsteps! Another couple hundred yards "probing" here and there, and I had lost all sense of direction. A pretty mess! Now commenced that moment of anxiety which distresses the entire physique.

But I did not lose my senses, nor start to run off, first one direction, then another. I had a pocket compass with me—not for traveling purposes, but the natural component of a surveying engineer's kit. Out it came; the cap-glass had been broken and lost some weeks before; and the needle fell out on to the snow. Supposing I had not observed it fall, and it had disappeared in the soft snow! Probably I should not be here to-day writing this!

The cold was so trying, and my fingers so numbed, I could scarce replace the needle. But I soon got bearings; knew that if I struck across forest north, the building railroad would be reached; but the difficulty was to penetrate the virgin forest for three or four miles—the assumed distance to the route of the now-completed railway.

Those Cibirian forests are a sight! I had read about them before proceeding to the country, and regarded the description given of them as another of those "travelers' yarns." ["All travelers are liars,"—Asiatic proverb.] But now for months I had been among them, and thought otherwise.

So densely timbered are the forests, the eye cannot penetrate more than a dozen feet. The trees stand upright like so many poles, and so close together that the agricultural college-reared forester would be disposed to exclaim "impossible! they could not get sufficient nutrition from the soil." At noon the "light" in that forest is only equal to twilight; for the sun can never be seen except from the treetops. A man can dodge the trees through those forests, but I doubt if a horse could.

So it was this kind of fopçt (pronounced forçt) that I conjured with for an hour, with an almost sweating—despite the cold—anxiety as to errors of compass in this northern latitude; the chance of having to negotiate almost impassable barriers and crevices (leaping or rounding the fallen timber was exercise enough!). Every ten minutes or so I referred to the compass, despite its inconvenience with the broken glass. This prevented my attaching it to lapel of coat, for fear of losing the needle.

After an hour of this, with, fortunately, no meeting of prowling big game—which would easily have made game of me in my unpreparedness—the forest became clearer. I knew what that meant, and in the distance could be seen the railroad embankment earthworks. Welcome sight!

A "short cut" indeed! Half the day had passed with only a real progress of about three miles; and the enervating anxiety seemed to knock me up for the rest of that day.

"Short cuts" in an unknown country are best if sacrificed to the "long way round." It was a prospective "short cut" on the Rigi, in Helvetia, that almost cost me my life in the fall of 1890. That particular short cut led down a steep slope, and I did not perceive through the undergrowth the brink of a precipice. Ere I knew anything, I was shooting like a log over the ledge; but with that instinct of self-preservation innate in us all, I grasped at something. These were the roots of the shrubs on the bank. They held! As the earth was disintegrating about them, I worked myself up and grasped the branches and pulled myself on the bank again, "in a twinkling."

Some human bones in some rotting clothing might have been found at the foot of that precipice by rare-flower gatherers a couple of years later. Coroner's inquest: unidentified.

Sleigh Driving—A Lovable Little Custom of Etiquet.

Whenever you are invited out to a sleigh drive with a lady friend in Cibiria, don't forget that propriety requires that you, being a masculine, and a supposed protector, should, once in the sleigh, and seated, proceed to slip your arm round your lady friend's waist; and, as the sleigh whirls along over the snow ice, and sundry jolts are experienced, you encircle your arm more and more, with an occasional half hug as the sleigh lunges more than usual in its rapid flight on the wings of the wind. That protective waist-encircling arm is to prevent the lady rider being thrown out—of course, of course!

Roads in Cibiria—The Longest Made Highway on Earth.

As already pointed out by the writer in "Roads of the World," in the Manhattan Automobile Magazine, and "Cibirian Roads" in the New York Good Roads Magazine, the longest made highway on the globe is the great Russian-Cibirian posting road stretching from the heart of the Iabloni range, in eastern trans-Baikalia, to the Vistula, on the old Polonia republic frontier. Total distance: turning 5,000 miles.

In parts the road is accidentally good, due to the firmness of the binding materials which happened to be there, and rarely to the efforts of the road builder. It is not in a Russian to build a good road. They had no original ideas as to how they should build first-class roads, so their engineers read up about and copied the French-made roads. France possesses the best *chemins* in the universe: that I know personally by long tours over them, especially the great highway of central France known as the route de Toulouse, and extending (officially) from Paris to the capital city of the south. In parts it is actually "smooth as a billiard table" almost, and you nearly feel disposed to try to take a slide on it, as on ice. I described at length this and other highways in Municipal Engineering, Indianapolis, in one of the summer issues of '92.

But unfortunately the Russian dopora (pronounced doroga) builders followed the French system in slip-shod fashion. When Telford and Macadam (who originated nothing, or little) copied French road layers—to which their names erroneously cling—they faithfully "followed instructions"; hence the success with which they perpetuated their names as if they were the original inventors. The Russ, on the other hand, sacrificed the roads to the exigencies of the contract system, in which every interested party thought, not of the road, but of his pocket. Even the "kontrolers," who were officially deputed to see that the contractors did not skimp their work, accepted the bribes of the latter, and passed the work. In Russia there is no such thing as patriotism; they give a cynical smile when the word is brought up, and, slapping their pant pocket, exclaim: "Here is the extent of my patriotism. This is the limit of our 'patriotism' [another slap]. We Russians spell it 'kapmahicm' [lit., 'pocketism']. Since we are badly paid, we steal all we honestly can."

Singular how this entire world is a question of pocket! Those Slaf "kohtpaktopc" (pronounced "kontraktors") in Cibiria are not isolated cases—not at all! And I could not help respecting them for the openness with which they admitted there was no patriotism in money matters; that they drew the line of patriotism at and including "kapmahicm" (which they pronounce "karmanism")—i.e., "pocketism."

It will be noticed that I continue to give instances of the difficult Russian spelling, and the examples (in parentheses) where the pronunciation is often totally different from the spelling. This is not an original idea with me: it is a copy of the plan sometimes followed during the publication of George Kennan's "Cibirian Prisons and the Exile System" in the Century. The editor thereof received so many inquiries how the Russian words should be pronounced, that he requested the author of the papers to, here and there, interpolate examples of Russian pronunciations.

The Good Results of the Kennan-"Century" Mission.

Dozens of times have I pointed out in different class papers, in special articles on Cibiria (particularly in the N. Y. Medical News, the Manhattan Book-Lover, Railway and Locomotive Engineering, etc.), the good results of the Kennan-Century mission on Cibirian prisons and the exile system. Now I will repeat the information for the benefit of the readers of this journal.

The Kennan exposures did a lot of good—although, of course, you will not get a Russian official to admit that it was due to the Kennan exposé that the prisons have improved. I was through various of them, and did not fail to notice the scrupulous cleanliness of the places. Even the old time-stained etanc (pronounced étaps), or half-way prisons, were as clean as old buildings can be made by a vigorous application of bass brooms and buckets of water. Why, in some instances, the floors were even cleaner than the interior window sills—which ledges the inmates had found useful for the reception of cigarette stumps, lemon peel, bits of bread, etc.

Your correspondent was through the prisons without any permit, so the expression "saw him coming" cannot be applied. In this wise: Putting up in the villages with the prison medicos, they naturally wanted to "show me the sights." So isolated are they, so few their visitors, they are glad to have somebody stay with them a couple of days. In the aggregate, during the trans-Cibirian journey, they almost forced me to be out of schedule a couple of months in reaching the Ural mountains, due to pressing me to "stop a day longer" in their "ruf-and-tuf" but hospitable log houses.

And not alone did Kennan's writings spring a little shame into the prison authorities, and cause them to adopt some of his suggestions: the military authorities—knowingly or unconsciously—"saw they were good," and actually introduced some of the Kennan ideas into the military transport service. Example: The most salient one was the American writer's showing how prisoners could be more economically carried by telera (pronounced telega), or wagon, to their destination in Cibiria, than being made to "foot it." And the writer actually saw able-bodied young soldiers—who would have been better for pechkom (walking)—being transported across Cibiria to their respective stations in telegas.

Kennan is a faithful pen portrayist, unsensational in the extreme, although writing (as on the Cibirian prisons) on what was then a matter often revoltingly sensational where the truth had to be told. If anything, things were even worse than Kennan made them out to be. My informants were prison officials who had perused the Century articles (circulated clandestinely), and found their envoy had understated matters. Naturally, some care was taken that the Yank investigator should not see everything—and that, of course, certainly not the best.

It is pretty safe to say that more educated Russians have read the Kennan writings from beginning to end, than have done as much with the Bible. The reason for this was, it goes without saying, because the writings were suppressed.

There is a Franco-Russian official excusist named de Windt, whose apologetic effusion on Cibirian prisons can naturally circulate all over Russiadom, but I only met one Russian who had ever perused it—and that only a perusal of a few chapters. This wind(t)y write-up has remained as dead as ditch water—like the vaporings of another imaginative juvenile tenderloin, the notorious Landor (known as "the little Munchausen"), whose Tibetan "horrible cruelties and atrocious tortures" were, with their precocious originator, effectually pilloried recently in one of our critical literary reviews under the title of "The Landor Imposture."

I wrote to the Century at the time from Tomck, west-central Cibiria, offering a paper on the improved state of prison conditions, and received a courteous reply, declining. Queer that a magazine should negative the offer of an article showing the good results of its own mission!

Some Hints for Possible Future Sportsmen in Cibiria.

Take along a pocket French-Russian and Russian-French lexicon, bound in two vols., not in one. Or, for second choice, a German-Russian or American-Russian one, according to the language with which you are most familiar. Thus equipped, you have no need of an interpreter.

Have plenty of patience. Remember the officials who ask you for your papers, and cause you delay, are only carrying out their instructions. Impatience will do you no good. Humor the Russian a bit, and you will find him a good-enough fellow; be just to him, but don't be "generous"—i. e., don't tip! Once you begin the tipping business, you will have to go through a whole lot of tipping. For my own part, I never "tipped" a single konek (pronounced kopek) or cent between the Pacific Ocean and the ancient Polonia republic. How did I do it? By not beginning.

Cibirian society and dinner parties imbibe overmuch of bodka (pronounced fodka)—67 per cent. alcohol. As you value your self-respect, avoid it, except possibly a sip after meals. The native way is to gulp down a small glass of the ardent stuff before the repast, consequently on an empty stomach. Even if you are used to alcoholic drinks, that fodka, taken à la Russe, will do you harm both physically, intellectually and socially.

The Russ may take offense at your refusing his schnaps—but never mind! Which is most important—your health or the opinion of your host? Be firm, and inform your acquaintance you are a temperance man. He will understand this, since he is accustomed to people whose religion forbids the use of intoxicants.

A Bankrupt Empire.

Russia is the nearest approach the world has to-day to a bankrupt empire. Everything is run at a loss. The only money coming in is in the form of loans raised in France, Germany, etc. Even the gathering of the taxes is performed at an economic loss. Although, under the guise of military service, the government extracts five years of servitude from the able-bodied male population, still the service is had at a heavy loss—since naturally every unwilling slave tries to do the least he can. The population literally live on each other—two-thirds being consumers, and the other third (the submerged tenth) producing and existing merely. The observant tourist cannot but fail to see how the whole empire is run at a heavy loss. The curse of officialism and paternalism and poverty is everywhere rampant.

And so things will go from bad to worse, till Russia exercises the "divine right" of hard-up nations—i.e., repudiation.

Quite right!

L. Lodian.

[TO BE CONTINUED.]

Tales of the Frontier.

VI.—Jim Morehead's Military Expedition.

Not in the pages of Motley or Bancroft will this record be found. Gibbon is silent concerning it, and the reports of U. S. Army officers may be vainly searched for any mention of it.

And Jim was not the commander-in-chief, either, but only a private in the ranks; yet this shall be known as Jim's expedition, for he was the only one of this band of frontier warriors known to me; and though not general-in-chief of this prairie army, he might well have been, save for the native modesty so strongly characteristic of him.

Dear, brave, kind-hearted old Jim! Long since gone to his reward; a truer Leatherstocking of the frontier never crossed over the Great Divide!

By the light of the open fireplace in the lonely trappers' cabin near the Great Bend of the Des Moines River, we finished up the evening's work of dressing fur, while Jim poured into my willing ear one of the many tales of savage slaughter, the recollection of which renders it difficult even at this distant day for an old timer of the frontier to think charitably of the villainous Sioux.

The Minnesota frontier seemed peculiarly unfortunate. Only with the greatest reluctance did the savage Sioux relinquish their hold upon this best of all their hunting grounds, and for years of its early occupation by the white race strong war parties raided the comparatively defenseless border, and a ferocious baptism of fire and blood awaited many of the venturesome bands of pioneers as the infant settlements crept further and further into the debatable country between the hostile races.

Among other tales of similar suffering and sorrow the legends of the border told of the Spirit Lake Massacre; the Norwegian Massacre, and the Great Massacre—or Sioux War.

Along the left bank of the Des Moines River, southwest of Fish Lake, a colony of Norwegian people established their homes in the then wilderness country, and by patient industry had become comfortably independent.

For years of peaceful occupation the little settlement slumbered in security and peace. Other colonies along the border struggled for existence, but the happy valley of the Norwegian colony slept secure! although for years this was the furthest out in the wilderness of any on this part of the border line.

Around Spirit Lake quite a number of settlers were established, and along the Des Moines River, near the present town of Estherville, a strong colony was located. My old friend Jim lived a few miles north of Estherville on the west bank of the Des Moines.

The time was just before the great War of the Rebellion, but the precise year I have forgotten. Suddenly as the rush of the Bengal tiger, the peaceful valley of the

Norwegian colony was enveloped in blood and fire; and when first I saw the ruins of the little settlement only the weed-grown fields and crumbling fences identified the stricken place.

Choosing the quiet of a summer Sunday morning, when many of the adult population were assembled for religious worship, the cowardly wretches made their first attack upon the women and children remaining at their homes, and when the uproar had stampeded the assembled congregation, many a bloody trail through adjacent cornfields bore awful witness of unavailing flight on the part of the unarmed worshippers.

Owing to the high vegetation of the fields surrounding their houses, many succeeded in escaping from their foes, carrying terror and apprehension to other exposed settlements along the line.

Overwhelmed with terror at the awful suddenness of the assault, some gave up without a struggle and died like curs. One man, who had gone to meeting, sprang into his wagon and drove away, leaving his family to their fate. Another ran homeward and, approaching his house under the cover of his cornfield, reached home just after the murderous wretches had departed, and found among his slaughtered family two little boys of some three or four years of age, who gave some sign of life.

In their ferocious haste the savage brutes had tried to dash out the brains of the little ones on top of the cook stove, but though horribly beaten, the little boys were still alive. Taking one under each arm he ran down through the cornfield toward the river, and before sunrise of the following morning staggered into the little settlement at Spirit Lake, Iowa, and laid down his precious burden, twenty-five miles from where he first took it up.

Let any man on this green earth—Sandow not excepted—try carrying such a burden as the limp bodies of two little children, of a probable 100 pounds weight, for a distance of 25 miles in 18 hours!

As Mrs. Stowe says of the flight of Eliza in Uncle Tom's Cabin: "Sublime is the dominion of the mind over the body, that can, for the moment, make the weak appear so mighty."

One of the children died in the father's arms—all unknown to the fleeing fugitive—and one lived and recovered completely.

When the escaped fugitives had told their several tales, it was found that no report whatever came concerning two Norwegian families located at the extreme northern end of the little settlement; and the uncertainty concerning their fate aroused the men of the frontier and led to the forming of the expedition, of which this tale is the chronicle. Mounted couriers scoured the country, calling out each and every man, and 25 men were quickly assembled at Estherville, and an equal number at Spirit Lake, and hurrying forward they joined forces at Jackson, and together marched up the left bank of the Des Moines on their errand of mercy, to save any possible survivors of the massacre and to bury the dead.

It was a motley force. Some were mounted and others on foot, with little pretense of military order in their march, and with any and all kinds of firearms possible to obtain. Hardly had they joined forces and commenced their forward movement, when from some all unknown locality, came a mounted man riding up in front, where, calling a halt, he pompously announced: "I am Mr. So and So, Lieut.-Colonel of the United States Army. I have come to take command of this expedition, and you are all under my orders!"

For a moment the little army of pioneers staggered under the grandiloquent announcement; but quickly sizing the fellow up, they marched on, and he, after riding up and down the line bawling out orders, to which no one paid the slightest attention, finally subsided and took his place in line, and made a pretty good volunteer soldier. Reaching the house where the Norwegian people had been gathered for worship on that fateful Sunday morning, they halted, and collecting and burying the scattered victims of the bloody foray they hurried on to learn the fate of the two families from whom no tidings had yet come.

As a band of horsemen were deployed in their march through a belt of timber, they suddenly started a gigantic Norwegian fugitive, who had escaped the massacre and remained hidden in the woods, and who, taking instant alarm at the approaching horsemen, rose from a thicket and bounded off like a startled buck.

Three mounted men raced in hot pursuit of the frightened fugitive, yelling out to him to stop—that they were friends—but he only ran the harder, and finally turning down into a slough, where the pursuing horses floundered in a vain attempt at crossing, gave them the slip and disappeared in the woods.

A mile or two further on all were rejoiced to come suddenly upon the house where the two families were gathered, still "holding the fort," and still keeping watch and ward in the hope of coming succor. At the time of the massacre the husband and father of one family, having gone alone to the meeting, fell among the first of the victims; and when the awful outcry of the massacre reached the ears of his wife, she quickly gathered her children and ran with them to the house of the neighbor, who, fortunately, proved to be a man of courage, and, who, gathering his own and his neighbor's family into his log house, the heavy walls of which were bullet proof, barricaded the doors and prepared for defense.

A careful search revealed but three cartridges for his gun, and just as this discovery was made, a voice was heard in English calling upon him from a brushy ravine just back of the house, and demanding an immediate surrender. Shouting defiance and daring the whole Sioux nation to the attack, the brave Norwegian ran upstairs and began knocking out the plaster and the wooden blocks which formed the "chinking" between the house logs near the roof, thinking that from that height he could command the enemy's position in the ravine. As the sound of his blows, followed by the falling mortar on the outside of the house revealed his position, a volley from half a dozen guns smashed into the logs in front of him, sending the dried mortar in a cloud of dust into his face, but fortunately without hitting him.

He now ran down stairs, and making what demonstrations he could at one of the windows fronting the ravine—but without exposing himself—he at length succeeded in again drawing a volley from the Indians' guns, which sent the glass flying in all directions. Springing to the window, he fired into the smoke of his enemy's guns, and evidently with effect; for the attack ceased immediately; nor did he afterward note the slightest indication of the presence of his foes. And until the coming of Jim and his friends five days afterward the little group of pioneers remained barricaded, keeping watch night and day.

Jim said that of all the glad and grateful people he ever saw, they certainly headed the list.

As the little army bivouacked here for the night, they were given the free use of all the farm produced, and the vegetables, chickens and pigs of the grateful Norwegians furnished materials for a feast which lasted until nearly midnight.

As night drew on guards were stationed around the camp at quite a distance, and as the little army was composed of two equal bands, each still under its own captain, each detachment furnished guards for half of the circle around the camp.

About ten in the evening, as the feasting went merrily on around the camp-fires, from out a clump of bushes close to the camp-fires suddenly arose a tall form, and stalking forward into the firelight, revealed the big Norwegian, whom the horsemen had raced so furiously during the day. He had watched the arrival of the white men from the edge of the neighboring woods, and had witnessed the rapturous greeting they had met from the imprisoned people; yet so overpowering was the panic fear which possessed him, that he dared not trust his own eyes; and not until he had crept forward in the darkness and finally overheard the Norwegian people conversing in his own mother tongue, did he dare reveal himself.

He now seated himself by the fire and told his story of what he had witnessed of the slaughter of his people, ending with an account of how he himself had that very day been furiously chased by three mounted Indians, who, yelling frightfully along his trail, almost overtook him when he ran down through a slough where the horses of the Indians were mired down until he had finally made his escape.

In vain did the pioneers try to explain the true situation, pointing out to him the very men who had tried so hard to catch him. Not a bit of it! He knew they were Indians—had had too close a look at them to be mistaken—and in spite of their assertion remained unconvinced.

At midnight, when all in the camp were asleep, the guard was relieved by a new detail, and suddenly from a point on the guard line came the report of a gun, quickly followed by others half way around the camp.

In a panic of fright and confusion half the camp sprang to its feet in haste to seize weapons and repel attack; and not until the whole outfit was in uproar was it finally understood that one talented captain had evolved from his own inner consciousness a peculiarly idiotic system of tactics, and without explaining the matter to any others of the force, directed his own half of the guard just relieved, to fire off their guns in a half circle around the camp.

When the smart Aleck performance was finally understood, and the echoes of the consequent profanity had died away in the distance, the little army again lay down to rest, and the night passed without further incident.

In the morning the return march was begun, and the little handful of survivors of the fated Norwegian colony safely escorted back to civilization, when the little army of frontier warriors melted away as quickly as at the call of mercy it had assembled.

But of the abundant and all unnamable evidences of fiendish ferocity inflicted on the women and children of this devoted Wyoming of the West I cannot write.

ORIN BELKNAP.

William K. Moody ("Special").

From the Boston Herald, Nov. 16.

MR. WILLIAM K. MOODY, editor of the "Market Specials" in the Herald, died at the City Hospital at 10 o'clock last night at the age of sixty-two. Mr. Moody had suffered for years from an internal, constitutional weakness, which developed phases which compelled him to quit his desk on Saturday, Oct. 26, never to return to it. The disease baffled the skill of the family and consulting physicians, who, as a last resort, recommended a surgical operation, which was performed Nov. 6 at the City Hospital. The result failed to meet expectations, and his active and useful life was brought to a close.

William K. Moody was born in the town of Strong, Me., April 19, 1840. He was the oldest son of Dea. John Moody, well known in Oxford county. The elder Moody was for years employed by William King, the first Governor of the State of Maine, and naturally his first-born was named after that distinguished citizen. He was educated in the public schools and at Hebron Academy and Waterville College, now Colby University.

He taught school for a time, but shortly after leaving college entered the newspaper business as the editor and publisher of the Winthrop Gazette, a weekly newspaper established by him at Winthrop, Me. After spending two years in that town, he removed to Mechanic Falls, where he established the Androscoggin Herald He remained here four years, and then, taking advantage of a favorable opportunity, purchased a half interest in the Somerset Reporter, upblished at Skowhegan. Later he purchased his partner's interest, and for a time was sole owner.

In 1875 Mr. Moody sold the paper to Messrs. Kilby & Woodbury, and came to Boston, where for a time he acted as editor of the Weekly Advertiser. Later he was publisher of the Woman's Journal, with which publication he was connected for several years. While connected with that paper his attention was directed toward commercial affairs, for which he had a natural aptitude, and for a short time he filled a responsible position on the Boston Commercial Bulletin.

About this time he wrote a series of articles for the Herald on Boston banking methods, which attracted wide attention, and secured him recognition upon the regular staff. Under his direction the market specials department was started, and early grew into a position of widespread influence and importance.

Mr. Moody was also a frequent contributor to other departments of the paper, his articles always being valuable and interesting. He was particularly interested in everything pertaining to hunting and fishing, especially in his native State, and his vacations were always spent at this favorite recreation. For many years he had a camp on Richardson Lake, in the Rangeley region, until failing health led him to dispose of it.

In this connection he was widely known among sportsmen, and was a recognized authority upon matters connected with the rod and gun. He took a deep interest in amending the laws of Maine for the preservation of game and regulating the taking of the same. He was a frequent contributor of articles to the Herald during the fishing season, and was also a regular correspondent of FOREST AND STREAM.

Mr. Moody was a lover of nature in art and left many photographs of wood and water and mountain scenes, taken by himself during vacations. He was an ardent amateur photographer, and was the inventor of several patented articles for photographers' use. He was also a builder of cameras for his own use, being skilled in metal and wood work.

Mr. Moody was respected by all with whom he came in contact in daily business and social life. Honest and upright, he could not bear to see anybody or anything oppressed, and always championed the cause of the weaker party. He will be much missed by a wide circle of friends and business associates, beside the immediate relatives.

Pacific Coast Letter.

THE death of "Old Whiskers" should have been mentioned in my last letter. This magnificent member of the red deer family had roamed the mountains near San Jose for years. Local sportsmen deemed it an experience even to have missed a shot at him. Superstition for awhile declared him to lead a charmed life. Hunter Saxe Shalton, of San Jose, while hunting in the Mt. Hamilton range, two days before the season closed, overcame the "hoodoo" and brought Old Whiskers into town. The antlers numbered eleven prongs and the deer weighed 175 pounds. The kill was a fine one, for which the lucky man should be congratulated; but the cañons of Mt. Hamilton range have been impoverished by losing their greatest incentive to hunt. We wear our inconsistent shoes out to take a big one and then deplore his death.

Senate Amendment No. 18, in relation to the division of California into fish and game districts and to be voted upon at the coming election, proposes adding to Article IV. of the State Constitution a new section that shall be known as Section 25½, and shall read as follows: "The Legislature may provide for the division of the State into fish and game districts and may enact such laws for the protection of fish and game therein as it may deem appropriate for the respective districts." County ordinance may not now lessen restraint imposed by legislature, though regulation may be enacted more stringent in its purpose, and the State laws are uniform for all sections, hence a complaint of overprotection in districts with too much game. Only a person familiar with the great variety of conditions to be confronted here, either in going from the coast inland, or the length of the State, will appreciate how difficult it is to pass measures suitable in every part, or how hard the problem for a country in which rough contour with varying degree favors production.

If adopted the amendment may yet preserve the salt-water fisheries along our sea coast. Too little attention has been given to this purpose. Avalon Bay is now nearly the only breeding water in the south protected by law from the purse netter, and it but indifferently by county ordinance, though there are many spawning places along the southern coast. Intelligent supervision in this regard would eventually mean a great deal to the Pacific States. Experience of the East might serve as warning of what will occur through neglect. As a biological laboratory will soon be established on Catalina Island, so says U. S. Fish Commissioner Geo. M. Bowers, the second on the Pacific, for the study of marine life, more practical ideas may be inculcated.

President David Starr Jordan, of Stanford, who has spent the summer at Samoa, in the interest of the U. S. Fish Commission, and is now overhauling his specimens at the university, reports that he secured upward of 600 kinds of fish, perhaps 25 per cent. of them unknown to scienice and unclassified.

The United States Government has lately withdrawn from entry 6,000,000 acres of public land, in northern California, to be divided into forest reserves as follows: Klamath River reserve, 3,780 square miles; Mt. Shasta, 3,024 square miles; Lassen Peak, 1,292 square miles; and Diamond Mountain, 822 square miles; the respective localities indicated by their names. The reservation of these vast tracts, beside the protection it will afford to timber by means of a ranger patrol, must result in preserving untold quantities of game from fire or other destructive agent, and thus will prove a boon to hunters and to students of natural history.

Great numbers of wild creatures are destroyed when the wilderness is burnt over, through asphyixation and other causes, there being often no safe refuge from speedy flame or volume of smoke even though water be reached. This was evident after the Washington forest fires of the past autumn. The surface of Woodland Lake, in Clark County, was found to be a putrid mass of bears, lions, wolves, deer, foxes, and numerous small animals, that had been driven to the water for relief, then had succumbed to heat and smoke or drowned. This destroyed country, too, it should be remembered, will be barren of forage for years to come.

The forest ranges throughout the south had prevented any fires occurring up to the time of the first winter rain, and now feel there is no longer the slightest danger. Planting barren parts of the reservations

will begin soon. Chief William L. Hall, of the Bureau of Forestry, impressed on his recent visit to the State by being shown growth four feet high from seed of the *Pinus tuberculata* sown two years ago on the north San Gabriel, has sent here C. O. Sparks, of his department, to co-operate with P. T. Lukens, of Pasadena, in further work of this kind, and declares this to be the beginning of an extensive effort toward restoring the timber. W. H. Mills, of the Southern Pacific Road, who is now drawing up a memorial to Congress setting forth the forestry conditions, will advocate liberal expenditure for this purpose.

A report that Santa Cruz Island, twenty-eight miles off the town of Santa Barbara, said to be the gem of the coast group, would soon be made a resort like Catalina, has been contradicted by the capitalists supposed to be interested, but the place must be developed in the near future. It has been merely a sheep range, and twelve thousand of the flock were slaughtered in 1876, twenty-five thousand in 1887, just for the pelts and tallow, and to reduce the number. The island is nine miles wide and thirty miles long. The eastern shore is said to be low and permit landing at many points. Western and northern sea cliffs are rich in caverns, where escaping sealions must be avoided. Sheltered coves about the island with smooth water in them, show sea gardens at great depths of brightly colored growth with brightly colored fish swimming above it. Admitted daylight into Painted Cave discloses for fifteen hundred feet back of a brilliant fresco of green, red, golden, or other surprising hue.

A number of California road-runners, with tails a foot long, appearance otherwise and their "cra-i-i-i-ks" not unlike those of the bittern, though in fact ground cuckoos, comical beyond description, for a month have been racing about the common and with passing vehicles on our streets, greatly to the amusement of all the neighbors within view, and even enter our premises to exhibit. One creature just escaped a Cooper hawk through maneuver and swift disappearance. Another has become a cripple since we first saw it. All of them understood on sight the construction of our chicken-wire fence, and either have used the gate or passed around the end. A side-hunt, to take place on Thanksgiving Day, avowedly to kill game and rid the Ojai of rabbits, beside destroying a great many larks and other attractive birds, must result in the death of many road-runners, for these tempt seriously the thoughtless hunter. Contumacious remarks or other ridicule would follow advice to the contestants.

A wild pigeon that lit immediately above our veranda on Oct. 20, the first bird of the season, escaped with magnificent speed from a shot aimed at its head. None of these creatures must stop near. Upon our arrival here we placed as drinking pool in the front yard for all kinds of birds a shapely Indian mortar, and for awhile we were grateful for the chorus of song, but the small boy with miniature rifle discovered what shooting he might have at the fearless singers and compelled us also to seek cover, for here as elsewhere, the usual coroner's jury will acquit if the murderer be careful to kill his victim through accident. Shots of hunters in the cañon near our yard, neighbors tell us, one season made life very uncertain about these premises, hence pigeons must be destroyed—or scared off. The flocks this year appeared in the valley three days before the first rain.

H. R. STEIGER.

NORDHOFF, Cal.

The Record of the Old Missouri.

FORT ATKINSON, Wis., Nov. 14.—*Editor Forest and Stream:* A recent number of the FOREST AND STREAM gave an interesting account of the finding of a stone in North Dakota, marked with the names of a number of old trappers and hunters who ranged that region in the days long gone by.

Thinking it would interest an old friend of mine, Mr. Theodore Louis, of Louisville, Wis., who was in the employ of the American Fur Company as a hunter and scout in the early fifties, I sent him a copy of the paper. Mr. Louis is a German, and one of the rare old type. He was hunter and scout for the Prince of Nassau, who spent five years, I believe, in hunting large game on the plains about 1853 or '54. Mr. Louis for a number of years has been one of the most noted and skillful breeders of swine in the United States, and he is full of most interesting reminiscences of the days when the Indian and the buffalo held joint sway over all of that region west of the Missouri.

I send you his letter, in which you will note he recalls one of the names inscribed on the stone. I do this, thinking that it may be of interest to you.

W. D. HOARD.

Mr. Louis' letter to Mr. Hoard, dated Nov. 12, 1902, reads as follows:

Dear Sir: Your postal card and marked copy of FOREST AND STREAM came duly to hand. Yes, it recalls years of yore in a land where we were monarchs of all we surveyed, no matter how broad the vision from the mountain's dizzy heights. I recall the name McCarthy. I met him in Fort Pierre, and later once at Fort Union, both old posts on the Missouri River. Like myself, he was in the service of the American Fur Company. I met him in 1852, but I was stationed at Old Fort John, below Fort Laramie, and my field of operations was southwest of there, with the Arapahoe and Cheyenne tribes in Colorado Territory, where the city of Denver stands to-day.

We boys had a habit of scratching our initials or names on any smooth-faced prominent rock, but I should think that before this time would have wiped out all these records.

I have a few relics left. The pipe and kinikinnick pouch that Mimilusa, a chief of the Cheyennes, gave me on Cherry Creek, in a winter camp, near where the city of Denver now is; a pair of moccasins and a few other trinkets; and my young ones sometimes say, "Father, you know you willed to me that powder horn made out of buffalo horn," or this or that.

While I was reading the story of this stone it drew my thoughts away from the gloomy and lonesome part of life.

With best wishes, your friend, THEO. LOUIS.

Natural History.

How to Attract the Birds.*

IN his report on "Insect Enemies of the Spruce in the Northeast," Dr. A. D. Hopkins says that, "In hundreds of infested trees examined, at least one-half of the beetles and their young had been destroyed by birds, and in many cases it was evident that even a greater proportion had perished from this cause alone." These beetles are able to overcome the resistance of a healthy living tree only when present in large numbers, and Dr. Hopkins estimates that on an average infested tree one hundred beetles exist for each square foot of the bark. As an average tree has about sixty square feet of infested bark, it may support 6,000 individual beetles. This gives some notion of the number of possible insects in an infested spruce forest. The destruction of our woods by unchecked work of such insect pests is enormously costly, and only the birds can protect us from this loss.

In summer, when bird life is most numerous, when the young are being reared, the food of the bird is almost wholly insects, and the value of their services to gardener and farmer is so very great that it cannot be computed. The statement that a few years of unchecked ravages of insects would render the earth uninhabitable is no doubt true.

The value of birds' services to mankind, how to bring them close to our homes, and a number of other interesting talks about bird neighbors, form the subject of a new volume by Neltje Blanchan, whose books, "Bird Neighbors," "Birds which Hunt and are Hunted" and "Nature's Garden," have had so wide and so well-deserved a popularity. The subjects treated are, "How to Invite Bird Neighbors," "The Ruby Throat's Caterers," "Bird Architecture," "Home Life," "Nature's First Law," "Songs Without Words," "Why Birds Come and Go," "What Birds Do for Us" and "Some Naturalized Foreigners."

To those who are familiar with the author's happy style, little need be said concerning the pleasing presentation of the various subjects which make up the book. In its matter, its illustrations, and its admirable mechanical construction, it is extremely attractive. In the eighth chapter, in which we are told "What Birds Do for Us," an interesting review is given of the division of the labor of insect destruction among the different groups. Thus: "One class of tireless workers is bidden to sweep the air, and keep down the very small gauzy-winged pests such as mosquitoes, gnats and midges. Swallows dart and skim about shallow water, fields, and marshes; purple martins circle about our gardens; swifts around the roofs of our houses, night hawks and whippoorwills through the open country, all plying the air for hours at a time." A little lower down, the large family of the flycatchers, including king birds, peewees and their allies, stand as sentries at various points, snapping up each luckless insect which shows itself, and thus do their share. To the tribe of the warblers and the vireos has been assigned the duty of taking care of the twigs at the extreme ends of the branches of trees and shrubs. They go over them with care and the vireos even inspect the under sides of the leaves, so that none of the insects may get away. These tiny birds deal only with the smaller forms of insect life. The thrushes, bluebirds, robins, mockingbirds, catbirds, thrashers, wrens, orioles and tanagers are searching for food all day long during the whole of their stay, dealing with the larger insects, and, while helping themselves, are helping us as well. As many birds will not eat the large hairy caterpillars, they seem to have been turned over to the cuckoos, who may often be seen at work about the nests of the tent caterpillars, which disfigure the apple tree and the wild cherry.

The woodpeckers are the great enemies of the beetles about which Dr. Hopkins writes, but they have faithful allies in those tiny little birds which spend the season of cold climbing up and down tree trunks and hunting along their branches for the eggs and cocoons of the insects which next spring are to do their pernicious work. Nuthatches, brown creepers, titmice and kinglets are the little fellows that by their destruction of insect eggs perhaps do as much good as any other birds.

When the sparrows at the end of the summer have finished the work of feeding their young on insects, they find the harmful weed seeds beginning to ripen and feed on them. Many of them stay with us all winter, and all through the season are at work at seed eating, just as the chickadees are at insect egg eating.

It is interesting to learn that a peach grower in Georgia has so high an appreciation of the value of the purple martin in keeping down the curculio beetle that he has set up on poles all around his orchards, gourds for the martins to nest in. They do nest in them, and well do they pay their rent.

Hawks and owls are shown to be far more useful than harmful, and vultures and gulls and terns each to do their various works in helping to make life pleasanter and easier for us to live.

The book is full of information most attractively presented, and is beautiful in illustrations and make-up. Though the pictures are mostly of the smaller birds, there are included woodcock, grouse and very many pictures of nests and nesting sites.

The Pronghorn's Horn Sheaths.

Editor Forest and Stream:

Exact observations on the shedding of the horn sheaths in prong-horned antelope, made upon the same individual through a series of years, are so scarce, that the following note will doubtless interest many readers:

On Oct. 29, 1899, a fine buck antelope, apparently about four years old, was received at the Zoological Gardens from North Dakota. A few days after arrival, it shed the horns it was then carrying, 7¼ inches in length on the exterior curve. It shed again about the same period in 1900, this pair measuring 9½ inches. On Nov. 1, 1901, and Nov. 3 and 4, 1902, the process was repeated, both of these pairs being about 11 inches long. The animal remains in perfect condition and health, and it is my hope that it may live to add to the series.

In December, 1901, three other bucks were received, one being a kid with horns an inch or so long, which were dropped about the middle of the month. The two others appeared to be three years old. One of them shed horns 8 inches long on Nov. 5, 1902; the other on Nov. 9, the horns in this case measuring but 6½ inches, and having a strong outward inclination, both in the horn-sheaths and covers.

Every observed fact so far indicates that the shedding is a regular annual occurrence, but so few observations have been recorded from those in a wild state, that room is still left for the possibility that it may not always occur in each individual with exact regularity—as is now known to be the case with some species of deer. I may add that I once saw a fine head of a freshly killed buck early in November, on which the sheaths were loose and about ready to drop off.

ARTHUR ERWIN BROWN.

ZOOLOGICAL GARDENS, Philadelpaia, Nov. 11.

[Mr. Brown's observations on the horns of the prong-horned antelope are interesting, and it is desirable that others who have the opportunity should make similar observations on this species now growing so rare.

The testimony of the old-time Western hunters is practically universal that in buck antelopes killed in November or December, the horn sheaths are always either loose or recently shed. More than once, when taking a buck by the horn to turn him over or drag him to a more convenient place for attention, we have had the horn sheaths come off in the hand, and a friend told us of a case where, havig shot a buck antelope, he found on going up to him that the horn sheaths had become loosened and had partly slipped off as the animal fell.]

How Do They Know?

THE instinct whereby wild creatures detect those of the human species who are likely to be hostile to them, and those who may be regarded as harmless, is of so subtle a quality that it almost appears to partake of the nature of metaphysics. Rooks will follow and feed at the very tail of the plow, and will take wing if a passer-by but lifts a stick to his shoulder as if it were a gun. These same rooks are unmolested by fire arms all the year round, save for some forty-eight hours of spring rook shooting, and even that persecution does not pursue them in the open fields, but when it does occur it invades their homesteads, and assails them from under the foliage of their actual domiciles. In the nesting season plovers will actually buffet the angler who is fishing too close to their broods; but by the date of the shooting season they would not allow him to get within two fields of them. The woodpigeon seems to know exactly the range of the modern fowling-piece, and will flash boldly past at an interval of 100 yards and upward, but is careful quickly to put a tree between himself and a sportsman if disturbed at any range within gunshot. The fox knows that he is sacred from guns, and will sometimes stand by and watch a covert beaten, and will audaciously seize a fallen pheasant and decamp with it within twenty paces of a retriever; he is quite aware that the latter is no foxhound. The wild ducks on the Thames seem to have fully mastered sections of the Thames Act of sixteen years ago, and to have abandoned their former shyness, in view of the statutory protection now awarded to them against prowling gunshot from boating parties. They will turn out to take stock of the practice of a university crew on Henley or Nuneham reaches, and rock serenely in mid-stream to the swell of a coaching launch that rushes past them; nor do they acknowledge any panic at the sound of a megaphone.

In the current partridge season many a covey will continue to breakfast on the stubble undismayed by the plow and team that are at work breaking up that same stubble only sixty yards away, and they will treat with contempt the voice of the teamster addressing the team at the turns; but let a party of guns enter that stubble at the far end, well out of shot, and hold an injudicious council of war, sotto voce, or let an inconsiderate keeper rate his dog loudly with "'ware fence" as the party climb the first hedge, and the old cock will sound the alarm and the birds be flushed and away well out of shot. How is it that the big game, as also the large carnivora that prey upon them, retreat long before they are exterminated from African pastures that are within touch of white men's settlements, though they had tolerated the society of the colored races for centuries in the same district? Why is it that the song bird flits within range of shot in careless confidence, while the game that is sought for is so shy? Not even the sound of a volley from the advancing line at a flushed covey seems to disturb the nerves of the larks on the stubble; they know that the hurly-burly is not directed at them, and they are content to move on a few paces, then settle again as calm as old artillery horses on a review day. Whence is the telepathy in fish that in a season or two, or less, in some hitherto unfished continental trout stream, alters the temper of the whole stock in the river, and teaches them to be shy, even though not one-tenth of them have ever seen the lure of the British lessee who has come to whip the water, and not one-thirtieth of them have been pricked? How is it that wild fowl at a decoy will tolerate the smell of a piece of burning peat held over the mouth of the man who works the nets, but will wind and avoid him if but one sniff of his breath be wafted toward them?—London Field.

Sand Dunes of the Atlantic Coast.

WASHINGTON, D. C., Nov. 14,—For several years the sand dunes of the Atlantic coast have been made a subject of study by the Bureau of Plant Industry of the Department of Agriculture, and a number of papers have been issued in regard to sand-binding grasses. During the past summer a study has been made by the Bureau of Forestry to determine what trees and shrubs are most useful in reclaiming the shifting dunes. Considerable damage has been done by dunes, especially in Virginia and North Carolina, and large dunes in several places along the coast are threatening life-saving stations, residences and club houses.

Dunes are formed by the drifting inland of sand washed up on the shore by high tides. The direction of the prevailing wind determines the course of dunes. They advance with the wind, or, if the wind changes its direction, as in New Jersey, they retreat and are blown back into the sea.

Dunes which are advancing on valuable property may be diverted from their course by building on top of them fences placed at an angle to the direction of the prevailing wind. Further drifting of the dunes may be prevented by planting on them beach grass, waxberry, or wax myrtle, which hold the sand together, and the permanent retention of the land can be best accomplished by obtaining as soon as possible a dense stand of forest trees, such as pine and oak.

Black Chipmunk and White.

WATERFORD, Oxford County, Me., Nov. 10.—Mr. Geo. W. Porter shot a few days ago a jet black chipmunk, first one seen or heard of about here. Nash, of Norway, is mounting it. A pure white one was shot in Bridgton recently. A red squirrel partly gray with almost white tail is seen daily at South Waterford.

Only three deer shot so far in town and reported; are seen frequently. Planted ten cans of fine salmon fry yesterday from Auburn. A wildcat (bobcat) was shot at by one of our gunners recently, a rare thing about here. More partridges than for some years, very wild and shy. Woodcock scarce. Some foxes taken in traps, also fat 'coons.

E. PORTER.

Odd Trees.

THE modern sportsman with his camera has one advantage over his prototype with rod and gun—he can secure at least the likeness of inanimate as well as animate objects. There is permanent pleasure in having in one's possession an exact reproduction of an odd specimen; of a tree, shrub, flower, animal or bird. The value is all the greater if the subject of the photograph is comparatively wild, or inaccessible to the ordinary camera fiend. In the "Forest Flora of Japan," Prof. C. S. Sargent reproduces many odd specimens of trees from the mountains and valleys of that odd country. The tree shown is a variety of *Laria dahurica*, a species widely distributed through Siberia, northern China, Manchuria, Kamtschatka and Saghalin. It was photographed by Dr. Mayr on the Kurile Islands.

Notes on Snakes.

CLARKSDALE, Miss., Oct. 24.—I should like to have information of the dentition of cobra-di-capello. I have the impression that his fangs are fixed, and situated at the extreme front ends of the jaw bones, and that he strikes by erecting the head and most of the body, and falling forward. I don't remember where I got that idea.

COAHOMA.

The fangs are fixed and are in front of the permanent teeth.

Coahoma further tells us that Tripod (who captured the two rattlers now under observation) also encountered one at close quarters and killed it. "He had part of it cooked at a country hotel under the guise of 'eel' and brought me a piece to eat. It was scarcely distinguishable in smell and appearance from fried chicken—to the palate more like frog."

A cobra in a church is not conducive to a particularly devotional frame of mind, and the members of the congregation of All Saints' Church, Nagpur, may well inquire of the scaly intruder, *"que le diable faites vous dans cette galere?"* He has taken up his abode in the roof and pokes his ugly head in and out of the rafters during service, and gets specially lively at the pealing of the organ. A local doctor wanted to see what a snake charmer could do, but the custodians of the church would not have the sacred edifice so profaned. The congregation have petitioned the *padre*, but we have not yet heard whether that embarrassed incumbent has succeeded in circumventing this wild sarpint.—Indian Field.

The Outside Dog.

You may sing of your dog, your bottom dog,
  Or of any dog that you please;
I go for the dog, the nice old dog,
  That knowingly takes his ease,
And wagging his tail outside the ring,
  Keeping always his bone in sight,
Cares not a pin in his sound old head
  For either dog in the fight.

Not his is the bone they are fighting for,
  And why should my dog sail in,
With nothing to gain but a certain chance
  To lose his own precious skin?
There may be a few, perhaps, who fail
  To see it quite in this light;
But when the fur flies I had rather be
  The outside dog in the fight.

I know there are dogs, injudicious dogs,
  That think it is quite the thing
To take the part of one of the dogs,
  And go yelping into the ring.
But I care not a pin what all may say
  In regard to the wrong or the right,
My money goes, as well as my song,
  For the dog that keeps out of the fight.

—Philadelphia Call.

Game Bag and Gun.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Imported Pheasants in Tennessee.

KNOXVILLE, Tenn., Nov. 10.—*Editor Forest and Stream:* I am unable to state the progress of this bird in other portions of the State, but in East Tennessee I have been very much interested, and there are but few people even in this section who are familiar with what has been and is being done to encourage this noble game bird in what is a natural home for them, and those who are really interested do not realize that with the proper protection, we should within the next few years have the greatest reserve in the United State if not in the world.

In 1894 the question of introducing English ring-neck pheasants in this territory was discussed by the Knoxville Gun Club, at that time among the most active gun clubs in the country, and as a member of that organization, I purchased from Dr. Verner De Guise, Mahwah, N. J., one hundred eggs, eighty per cent. of which hatched; all the young chicks but three died within a month, however, probably for the reason that we were not familiar with caring for them. Of the three that lived, there were one cock and two hens. This was in the spring; in September these three birds were put out in the foothills of the Smoky Mountains in Severe county, Tenn. The following winter we had a very heavy snow and freeze, which lasted for five weeks, and which largely destroyed the small game in this territory, quail and other small game being frozen out to a minimum. The next spring, however, a full-grown ring-neck cock cock pheasant was seen near the place where these three birds were put out, showing that they had wintered safely; which I think was due to their great strength and heavy feathering.

Being encouraged, I as president of the gun club then purchased from Mr. John A. Durrell, Pleasant Ridge, O., seventeen English ring-neck pheasant. These birds arrived full grown and in fine condition, and were put out in the foothills of the Smokies in Severe county on protected land, the birds being placed in separate valleys that were closely watched, and the first season one nest was found containing forty-two eggs. The hen was sitting, and two weeks later the nest was visited again. Apparently every egg had hatched, there being nothing but shells to show for it. A short time afterward the brood was seen with two old birds, and counted by three parties, one making forty-two, one forty-one and one forty young chicks. Since that time a great many broods have been seen, with from fifteen to forty birds each.

Later on nine more full-grown ring-neck pheasants were secured; one cock and two hens were put out in Blount county and two cocks and four hens in Grainger county. One of the hens in Blount county was killed while on nest by a mowing machine and one by a dog, the old cock soon associated himself with the farmers' chickens, and while he was very shy, at last reports he was still with them. Over in another county, twenty miles from where the first birds were put out, a gentleman found a nest at the corner of his field, and built a temporary fence across the corner, so the hen would not be molested. This hen hatched out twenty-two chicks. I could cite many other similar finds. The birds have scattered over a rather large territory; a great many are now seen in the big mountains where they associate themselves with the native mountain pheasants, of which there are a good many.

In 1896 the gun club succeeded in getting a law passed through the Legislature protecting these birds in the various counties in which they were placed, for a period of five years, with a penalty of $25 for any person caught with one of the birds dead or alive. A boy caught a finely plumed cock in a trap three years ago, and immediately brought the pheasant to Knoxville and offered it for sale, he was told of the offense and an officer accompanied him back home and saw the bird liberated just where he was trapped. The report was circulated around the country and had a good effect; the boy thought it a very rare specimen of mountain pheasant and expected to realize a fancy price.

In the 1900 Legislature this law was renewed until 1905, at which time we expect to have the greatest pheasant reserve in the country, and I think if any person who reads this will stop and figure a little, he will agree with me.

Every one who is familiar with English ring-neck pheasants, will, I think, agree that they are very hardy birds; being large and strong, they are far more capable of protecting themselves than are quail and other similar game birds, and are large breeders. Now just to give you some idea of the probable reserve at the end of the ten years' protection, we will not consider the last nine birds put out, but will assume that each of the ten hens put out in 1895 will hatch a brood of twenty chicks each, which is really a small hatching for these birds. We will allow fifty per cent. for destruction by hawks, foxes and other natural causes. This should give us a balance of 117 birds the first year. Using the same proportion of seven cocks and ten hens, when the law protecting them expires Jan. 1, 1906, we should have no less than twenty-one million ring-neck pheasants, which if placed twenty-five birds in every square yard, would be enough to cover 12,000 acres of land. Now, if any gentleman thinks we are going too high, we will take five birds as an average brood and still have ten and one-half million birds, or enough to load three thousand 30,000-pound freight cars.

These pheasants are in a territory that would largely be under control of the proposed Appalachian National Park in Tennessee. This great movement and its consummation by the National Government will be its greatest gift to the South in its history; and the benefits to all the States lying east and west of the Appalachian range, from Pennsylvania to Florida and from the Mississippi River to the Atlantic Ocean cannot be estimated. We want this Appalachian Park, and we want it bad, and if Congress will authorize this great movement, with the protection afforded by the Government, within ten years East Tennessee and western North Carolina will be the greatest game bird preserve ever known to the world. If you

do not realize what the Appalachian National Park movement really means, then get some literature on the subject, read up on it, then take five minutes' of your time and write your Congressman to favor the bill when it comes before the next House, for it is surely coming before that body of lawmakers.

Along with the many other interesting points of a ring-neck pheasant, there is no handsomer bird; the plumage of a well-preserved cock pheasant is something beautiful. A friend told me that while on a fishing trip on the Little Pigeon River, forty miles above Knoxville, two summers ago, one afternoon while patiently awaiting the maneuvers of a black bass, a slight noise at his back attracted his attention. He had heard some pheasant whistling near by, so he carefully turned his eye toward the noise without moving, and there, within twenty feet, were two hens standing on a mound, and in half a minute a full-plumed cock appeared. He carefully surveyed the surroundings and then began what proved the greatest exhibition of pride my friend had ever seen. He said the cock walked around in the most dominant manner it is possible to conceive, every feather seeming to be placed to the best advantage, with his long tail made into a fan, he swelled his neck to wonderful proportions, all of which the hens seemed to appreciate to the greatest degree of admiration; the exhibition, he said, would make a turkey gobbler or a peacock absolutely ashamed of himself.

I am not as familiar with the habits of ring-neck pheasants as I should like to be, and would be glad to hear more of the great bird from parties who are interested.

Nov. 1 was opening day in Tennessee on quail, and was taken advantage of by a good many local sportsmen. The weather was all that could be desired for a day in the fields with a dog and gun. However, owing to the very rank growth of weeds and briers, and exceedingly dry weather, the bags were small, so far as I have learned. The birds found splendid hiding and it was hard work for the dogs. The season has been the best in years, and birds are plentiful.

For the first time in years I spent the day in the field, and there being no school on Saturday, took my second son, Pete, along, he being very anixous to try his new Marlin repeater. We went twenty miles out on the Southern Railway, where I have the run of two large plantations, which I helped to restock with quail after the big freeze, and upon our return to the station at 3 o'clock in the afternoon, we found we had twenty-six fine birds. The boy made two nice doubles, bagging eight birds in all out of six or seven covies found, the last of which was at the edge of a plowed field. Two got up, which I downed; two got up for Pete, which he knocked down within twenty feet of each other, which made five birds at five shots—time, one-half minute. Who did better?

SAMUEL B. DOW.

The Vanishing Woodcock.

CHARLESTOWN, N. H., Nov. 12.—*Editor Forest and Stream:* Your typesetters made witchwork with my verses, "Over the Long Divide," in FOREST AND STREAM of Oct. 18, by printing "Bland choral symphonies" instead of "Heard," etc. It did not interfere with the rhyme, but it spoilt the reason!

I have been very much interested in the various letters relating to the vanishing woodcock, and agree with your other correspondents that some measures should be taken at once to prevent their entire extinction, and among them I suggest a complete close season at the North until the first of September, and at the South after the first of January. In fact, I do not see why the general Government is not able to pass a law prohibiting the killing of all migratory birds, not the special property or production of any State, such as swans, geese, ducks, woodcock, etc., from the first of March to the first of September. I think it would be fully as constitutional as the Lacey Bill, so called.

I have not shot a woodcock myself for many long years, and only know of their scarcity from general report, but such letters as those of Mr. C. M. Stark are conclusive to me, for he writes from a region which I know well, where these birds were so abundant fifty years ago, that the great dish, at the annual dinner of the manufacturing companies at Manchester, N. H., the first week in October, and to which 100 to 150 guests always assembled, was "broiled woodcock," which mine host Shepherd, of the Manchester House, one of the old-fashioned New England innkeepers, always provided in great style, and for which he always found plenty of birds, as the flight was then in full tide.

I knew the woodcock coverts around Manchester well some forty years ago, and many a pleasant day have I had after the birds in those days, of one of which I was reminded by Charles Cristadoro's letter describing shooting in Connecticut, published a few weeks since. It was a bright Indian summer day, the 1st of November, in 1861, I think. There were three of us, one having with him a staunch old pointer, over which he had shot for years; another a younger pointer he was training for me, and myself. The bag we got was a mixed one, like Mr. Cristadoro's, but a satisfactory one on the whole. It comprised woodcock, ruffed grouse and gray squirrels, and although it is so long since that I forget nearly all the details, I well remember two of my own shots, one, the first one I fired, where I "wiped the eyes" of both of my companions, by a long-range shot at a bird they had both missed, just as he was disappearing round a clump of alders, and the other at a bird going straight away, which my companions both said I had missed, but which I followed up over two stone walls and a road, until I found him, flat on his back in the next pasture, his red breast gleaming in the sun, amid the brown grass.

I think we got a brace of great northern hares that day also. I was shooting that fall with a 14-gauge gun, made by Kirkwood, of Boston, belonging to an old friend of mine, and one of the best guns I ever brought to my shoulder. It had more drop of stock than my own 12-gauge, which was all right to pick a gray squirrel out of a tall tree, but with which I always shot over on the level. I shall never forget that day, the mild air, the bright sunshine, the pleasant companionship and the perfect working of the young dog. We have all laid down the gun now, and one has gone "over the long divide," where the others must soon follow in the natural course of the time.

But this is a diversion from my topic of game protection. I want to see "spring shooting" stopped entirely, and I know no other way than for Congress to assume the authority, and I believe that such a "State's rights" man as Senator Vest would find it constitutional!

Game protection is showing its effects here in this town. Deer are frequently seen, and one herd of three is often noticed on a hill farm, about three miles east of the village. One of my young friends, Mr. F. Way, shot a fine three-year-old buck over in Vermont, where shooting is allowed the last ten days of October, which dressed 145 pounds. It was shot at the base of Skitsewauke Mountain, very near the spot where one was shot last year, and about two miles from this village. I think in a few years more we may be able to allow a short open season in the lower counties of this State, though I do not expect to ever take advantage of it myself. Blaze away at spring shooting in every number, you will bring down the game some day!

VON W.

A Wild Goose on Staten Island.

Shooting in Greater New York.

ON Saturday, Oct. 24, of this year, my brother Will and I started to go blackfishing. The wind was blowing pretty stiffly from the east, our usual storm quarter.

The distance from father's house to the light house where we keep our boat, is about a half mile; I took my gun, thinking we might have some chances at ducks.

When half the distance had been traversed, Will suddenly said, "What is that in Vanderbilt's wheat field, a wild goose?" Looking in the direction toward which he was pointing I saw my first live wild Canada goose on terra firma, and getting opposite where he was feeding on the young wheat, we crouched behind some scrub pines and held a consultation of war. As he was about 150 yards away and nothing better than 1½-inch wheat to conceal one's self, you can imagine what a chance we had of securing him. However, the only chance was to try to "sneak" near enough to secure a shot. So getting flat upon my stomach I began to crawl toward him. Moving only when he bent his head to feed, I slowly made my way toward him. It was hard work, and rough on both me and the wheat. I had made probably fifty yards, and not being used to such work, my head was aching fearfully with every move forward.

The goose now began to observe something suspicious in such a large object upon the hitherto open field, and I was compelled to be more careful than ever.

Soon he began to move away at a right angle, walking faster than I could crawl without being observed, and I looked around to ascertain the cause. In the open field, not 200 yards away, and walking directly toward Mr. goose, came a man. Thinking him a farm hand and realizing that what remained to be done must be done quickly, I jumped to my feet and made for the goose at a dead run. I had not gone six paces when he rose on the wing and started away. Hastily checking myself I gave him both barrels of No. 2 shot, without appearing to disturb him any. Away he flew and making for a marsh about a mile away, pitched.

I turned back and then recognized my father as the man who was walking on the goose. He had come down the road, and when Will showed him the goose, he had walked out in the field, intending to walk around him and walk him back to me. When he reached a certain distance Will was to also start out. Here is where they made their mistake; if Will had gone first, I should have known him instantly and divined his purpose, but supposing father anywhere else but in that field, I did not know him.

We now gathered up our traps and continued to the lighthouse, where Will borrowed "Uncle" Jake's gun and he and I started out for Mr. goose. As Will has killed hundreds of geese in North Dakota, he assumed the leadership, and when we approached the marsh (nearly all covered with cat-tails) he told me to go to the right and he went to the left. Keeping close to the reeds, I made my way carefully along, alert and watchful. I had gone perhaps 75 yards, when a shot rang out, and the No. 4s flew all about me.

Making my way back to Will, I found him at the edge of a "pond hole" and a dead goose in the center. He had shot it through the head while it was swimming in the water, as "Uncle" Jake's gun was only a single barrel and the shot, No. 4, a trifle light.

Getting some stones, we forced the goose to the sedge and carried it triumphantly back to "Uncle" Jake's.

As it was blowing too hard to go fishing, we returned home, and taking my Irish setter (Taffy) I started for a walk and incidentally some game.

As Staten Island hunting is very uncertain, it does not appeal very strongly to Will (who has had such fine shooting out West), so he decided to remain at home.

Heading for a marsh about a half mile distant, I started Taffy looking for English snipe. Like all other Irish setters that I have seen he is very wild for some time after leaving his chain, and he went through the marsh like "hot cakes."

We had covered perhaps 100 yards, when *scaipe, scaipe* went an Englishman, zig-zagging on the left quarter, about 50 yards away, in a frenzy to escape. Right and left barrels rang out in rapid succession, and he came down in a heap, leaving a trail of feathers floating slowly earthward. Taffy retrieved him in splendid form, and we moved forward hoping for more. This was the first English snipe I had shot this fall, and I think it will be my last.

We covered considerable marshy ground after this without a bird, and then passed down to the shore. After walking perhaps three-quarters of a mile I had fallen into a "brown study" and thoughts of birds were far away, when I was startled by the sharp whistle of the yellow-leg, as five of the large ones flushed from a bog, right and left followed each other quickly, and two of the beauties dropped in the water, one only wing broken, the others made a circle and I hastily inserted two more shells into the gun, whistling as I did so. Attracted by the whistle and the wounded bird, they came gracefully around in good range. This time only one came to earth, but I am sorry to say that the other was wounded, and although showing signs of distress, he made good his escape, in company with his fellow.

After Taffy had retrieved the birds, we crossed a meadow and a "flood gate" by the mill pond, and began a tour of the creeks in hopes of a shot at a duck or meadow hen. Shortly after Taffy pointed in the short meadow grass and thinking he had a wren, I called him off. He remained rigid, however, with right forefoot lifted, and I made toward him. Suddenly the bird moved and he sprang for it, whereupon it flushed and was bagged cleanly by my right. A few rods further I flushed a sora rail and added that to my bag, which was assuming respectable proportions.

Now ensued a long ramble around the various creeks, and I was beginning to lose my alertness, when, with a roar of wings a big black duck flared straight toward me. Realizing that my No. 9s were of small moment, I gave him the benefit of the 7½s, and followed it with the 9s; although he continued his flight, he was hard hit, and I watched him getting lower and lower, and finally alight about 600 yards away.

I marked him down carefully, and keeping Taffy to heel, made my way quickly toward him. I thought he had dropped in a clump of blue-bent, but I beat it all over without result. Leaving the grass, I went into an adjoining corn-stubble about 50 yards further and then turned and came back, facing the wind.

Taffy being sent on ahead, ranged back and forth, and finally pointed just at the edge of the blue-bent, but in the stubble. Stepping forward I could not see the duck until he moved and tried to get away; he had covered himself or crawled under some thick soft grass. As he could not fly, Taffy caught him and retrieved him. Then I started homeward fully satisfied with my day's hunt. I reached home at 3 P. M., having been away six hours. As I was going to Connecticut after woodcock the next week, I had my grip full of togs and had to carry my game on a string.

As a wild goose is a rarity on Staten Island, you can imagine the excitement my string created. When I reached the railroad station old Staten Islanders said it was the finest "mess" they had seen in ten years.

In the smoking car, on the boat, up Broadway, across the bridge, and uptown on the Kings County L, it was a continual craning of necks and murmurs of admiration at my game, principally caused by the goose, which was a beauty. It weighed 9 pounds and measured (if I remember aright) six feet from tip to tip.

Thus ended one of those pleasant and eventful trips which remain ever green in memory, to be recalled, ever and anon, with increasing vividness, as youth departs before the irresistible demands of increasing years, and the snowy hair betokens the ripeness of the human fruit.

W. H. EMMONS.

BROOKLYN, N. Y., Nov. 15.

The Coot as a Game Bird.

WITH the gradual decline of duck hunting on Lake Washington, which forms the eastern boundary of Seattle, and extends both north and south of the boundary limits for eight or nine miles either way, there has grown up a system of shooting that is actually funny, irrespective of what one's personal ideas may be about it from an ethical standpoint. I refer to the Sunday battery shooting directed at the awkward and ungainly coot, or, as we call it in the Pacific Northwest, mud hen. Two weeks ago, while coming down from the head of the lake late in the afternoon, I counted three cripples and anywhere from eight to a dozen dead birds. True, it is that Sunday is a day of reckoning for the mud hen. Its slate-black body and ivory-white pointed bill make a good target.

The cannonading commences with the first signs of dawn and lasts, with now and then a lull, all day long. Far down the lake you will see a small launch, and a few moments later the breeze brings to your ears the sounds of guns. Bang—bang—bang, bang, bang, they go. With a wild beating of wings against the water the mud hens are under way. They kick their long, awkward legs out behind, and stretch their black necks forward until at last they get up enough momentum to permit of a fairly rapid and steady flight. Often they will fly at such an angle to the invading battery that a good opportunity is offered for a second volley. It is not so easy as one might imagine to do effective shooting under the latter conditions. The bird offers a good target, and if it does not have the speed of a duck or the corkscrew motion of the snipe, yet the motion of the boat from the waves as well as from the engine injects problems that must be figured out quickly and accurately if good results are to be obtained.

I have seen men who were rated as good shots fail to get "everything in sight," when shooting from a moving launch. Of course, it is an easy matter to get a mud hen just as it gets up, especially if it goes straight away; because the body of the bird sags low, the wings are outstretched and motion is not rapid.

It would seem as though the mud hens of Lake Washington would learn the value of a long flight, but somehow or other they are in the same places every Sunday and seldom take trouble to move until the enemy is within range. I have seen it stated by some authorities that the mud hen is shy of man, but out in the Pacific Northwest the reverse is true; they seem to court danger; perhaps they have enjoyed immunity so long, owing to the "strength" of their flesh, that they believe there is no danger.

I have no idea of the number of small launches that go out with parties, numbering from one to three, for a run after mud hens. One Sunday I counted up to eight and then stopped, and, mind you, I was at only one spot on the lake, while the mud hens are found in every bay along the lake, which easily has a circumference of sixty miles, probably nearer eighty. I asked one party what luck it had and the reply was, "Oh, we picked up a dozen; I guess we got half as many more." At this rate at least 100 mud hens are killed every week, and yet I cannot see that there is any signs of a decrease.

Judging from the effort it requires for a mud hen to fly, one would think that migration could not enter to any great extent into their habits, yet J. Percy Parkinson, formerly editor of the Nome News, who is now in Seattle, says that the mud hen is one of the yearly visitors to the north, and with other water fowl makes its way south in the fall, following the Siberian coast and then the long chain of Aleutian islands. Some of them undoubtedly remain in their Washington marsh homes the year around, but there is no question but that a large majority disap-

pear. I have noticed that Lake Washington is almost destitute of mud hens until about Sept. 1, when they commence to appear, as if by magic.

In times past I have condemned hunters for shooting the mud hen on the ground that it was a harmless thing, even if it were a nuisance. I was surprised to see a statement recently in the New York Sun to the effect that ducks usually gave up feeding grounds to the mud hen. On further investigation, however, I discovered that Leffingwell, who is a most conservative authority on wildfowl shooting, took the position that mud hens kept ducks away from decoys, or, as they say out in the Pacific Northwest, "boosters."

While it is never too late to learn, I must confess that I had never noticed that the mud hen interfered with duck shooting, and I have often seen good-sized flocks of ducks floating about in the water with large gatherings of mud hens. I should be pleased to hear from hunters of this section what their observations have been on this point. C. B. Yandell, who has hunted both in the South, Middle West and Pacific Northwest, said that while he had not given the subject special attention, yet he was surprised to hear that the mud hen was injurious to duck shooting.

More mud hens are eaten now in this part of the country than ever before, which I take to be a certain sign that duck shooting is not the sport it used to be. To those who enjoy this bird I willingly grant my share. I have tried to eat the mud hen, but found the game too strong for me every time. The taste is a combination of mud and fish and it will stay with you indefinitely. The impression left is almost everlasting. However, Captain A. R. Leake, who used to run the Eagle Boat House on Lake Washington, confidently informed me that he would just as soon eat a good fat mud hen as the best red-head that ever ducked eighty times before the weary hunter finally landed him.

"This prejudice against mud hen," said the captain, "is all bosh. Why I can cook a mud hen so you couldn't tell it from the finest duck that ever flopped a wing, or wiped the eyes of a hunter."

I asked the captain how he cooked the bird, and he said that he cooked it until all the strong flavor was cooked out of it. These directions were rather indefinite, but I passed them over to my hunting companion, L. F. Murdock, who can cook anything in the catalogue from a dish of mush to a Delmonico dinner. He was very skeptical, but said he would make one last effort to see if there was anything in the captain's contention. He kept that lone mud hen in water over night, he parboiled that poor fowl, he cooked it in water dosed with soda, he stuffed it with garlic and everything else known to the culinary art in hope of beating that fish and mud taste, but when the dinner came I capitulated—mud hen is too strong for me. But it furnishes great sport for the boys on Lake Washington.

PORTUS BAXTER.

Deer and Humans.

Editor Forest and Stream:

The story is told, I think, of Coal Oil Johnny or some other lightning high roller spendthrift, when, after having gotten through with buying hotels and giving them away and chartering special trains and yachts and other things, on once more donning his overalls and with pick and shovel working in the ditch, a lawyer came along and notified him that an uncle in Ireland had just died and left him a million. With a look of despair on his face Coal Oil Johnny exclaimed: "My God! Must I go through all this thing again?"

And so with the deer-shooting season, it's on again and it's up to the reader of the morning paper to once more go through the daily accidental killings. And despite all the warnings and preachings, the same crowd, with numerous additions, are trapsing into the woods armed with their small caliber rifles and their pockets filled with steel jacketed smokeless ammunition. There is about as much sense in taking such rifles and ammunition into the thickly grown woods of Minnesota and Wisconsin as there would be in using a Gatling gun wherewith to hunt cottontails in the brush.

Certainly deer hunting has its joys and pleasures, for during these beautiful autumn days perhaps no places are more inviting than the forests and the clearings, yet one takes one's life in hand when entering the forests during the open season for moose and deer. And curious to relate, the aim of the "thought-it-was" hunter is so absolutely deadly on human beings, horses and cattle, while when shooting at the real thing the emptied magazine and a circle of spent shells is the only thing to show.

It may be an inconsequential thing to accidentally shoot a fellow hunter in the woods, nothing further coming from it than appearing before a coroner's jury and being exonerated, but not so as to killing stock. Two Nimrods saw something brown through the brush and blazed away in their excitement, pumping their magazines empty and sending every bullet home. Hastening toward their prostrate game, they found stretched out upon the ground a heavy draft horse, such as is used in lumber camps, breathing his last, his side showing where every ball had entered. And attracted by the fusilade the camp boss appeared on the scene and demanded a quick settlement then and there. Between the two hunters $100 in ready cash was raised and handed over, and the trio marched to camp and then and there notes—demand—were signed for $150 more, and the hunters went back home to think it over and raise the stuff.

Who ever heard of a hunter being fined for killing another hunter accidentally in the woods? And the moral stands that it is cheaper to kill a human being in the woods than the stock of the farmer or camp owner.

A report comes in of a mother, with a babe, standing in the doorway of her cabin in the clearing, hearing something whiz past her face and feeling the child shiver, she looks down to see the child lifeless in her arms. Simply a case of a steel jacketed bullet "fetching up somewhere."

A traveling man reported to me an incident of eight men going into the woods deer hunting, and when they returned the party brought home three dead comrades and two deer. This was vouched for as a fact.

But then what's the use of preaching, like Coal Oil Johnny, we take up our morning paper and go all through it again.

CHARLES CRISTADORO.

The Elk I Did Not Get.

WE had talked of little but bull elk for three months. We had studied every available map of the Northwest. We had finally agreed as to the place, and our dreams were soon to be realized.

We arrived at Athens, Mont., about midnight, Oct. 20, 1901. Our luggage was hastily hurried from the car, and with a hearty "good luck" from the train crew they were off, the colored lights disappearing around a curve into the darkness, and we were alone. A hasty examination of our surroundings disclosed the fact that Athens consisted of a board with that name painted thereon, nailed upon a post, and a deserted pump house. We soon had our luggage together beside the latter, built a fire, and after a lunch of coffee, canned beans and hardtack, rolled ourselves in our blankets to be lulled to sleep by the autumn wind whispering through the pines.

Next morning our guide, with whom we had made previous arrangements, appeared bright and early, and by 4 o'clock that afternoon had reached our destination on the shores of beautiful Lake Ashley, and felt that we had made no mistake in the selection of our hunting grounds. After a supper of mountain trout, flapjacks and coffee, we lit our pipes and sat around the camp-fire, our guide entertaining us with stories of his early days in Montana. He related how he had seen deer come and browse from the branches of the identical tree from which he had been chopping wood; how he had shot and killed an immense silver-tip, the largest known to have been killed in Flathead Valley; how he had been attacked by a mountain lion, which drove him to a small cave in the rocks, where it held him a prisoner all that night and greater part of the next day, he defending himself with a club, with which he finally, driven desperate by hunger and thirst, dispatched the beast. He told us of a band of Indians that had run down a large herd of elk, aided by the deep snow, and had killed them all, some thirty in number, on the identical place where we were now camped. Full of these stories of the chase, we rolled ourselves in our blankets and long after my companions were asleep, I lay there, listening to the many sounds that came from the forest. A soliatry bobcat screeched from his stronghold in the cliffs over the lake, and I thought it the most dismal sound I had ever heard. Now my attention was attracted by the little stream, the outlet of the lake, babbling over its rocky bottom, and my mind went back to school days at the thought of the little poem:

"Men may come, and men may go,
But I go on forever."

But listen! What is this sound I hear? Is it the sound of some great animal trampling in the mucky banks, or is it the wind. The sound grows louder and more distinct. Yes, surely this must be some animal, perchance an elk, cooling his burning hoofs in the cool stream after many a mile of travel through the uplands in quest of food. I grasped my rifle and crept forth.

The great hunter's moon had just arose above the horizon, and there before me, his great massive antlers dimly outlined in the moonlight, stood the one object of which I had thought, talked, yes, even dreamed about: a beautiful bull elk. How my eyes feasted on his beautiful form. I could see him more distinctly now; could even count the points on the coveted antlers that would soon be mine, one, two, three, four, five, six, seven—seven points. I had honed for eight, but would surely be content with these. I raised my rifle and taking steady aim at the massive shoulder, fired——.

"Goll ding it all, ain't you fellers ever going to git up?" shouted our guide. "Breakfast ready and waiting."

I sat up and looked about me in amazement. There was the guide bustling about camp getting breakfast, my partner just emerging from his pile of blankets, but my elk had disappeared into the depths of dreamland.

CHICAGO AND THE WEST.

Good Duck Shooting.

CHICAGO, Ill., Nov. 14.—The good duck shooting which began ten days ago has continued with us throughout the week up to this time, so that on the whole we may call the fall duck shooting here above the average in excellence. In the past week some very good bags have been made at all of the remaining open waters of this State, and nearly all of the better ducking clubs have been adding good scores to their game records.

Day before yesterday was well nigh a record breaker in the way of an exodus of duck shooters. Reports came down from Fox Lake the day previous to the effect that a heavy flight of birds was in on that country, and on the day mentioned it is stated that more than 30 shooters left Chicago for that district. One can nearly always count upon plenty of company if he goes to Fox Lake. Grass Lake, or any of the marshes in that vicinity, but the man who was up there yesterday would probably have been lucky if he came back without having his skin full of shot. Some stories of good bags come from Fox Lake, but when these are sifted down it is found that the mud hen makes a large factor. Yet they undoubtedly had a big flight of mallards in over that country for the past week, and a few of these have been killed.

Mr. W. L. Wells, mentioned last week as starting for a ducking trip, had only one day's shooting, but got 14 fine mallards. His companion, Mr. Robert Stites, has not yet returned, but was having good sport at last accounts.

Mr. Eddie Pope came in from New Boston with the report that the warm weather had continued in that vicinity and that no great number of birds had been seen near the river in the Mississippi valley. He says that the mallards are in but that they stick to the cornfields and will not take to the overflows in the timber land until rough weather or a snowstorm drives them in for shelter.

Mr. I. V. Clarke, elected last week a member of the Tolleston Club, left this week for these happy hunting grounds. Mr. C. S. Dennis went with him. Mr. Dennis one day this week ran down to the club, which is only about 28 miles from the center of Chicago. He go there about noon, had lunch and by 3:30 had knocked down 18 fat mallards.

Mr. Geo. Adams, also of the Tolleston Club, reported that he got his limit of 24 birds before 11:30 o'clock of the morning he was down.

Mr. Geo. Marshall, formerly a prominent member of the Calumet Heights Club, was down at Water Valley, Ind., one day this week and killed 19 mallards before 3:30 o'clock.

All along the Kankakee marshes the sport has been very good, the best, perhaps, which has been known for many years. The weather has been just severe enough, cold storms alternating with warm days, so that the flight is in on this country, but not yet driven toward the south. At this writing the temperature is rapidly dropping and we may expect the coldest weather which we have had yet this fall, all of which may tend to give us even better duck shooting than we have had for a few days, barring an absolute freeze up.

Mayor Harrison, of Chicago, left early in the week for Swan Lake Club, and is supposed to be meeting good sport, although no word has come up from him since his departure.

Mr. Hempstead Washburne leaves this afternoon for a trip to Tolleston Club.

The Quail Crop.

Nothing very startling comes in regarding the extent of the quail crop. There are some birds, but there is no such startling aggregate as was the case two years ago this fall. Several shooters have gone down to that once famous point, Neoga, on the Illinois Central in this State. There is a dog trainer there by the name of Kunz who works dogs for some of the Chicago shooters, hence this point is very well known. Mr. C. H. Bonnell, of this city, returned from this point a few days ago and reported that while they found some birds, the crop was nothing startling. Mr. J. L. Jones, of this city, who was shooting in the same vicinity, had not been heard of at last accounts. Mr. Harry Raymond and his friend, Mr. Blair, also went in at Neoga this week and are thought to be sharing on about the same basis in the quail shooting of that vicinity.

Mr. E. Ellicott, city electrician of Chicago, left this afternoon for Custer, this State, where he meets Bill Haskell, also a member of the Wishininne Club. Mr. Haskell says that there are ducks and quail in abundance at Custer. Mr. Ellicott takes with him his two setters, which I saw this afternoon and which I must say are two of the handsomest bird dogs I have seen in a long while. He should have good sport in view of the nature of his rolling stock.

The Deer Season.

The deer season is now in full swing in our north woods, and it is to be supposed that the usual number of deer are being killed. The shortness of the season and the growing observation of the game laws still assure us some deer in Wisconsin and Michigan.

The usual number of fatalities are beginning to be announced from the deer hunting country, the names of the victims of shooting accidents being, in most cases, suppressed. Another proof of the haste and carelessness of a certain class of deer shooters is to be found in reports of several horses which have been killed by fools with guns. In Ontanogan County, Mich., a lumberman by the name of Duquette lost a horse said to be worth $250. He made the men who shot the horse settle up with him in full before they left the neighborhood.

At Otsego, Mich., Henry Shoulders was riding through the woods on a white horse. A shooter by the name of A. S. Myers saw the horse going through the woods and fired at it, as he says, on the suposition that it was a wolf. It is difficult to understand why a peaceable white horse should look like a wolf, but, at any rate, Myers shot the horse in the head, happily missing the rider. The horse is not yet dead. Mr. Myers paid Mr. Shoulders $100 for his mistake.

Still another story of a similar nature is told regarding a Republic, Mich., man, who also had his horse killed under him. It is getting to be nearly as dangerous to go deer hunting, or even not to go deer hunting, up in this country as it is to go into a pitched battle. When a hunter can come back and tell how many horses he had killed under him, he is, in a fashion, getting into the class of George Washington, General Grant, etc. There seems to be no practical remedy for this criminal carelessness with firearms.

Too Much Venison.

A Davenport, Ia., man by the name of Davis undertook to go home from Wisconsin by way of St. Paul. He had four saddles of venison with him, the law allowing but two. He was arrested and taken from the train at St. Paul by the able wardens of that city, but making a strong talk to Warden Boyd about his prominence, his certainty to return, etc., he was allowed to go on his way to Iowa, leaving his venison behind him. There was a considerable stir over the matter at the time, but owing to the fact that he is now out of the jurisdiction of Warden Boyd, the matter seems to be at an end at this writing. The Davis incident may give warning to other shooters who propose breaking the Minnesota game laws because they don't happen to suit their convenience. St. Paul is getting to be a dangerous place for law breakers, and has been all through the fall. To be hauled off of a train en route home, to have one's game confiscated and to linger for a few days in the custody of the Minnesota law officers is no very pleasant thing to contemplate. The best and simplest way is not to break the law.

Millionaires and Ducks.

Speaking of St. Paul, another little case comes to mind showing that one cannot with impunity always break State laws, even though rich. There are a couple of shooters by the name of Thompson who go out into North Dakota from St. Paul, wealthy men and apparently caring for little but shooting. I always thought that a man who was placed where he didn't have to work ought to work a little bit, anyhow; but that's neither here nor there, and this particular phase of the Messrs. Thompsons' sphere in life does not concern us. The important thing is that they kept on shipping ducks out of North Dakota into St. Paul, obviously with the understanding of some one at the

shooting end of the line. Warden Fullerton, learning of the arrival of one big bunch of ducks from North Dakota, instructed his deputy warden to seize them, and he did so, 176 ducks being seized, which had been shipped in trunks and in a carry-all bag. It had been the custom of the Messrs. Thompson to send their ducks to cold storage in St. Paul, and hardly had the warden confiscated these birds before the wagon of the cold storage firm called for them. The warden refused to give them up. A short time after this an attorney by the name of Griggs called upon Warden Fullerton and stated that these ducks had been seized without due process of law and asked Fullerton if he would give them up. Mr. Fullerton's answer was short and direct. He said "No."

"If I get a statement from your district attorney here in St. Paul stating that the Lacey Law is no good in this case, will you give them up then?"

"No," was the answer.

"If I get a statement from the attorney-general of the State of Minnesota to the effect that the clause of the Lacey Law is invalid, will you give up the ducks?"

"No," said Mr. Fullerton.

To several other hypothetical questions he returned the same answer, and Mr. Griggs, a far less pompous lawyer than when he came in, left the office, having failed to make Mr. Fullerton turn over the ducks to the Thompsons by means of a straight bluff.

Mr. Griggs then went to the governor of the State, seeking to bring the highly commendable agency of political pull into play. The governor was not accessible, but his right-hand man stated that he always thought Mr. Fullerton an able officer, and he declined to interfere.

Mr. Griggs then called upon a certain U. S. Senator, and the Senator called Mr. Fullerton up. "Sam," said he to Mr. Fullerton, "you know I don't want to interfere, but I just thought I would ask you in my personal capacity if you would give up these ducks." Mr. Fullerton said no, and the U. S. Senator replied that it was all right.

Upon this Mr. Griggs brought suit against the State Fish and Game Commission, and the case will come up for trial later on. It is in many ways an interesting one. Mr. Fullerton wrote to the authorities in North Dakota and asked their co-operation in the prosecution of the suit. He received no reply. He wrote yet again to the attorney-general of the State, and at this writing has had no answer. While it is not within the bounds of courtesy or of knowledge to accuse the State warden of North Dakota of any criminal knowledge of this violation of the North Dakota law, the fact remains that North Dakota had not at the date of two days ago, taken any steps to aid in the fighting of the suit. Mr. Fullerton got little assistance from Mr. Palmer, at Washington, who has most to do with the enforcement of the Lacey Law. The case of the Thompsons will be fought upon a technicality which may show a weakness in the Lacey Law which ought soon to be remedied. It is claimed that the birds were killed legally in the State of North Dakota, and that the Lacey Law acts only in the case of birds killed illegally. The question of illegal shipment, according to Thompson's lawyers, cuts no figure if the birds were killed legally. It is admitted that the birds were not properly tagged, as the Lacey Law stipulates, but it is held by the plaintiffs in this case that this does not operate, since the birds were killed legally. The intent of the law and the construction of the law will all come up in this trial. Even if Mr. Fullerton shall eventually be defeated on this technicality, too much praise cannot be given him for the courage with which he resisted all this pressure brought to bear upon him and stood out for the upholding of the game laws even when he was not sure that he had absolute footing beneath him. This case will, therefore, be an interesting one. If it shall bring into public contempt the wealthy men who openly and deliberately break the game laws of this and a sister State, it will have a good effect, no matter what the result of this suit may be.

Cobb Caught.

One Mr. Cobb, a cold storage man in St. Paul, has at different times figured in game law incidents in the city of St. Paul. We may remember that last summer a little convention of game wardens was held out at the Yellowstone Park. Here is one of the results of it. The State game warden of Oregon had a decoy letter sent in to Mr. Cobb, of St. Paul, requesting that the latter ship him out a couple of dozen ducks forthwith. The ducks were sent through all right from St. Paul, all the way out to the Pacific coast. There was not much profit in two dozen ducks, and there will be still less by the time the Minnesota wardens get through with Mr. Cobb, who thus so easily put his head into what might have been called a pretty obvious sort of a trap.

Some of the above little incidents I learned from Mr. S. F. Fullerton himself in the course of a call made at this office during the week. Mr. Fullerton was in town on private business.

By the way, in regard to the charges made by a local sporting paper here against the honesty of Mr. Fullerton and his associate wardens, I think I violate no confidence in pointing out that, in view of the personal records of the executive officers of the Minnesota State Fish and Game Commission, there will be no retrocession from Mr. Fullerton's earlier statement that the American Field would either have to retract its charges of dishonesty or have a chance to prove them in court. As honest and fearless a man as Sam Fullerton would hardly be apt to rest under malicious vilification, such as that in question. The only wonder is that any paper claiming to appeal to the sportsmen of the country could ever find it within possibility to make such absurd and unfounded charges. Much of this will no doubt come out in legal developments, which will ensue in proper course.

Sportsman Receives Honor.

George Shiras, III., the well-known naturalist-photographer, whose beautiful flash-light pictures of deer have become classics, was in the late election chosen as representative in Congress for the Twenty-ninth District of the State of Pennsylvania. The Pittsburg Times prints comment upon this election in the following terms:

"The introduction of Mr. Shiras into the National hall of legislation will bring to the statesmen of the country a modest, unique and interesting figure. Mr. Shiras is six feet four inches tall. He is equipped for statecraft in every possible way, but by inclination. Naturally he turns to the rugged in life. The woods and water ways, wild animals and big game delight him more than do the confusing problems of law or legislation. Yet withal he has an artist's nature. He has rare capacity as a lawyer, and he is experienced in legislation. On account of the peculiar tastes and disposition with which Mr. Shiras is endowed, he has often been likened to President Theodore Roosevelt, and when he finally reaches Congress it it practically certain that the President will not have a more ardent supporter or advocate than the new Allegheny representative. He comes of a family of lawyers. His father, George Shiras, Jr., is now serving as a justice of the United States Supreme Court, while his uncle, Oliver P. Shiras, is United States district judge for Iowa.

From boyhood Mr. Shiras has been an ardent hunter, and big game has been the attraction. When he was but 12 years old he shot his first deer on a small lake in northern Michigan about eight miles distant from Lake Superior. He now owns that particular lake and about 3,000 acres of forest surrounding it. Within the week, likely, Mr. Shiras will go to his preserve, where he will entertain a party made up of members of his own family. Don M. Dickinson, ex-Postmaster-General of the United States; Harry Russell, president of the Michigan Central Railroad; W. H. Drummond, the poet laureate of Canada and a distinguished sportsman and writer, and others of the same class.

The flashlight photographs of wild animals taken by Mr. Shiras have commanded the admiration of civilization. He was the pioneer in that skillful work. While a fairly large class followed Mr. Shiras into that artistic school his work is said to lead them all and is alone in its kind. Mr. Shiras contends that the sight of a wild animal within photographing distance shows the necessary hunting skill and is just as thrilling to the hunter as is the killing of the animal and his school of sportsmen no longer raid the woods with their guns.

Meat in the Family.

My friend Powel writes me as below: "I went out the other afternoon at 3 P. M. from a place in the country where I was stopping, and took Dolly along. Found a bunch of quail in the cover, had four points, four shots, four quail. Then I saw a little bunch of mallards on a pond, and Dolly and I made the sneak of our lives to them. Got three nice fat mallards. Then some of the boys from town came down, and after supper we took the hounds and got three 'possums. We surely are going to have meat at our house for the next few days." Mr. Powel adds that the weather is still warm in his part of the world, but the prospect is for cooler days before long.

Saginaw Luck.

The Saginaw Crowd was out four days at the beginning of the Michigan shooting season, and had plenty of success, half a dozen guns averaging six or eight partridges and several quail to the day, the trip being one of the most successful the car party ever took, in spite of wet weather.

Long-Bowed Snowshoes.

Mr. W. W. Brown, of Springfield, Vt., writes: "I have just completed your 'Trip Across New Brunswick on Snowshoes.' There is just one thing I don't like about your tales. They are too quick. Otherwise they are all right. I have tried through stores here in the East to get two pair of the long turned-up snow shoes used in the Klondike country, and which you spoke of in the above story in the FOREST AND STREAM. Will you aid me in getting them? I saw some once in a sportsmen's show."

This is a funny world. Only the other day I got a postal card signed Many Readers, and dated at Worcester, Mass., chronicling an opinion directly the reverse of Mr. Brown's, and intimating that my story was "hot air" and ought to be discontinued at once. I thank Mr. Brown and Many Readers. As to the snowshoe, if Mr. Brown will write to Metz & Schloerb, Oshkosh, Wis., he can, I think, get a pair of these long-bowed snowshoes known as their "Alaska model." These shoes are, however, not filled in Alaska, but in Montreal. The round-toed Alaska snowshoe, made a little fuller in front than the model earlier mentioned, but filled in front of the toe bar in such way that the filling curves up and does not stretch flat across the bow, can be had in a shoe made in Montreal. I do not know the name of the Montreal firm making these shoes, though I believe they are strung by the St. Regis Indians. Perhaps M. F. Kennedy & Bros., of St. Paul, Minn., could give advice in this matter.

These shoes above mentioned would be as good as any trade shoes and far better than the average snowshoe made in the so-called Montreal pattern. Of course, if one could get the long bows and have them strung specially with caribou filling, and done by a man rather than by a woman, he would get a better and more durable shoe. I do not know whether Arthur Pringle, of Stanley, N. B., would fill one of these long bows or not, as he would naturally have a leaning toward the New Brunswick shoe with which he is so familiar. The filling in this New Brunswick shoe is too close for travel in the Rocky Mountains, where the snow is so moist and heavy. My own idea of a shoe for comfortable travel would be one of these Alaska models which would come about to the chin when one stands up by the shoes: these filled with meshes of not less than a half-inch in the body of the shoe, not quite so coarse in the toe filling, but made with a curved or convex toe, as is done by the Alaska Indians in their light and long "tripping" snowshoes. In these shoes the toe hole is long and ample. They are not comfortable for getting over logs and climbing through cedar windfalls, as the New Brunswick hunters and trappers are obliged to do very largely in their snowshoe work: but for straightaway travel on a fairly open trail, I personally prefer these long-bowed shoes to the shorter and wider "codfish" patterns.

Trapping Luck.

Mr. George T. Farmer, of this city, shook off the cares of business for ten days this month and went trapping up near Long Lake, in Wisconsin. Mr. Farmer used to be an employee of the Hudson Bay Co., so he knew something about setting traps. In ten days he caught seventy-six muskrats, seven good black mink, one raccoon and one skunk. Mr. Farmer tells me that he sets his skunk traps on a spring pole, so that when the animal springs the steel trap it is thrown into the water and drowned. This renders it odorless. Mr. Farmer also established connections for a few brief moments with an otter. He found a couple of the toes of this otter in one of his muskrat traps. The otter had cut down the brush to the full length of the chain and the little trap had apparently held him for quite a while.

Called.

Mr. Miles Taylor, an old-time Kansas shooting companion of mine, whom I have not seen for twenty years, called at my office one day this week, and I was unfortunate not to meet him. Mr. Taylor has for many years been the private secretary of Senator Marble, of Montana, and his residence has beeen for the greater portion of the time at Washington. W used to shoot ducks and geese together on the Arkansas River, and I would like to see him to talk over old times.

Decoyed In.

The largest black bass ever taken in Lake Minnetonka, Minn., and one of the largest recorded in the North, was captured a week or so ago by a young man by the name of Fuller. It weighed eight and one-half pounds, and at the same time he caught another one which weighed over six pounds. The big bass was taken in to the office of the State Fish and Game Commission, and is being mounted. This fish was caught not far from Spring Park, in the upper lake, and directly in front of the long cottage known as Camp Messasebe, on that water. The cottage was shut up, but there were a lot of old numbers of the FOREST AND STREAM lying around in it, and I have no doubt at all that the fish decoyed in to some of the fishing stories contained in the FOREST AND STREAM.

E. HOUGH.

HARTFORD BUILDING, Chicago.

New Brunswick Visiting Sportsmen.

THE Miramichi Advance, published at Chatham, N. B., makes this comment upon one of its contemporaries which has been indulging in unwarranted criticism of the non-resident law:

The Chatham World appears to have no regard whatever for facts when it undertakes to attack any individual or class of men. Its quarry last Saturday was the hunters who come here for big game. It represented that each hunter from the United States paid a license fee of only $20 and killed three moose—"one for himself, one for his guide and another for his servant." Everybody knows that this is a calumny as mean and cowardly as some other slanders for which that paper has been brought to book, for the sportsmen coming here from abroad—from the United States, as well as from Great Britain—are, as a class, very honorable men and particularly careful in their observances of the law.

The World further says that in some of the States the license for moose hunting is $100, and that a good many New Brunswickers are of opinion that foreigners should be required to pay as much as this for the privilege of hunting big game in this province.

There is a lot more of such stuff in the World's article, which shows that it is ignorant of the game laws of all North America and the conditions attending big game hunting, as well as entirely reckles and unreliable in making statements on the subject.

The non-resident hunting license fee in New Brunswick is $30—not $20.

There is no State in the American Union in which even one-half of $100 is charged for a moose hunting license. In many states no license fee at all is required. The lowest is in Maine, $5 for owners of hunting camps (guides) the highest in Wyoming, $40. With the single exception of the last named State, none of them charge as high a fee as New Brunswick does.

It is the pride of New Brunswickers interested in the subject that their province has the reputation all over North America of having the best code of game laws extant, and its officers command universal respect for the efficiency with which they are enforced. The world ought, therefore, to apologize for its untruthful and slanderous statements.

Long Island Game.

LONG ISLAND CITY, N. Y., Nov. 13.—Advices from Brookhaven report that a party going out there shot 31 quail in one day. Plenty of ducks, both black and broadbill, are to be had at Brookhaven, and arrangements can be made with Shepperd Newey, of that place.

The Bohemia Club, located at Sayville, shot 25 deer the first day of the season. Ducks are plentiful in Great South Bay.

Deer shooting at Ronkonkoma has been remarkable this season—thirty deer having been killed, those having been shot weighing between 100 and 200 pounds. A remarkable buck taken from this station was shot by J. D. Crosby, of Lawrence, L. I., and a party of friends. It weighed 250 pounds, with antlers beautifully formed, each antler having three prongs and about a foot and a half long. It was about four years old and the most beautiful specimen seen here this season.

DEER are very few in number in Connecticut, though at long intervals it is announced that one has been seen. Not infrequently their tracks are found in the central part of the State in the town of Killingly, and a year or two since two were said to have been seen by residents on Stratford Point. Last week, Nov. 14, an antlered buck was found grazing in a rye field on Beaver Brook Farm, in the town of Milford, Connecticut, not very far from the Housatonic River. Just where he came from is uncertain. It will be remembered, however, that two or three years ago a resident of a small New York town on the Hudson River, not far from Sing Sing, lost a number of deer from her park by the breaking down of the fence. These deer, from all accounts, were never recovered, and it is very likely that they scattered themselves over western Connecticut.

Cuvier Club's Banquet.

THE twenty-ninth annual banquet of the Cuvier Club of Cincinnati will be held on Tuesday evening of next week, Nov. 25.

The Adirondack Deer.

THE deer hunting season in New York State, which opened on Sept. 1 and closed Saturday, Nov. 15, was, on the whole, a good one. The deer have been numerous and in fine condition, and hunters have been successful in obtaining a great many of them. There were probably more hunters who enjoyed the sport this year than ever before, and it was a fairly good season as to the conditions for hunting, although not an ideal one. During the early part of the hunting season and up to about Sept. 10, there were very many more deer killed in the Adirondacks than there ordinarily have been in the same period in preceding years. One reason for this was that the weather was favorable for the deer continuing to come down to the lakes, ponds and streams, as they are in the habit of doing in the summer months and the consequence was that many were killed by hunters who laid in ambush along the shores awaiting their appearance, or by others who in violation of the law hunted them after dark with the aid of artificial lights. The hunting accidents which occurred early in the season undoubtedly saved the lives of many deer, for the reason that hundreds and probably thousands of hunters who, but for the fatalities and casualties, would have visited the wilderness in September and October, were prevented from doing so by the thought that they might share the same fate that others had at the hands of careless marksmen.

So far as the conditions for hunting were concerned from Sept. 10 to Nov. 1, they were better on the whole than they were in the same period last year, for in spite of the fact that the woods were dry and noisy at times, there were more frequent rains this year and the conditions for still-hunting were more often favorable. Nevertheless, there was comparatively little hunting done during this time, for even the guides and woodsmen became very cautious about prowling through the undergrowth while the leaves were on and taking the chances of being mistaken for a deer. The result was that for several weeks after Sept. 10, there was a very marked decrease in the number of deer killed. About Nov. 1, however, hunters began to flock to the wilderness in great numbers, and within a week there were more men in the Adirondacks in pursuit of deer than had ever been there before at one time. The leaves had all fallen from the deciduous trees and shrubbery by now, and hunters were not only able to see a deer further in the woods, but they believed that there was less risk of being shot at through mistake. During the first days of November, however, it was very dry in the woods, and it was almost impossible for a hunter to get around without making a great noise in the leaves, and thus giving the deer an early warning of his approach. Still-hunting was out of the question, and whenever a deer was killed it was ordinarily the result of good luck rather than skill, but in spite of this state of affairs, there were a good many deer shot. But rain finally came and the last ten days of the season were as favorable for still-hunting as they possibly could be without snow on the ground. The wilderness was overrun with hunters and the crack of the rifle and boom of the shotgun resounded among the mountains and through the valleys from morning till night.

It is safe to assume that not more than one shot out of ten brought down a deer, and not more than one hunter in ten who visited the big woods killed his own venison, but notwithstanding these facts, there was a great slaughter. Although definite statistics are not yet obtainable, it is believed that the aggregate number of deer killed in the Adirondack region this fall was fully as large as last year.

It is an interesting fact that deer hunters are coming to exercise greater caution than ever before in regard to their shooting, most of them having established the rule never to fire at an object without knowing absolutely what they are shooting at. Quite a number of hunters and guides in different portions of the Adirondacks have set the fashion of wearing bright red hats, sweaters, shirts and occasionally full suits of red, in order to minimize the danger of their being mistaken for deer or bears. People who have made a study of the subject say that the wearing of red does not in the least diminish the probabilities of a hunter seeing game in the woods, but on the contrary it may assist him for nearly all animals, deer especially, are greatly interested in the color and pause to gaze at it with the same curiosity that they watch a light at night. Certainly it seems a very wise precaution, and it is believed that if all hunters would adopt it the result would be to materially lessen the number of shooting casualties.

According to reports which came in late in the season, there have been a good many violations of the game laws in the Adirondacks this fall, including several instances where dogs have been used in hunting deer. In a number of cases the hunters who have thus broken the law have muzzled their dogs so that they were prevented from giving voice while following a deer, the idea being to reduce the chances of detection. It is a shrewd dodge, but one which the game officials will probably not be slow in getting on to. The dogging of deer was carried on very openly last fall, but somewhat more caution seems to have been used this year. It is a practice which should certainly be stopped if the law is to be allowed to remain in force, for it is unjust to law-abiding hunters to permit such violations. It is extremely aggravating to a party of hunters who obey the law and fail to get a deer, to know that another party, whom there is good reason to suspect violated the law, although there may be no positive evidence of it, have killed their full quota of deer. Reports have also been received regarding the use of artificial lights in deer hunting, and of salt licks placed in the woods to entice the deer to some locality where it would fall an easy prey to the ambushed hunter. If the present force of State game protectors is not sufficient to insure the proper enforcement of the laws, then it should be augmented until it is equal to the emergency.

Although deer hunting has been permitted in Sullivan county during the past fifteen days for the first time in five years, and deer have been very abundant there, some of the hunters who reside in that county have beeen in the Adirondacks of late, giving as their reason for going such a distance from home that there were so many shooters from New York and elsewhere flocking into their towns that they did not care to risk going into the woods there. If the hunters have been any busier in Sullivan county during the past fortnight than they have in the Adirondacks, they must have stirred things up pretty thoroughly. W. E. WOLCOTT.

UTICA, N. Y., Nov. 19.

The Maryland Season.

STOCKTON, Worcester County, Md., Nov. 8.—The summer has passed, and the long, lovely days of fall are with us—days when it is perfect happiness just to be alive.

At one time it looked as if the summer would go by with no beach birds to our score; all July we waited with not a bird; the summer was cool and dry, with no water in the ponds, and no place for the birds to feed. Then August nearly passed, when at last there came a run of overflow tide, followed by heavy rains, and the yellowlegs and dowitchers swarmed in like the famous locusts of Egypt. It made grand sport; day after day we piled them up, two and three hundred of a morning, until the flight was gone. These flights lasted far into October, sometimes resting only for a day, then again two or three days would be their stay; but after the first flight, which lasted two weeks, none were with us in numbers more than three days at a time.

So far the fall has been very warm and pleasant, with few ducks on the shoals, except coots and shell ducks, which no one bothers. A heavy northeast dry storm has been blowing for several days, with a shifting to the north, and bluebills and redheads are coming in fast, the dark line of feeding beds are showing up nicely on the open shoals. This time last year the shooting was fine, but through the whole season everything, even our quail, appear to be from two to three weeks late. I am using both a double and a single battery this year; all my old patrons are much pleased with this, as two shooting together make it far more companionable, with no long waits for turns. Where but two are in the party they shoot from morning until night, every day they are here. In the single box one man can shoot all day, or two can take turns. We have plenty of grass feed on the shoals, and there is no reason why the fowl should not be with us in numbers exceeding last year's flight, which was the finest I ever saw here.

Like all other localities I can hear from, we have more quail here than ever before, but with many coveys of very small birds. O. D. FOULKS.

Test of Maine Game Laws.

A PECULIAR phase of the Maine game law is emphasized by the case of Lloyd Foss, of Bingham, who is wanted by the Maine game wardens on the charge of killing a bull moose out of season. Foss is to be brought into court and is due to receive a fine of from $500 to $1,000 or spend four months in jail. Foss makes no secret of killing the moose, but the case shows that the law affords protection to a fierce and rabid animal, but no protection to the taxpayer and resident of the State who, in self-defense, may kill a human being, but not an animal. The Maine moose have been uglier than ever this year, and several inoffensive loggers who were unarmed have been treed by moose. Hunters have also met the same fate and have not dared to shoot, for the law has forbidden the shooting of moose out of season and the authorities have refused to accept a plea of self-defense. A big ugly bull moose has been ranging over Somerset county and considerable trouble has been stirred up, which, through Mr. Foss, has at last reached the courts and promises to be one of the most interesting test cases that has ever been tried in the United States.

Lloyd Foss, who has a gang of men cutting his birch wood for the spool mills at Somerset, while at work with his men putting out a forest fire, was attacked by this moose several weeks ago, and as a result the whole crowd had to seek the tree tops for cover and protection. After staying in their uncomfortable positions for several hours after dusk, Foss, who had a gun, shot the moose, and now a warrant has been issued for his arrest. Foss does not propose to pay either the $1,000 or the four months' jail penalty, and has engaged Walton & Walton, attorneys of Skowhegan, to defend him at the next session. He contends that if it is lawful to kill a human being in defense of one's life, it is also lawful to kill a moose under like circumstances, and that if the State protects the game from the inhabitants it must also protect the inhabitants from the game.—Springfield Republican.

West Virginia Game.

MORGANTOWN, W. Va., Nov. 14.—*Editor Forest and Stream:* Game conditions are more unsatisfactory through this locality than perhaps they have ever been before.

We have no State law protecting rabbits and squirrels at any time, and heretofore they have been abundant, especially rabbits. Reports come in from every quarter that they never have been so scarce. As they are not migratory, there can only be one of two reasons for their scarcity—they have either died or been killed. The prevailing theory is that they have been exterminated by the use of ferrets, as these are known to be kept in some numbers, but persons who would prosecute their owners cannot locate them. The chestnut crop here is fairly good, which should assure the usual crop of gray squirrels, but they are missing. As they are migratory, and their location very uncertain, this would not seem strange.

Birds are reported by local gunners to be very scarce, and they have hardly been rewarded for the five years' close time which recently went off quail. I recently saw a fine wild turkey in the market here, which had been killed by a local hunter. There are quite a number of these gamy birds scattered through the mountains in this section, but their habitation is fast being destroyed. The cutting of timber is not now as it used to be. There was a time when only good saw timber was cut, such as would make lumber, which left a growth sufficient for the protection of all kinds of game, even deer and bear; but not so now. Everything is cut, even down to three or four inches in diameter, and when the choppers are through it is indeed a barren waste, without any attractions left for man or beast.

Glenn Hunter, a young man from here, went to the southern part of the State in October for his first outing in big-game woods, and succeeded in killing a deer.

EMERSON CARNEY.

The Huntsman.

FRESH tracks——By jove! so glad I came——Must have been something large——Hope I overtake it before the other fellows come up——What's that?——Certainly something moving there!——A crackling of brush——Thought I saw something——Yes, I did——There it is——A deer——Steady, now——Don't hurry——Take good aim——Pshaw! where should I aim at?——Guide told me last year——Oh, yes! back of the fore quarter——Of course——How stupid of me!——If it would only take one step forward——Could get a better shot then——Steady, now——Don't get excited——There! now is the time!——(Bang!)——By jove! ran away——I'm sure I hit it——Won't get far——Yes, I hit it——Here's blood——It's wounded——Wonder who that man is——What am I doing deer?——Hunting deer, of course!——What's that?——No deer within a thousand miles of here?——Well, by Jove! that's a good one——Just shot a beauty within a thousand feet——It's left its trail behind it, too——Come help track it down——It went this way——Here's more blood——Must find it soon——Couldn't get far——Badly wounded——Think I see it down in that little hollow——Yes, I do——There it lies——Bravo!——Hurrah!——I got the first one——Won't the other fellows be sore——By Jove! it's a big one——Looks a little funny——Horns; but no branches on them——What?——What's that?——An old brindle cow!——Well, by Jove!

H. MALCOLM.

Woodcock and Bass.

WEST HAVERSTRAW, Nov. 13.—In my note on flight of woodcock, etc., in your issue dated Nov. 15, "Labor Day" should read "Election Day."

There are also a number of errors in "Stray Notes on Fishing." Bass feed more freely, not fast more freely, as the temperature of the water rises. As the date was omitted, the notes on condition of streams and trout taken last week, are rather shocking. Please correct.

THEODORE GORDON.

Hints and Wrinkles.

Readers are invited to send for publication under this head hints and wrinkles drawn from practical experience, and pertaining to shooting, fishing, camping and outdoor life.

No. 5.—Waterproofing Cotton Goods.

NOT a few novices at camping, as well as old hands, fancy that only the heaviest canvas or duck is suitable for tents, when as a matter of fact bleached muslin, treated in a simple manner, will turn water as well as a rubber blanket; while it is far lighter in weight and smaller in bulk than is duck. But as a general thing the lightest material which is suitable for tents is drilling or something like it, for heavy winds and constant wetting and drying are too much for the weaker goods.

The paraffin waterproofing process is simple. All one requires are, a varnish brush, some turpentine and a bit of paraffin. Dissolve the paraffin in the turpentine until the latter will carry no more, it being best to cut the wax into small bits or shavings, so that it will dissolve rapidly. Stir often. A tent or an awning for a tent can be waterproofed while it is in camp, but it should be set taut, to enable one to apply the brush properly. Otherwise the goods may be spread on a clean board floor and treated. The solution is applied evenly over the goods with the brush, then they are hung up in the sun to dry, when they are ready for use. On khaki, canvas, or other brown goods, no change will be evident, only the goods will feel less pliable than before treatment.

An old white duck tent, dyed with two packages of diamond dye, color seal brown, then treated with paraffin, will fade but slightly on exposure to the sun, and should leak not at all. Canvas hunting coats can be rendered far more serviceable by treatment after this manner, and I think it was Frank T. Bullen, the talented author of that weird old sea yarn, "The Cruise of the Cachalot," who recently told, in one of the British sportsmen's papers, of treating an ordinary woolen top coat in this manner for wear on damp days in his rambles afield.

There are few articles in a permanent camp so useful as a fly, or awning, of whatever shape or size. One of these, if made of common muslin and treated with paraffin and turpentine, will turn water well, and be far less cumbersome to stow or transport than the canvas article. An awning of triangular shape can be set with less trouble than any other—as a shade or shelter for the tent or as an independent shelter for the camp table. It may be set in a dozen different ways, with or without poles, if it has a grommet in each corner. The process of dyeing will cost the princely sum of ten to thirty cents, according to size of goods. PERRY D. FRAZER.

"Dogtown."

A MOST interesting story of home life, with the dogs and their doings, in their humble capacity as companions, pets, guardians and friends, is "Dogtown," by Mabel Osgood Wright. The title page gives the key to the theme of the story, "Dogtown" being some chapters from the annals of the Waddles family, set down in the language of home people. The author adheres to a normal and pleasing portraiture of happy home life, with its commonplaces and events set forth much as they actually happen in life with the dog associated as humble companion, pet, guardian and friend. It is pleasingly written, with good common sense treatment, conspicuous throughout. Most authors, in attempting a story in which the dog takes a conspicuous part, deem it the proper course to utter some good round denunciation of mankind with a smart antithetical praise of the dog in the way of establishing the superiority of the latter, a favorite piece of mawkish sentimentality being "The more I see of men, the better I like dogs." "Dogtown" treats of people and dogs in a wholesome way, with a pleasing story of the life of the dog as it relates to himself and as associated with family life, of interest from cover to cover. Published by the Macmillan Company.

Sea and River Fishing.

Fish Migration vs. Fish Propagation.

In recent articles upon migratory fish the writer adverted to the unquestioned fact that the finny voyagers returned, not only to their native stream, but to the very spot of their emergence from the parental ova. He moreover contended that the migrants of a particular stream had a fixed marine abode within the limits whereof they maintained a distinct and separate existence. In further support of the latter contention may be adduced the fact that migratory birds appear to have a localized winter habitat, and that the distribution of a species with relation thereto may be as wide as that incident to its breeding season. The associated departure and return of swallows, for instance, may be accepted as evidence that they keep together in southern climes, restricting themselves to a certain area, just as they do elsewhere. The migration of birds and fishes are so similar in operation that an identity of habit in this particular may be predicated of each great division of the animal kingdom; thus we know that the young of birds set off alone upon journeys of wondrous magnitude, being probably, as with fish, guided by an effective perception of their distant bourn. The voyages of both the finny and the feathered pilgrims are accomplished in varying degrees of obscurity and darkness, for the aerial traveler holds, often by preference, his certain course beneath the night's mysterious pall.

It would thus appear that the salmon fledgling, like the young bird, undertakes its initial voyage with a certain inherited perception of its proper course, but whether this perception exists as an undivided whole, or whether it is evoked, at different stages of the journey, as separate links of a continuous chain, is a matter for speculation. Not improbably, upon the fish's emergence from its native stream contact with salt water may stir into activity the appropriate instinct, just as a mosquito, despite the fact that it, together with generations of ancestors, may have been innocent of blood and unoppressed with a desire therefor, may develop, with a consciousness of its existence and direction, an uncontrollable attraction thereto. If, under the circumstances alluded to, the ancestors of the descending fish fry are "to the manner born," if they are the product of ova deposited by parents that are natives of that particular stream, then they may be assumed to possess the necessary equipment for their marine voyage. If, on the contrary, they are the product of an artificial hatching of the ova of alien fish brought from another and distant stream, then upon their encounter with the great ocean there may be awakened in the tiny wayfarers either a chain of delusive instincts or none at all. In any event, the particular perceptions incident to the locality are not evoked, for they are not possessed; thus, in every sense, the little wanderers are "all at sea."

The thraldom of an inherited instinct of direction would go far toward explaining the failure of every attempt to elsewhere establish the quinnat or king salmon of the Pacific. Probably over a hundred different tributaries, great and small, of the Atlantic, have been abortively stocked with the fry of this magnificent fish, and equally with our own country has the result been disappointing in Germany, France, Austria, Great Britain, and in the Southern Hemisphere. The Pacific salmon in habit, in strength, and capacity, is so nearly identified with its Atlantic congener that each should readily thrive in the waters of the other. What affords sustenance to the one doubtless does so to the other; but the fry of the native salmon, upon breasting the ocean's brine, is probably guided by an inherited perception of distant feeding grounds, whereas the forlorn progeny of a fish foreign to the tributary that is descended, possessing an unserviceable stock of inherited instincts, may be doomed to destruction. This may be illustrated by the salmon of the Yukon River, which great stream empties into the Behring Sea. The young fish probably attain the river's mouth in the fall, but the icy waters of the inclosed sea that thereupon confront them afford no fitting abode or nourishment. Beyond that sea's inclosing barrier—the chain of the Aleutian Islands—are the waters of the Pacific Ocean, enriched with countless myriads of organisms, borne northward by the Kuro Siwo or Japan current, the Gulf Stream of the Pacific. Upon the extraordinary richness and abundance of these lower forms of marine life is based that of the larger creatures. Nowhere else in the world exist such teeming multitudes of cod, salmon, herring and other fish, unsurpassed also are they in size and condition. To this marine Canaan, this abode of plenty, do the migrating fry, in all likelihood, instinctively bend their way. Seven hundred miles distant from the river's mouth are the passes of the Aleutian Islands, and probably through one particular gateway, and over one invariable pathway do the trustful little pilgrims attain the abiding place of their elders. Not unlikely the Atlantic salmon possess an inherited cognizance of like oceanic feeding grounds that may be hundreds of miles distant from their native streams; but which would manifestly be unattainable save by fish inheriting an associated instinct of direction.

The successful introduction of the Atlantic shad and striped bass in Pacific waters may be assumed to afford evidence that either such instinct of translation does not exist, or that, given facilities of ample subsistence, its possessor may readily conform to entirely novel surroundings. Such conclusion, however, would seem not to be in full accord with some peculiarities in the behavior of the transplanted fish.

The shad, a migratory fish in the Atlantic, has, as a Pacific exile, become substantially the reverse. It clings to the coast, and every day in the year is present in San Francisco Bay. Moreover, it seems bent upon exploring the coast, and is now diffused along its margin 1,300 miles, from the waters of Southern California to those of Alaska; and this diffusion was accomplished within a period of less than twenty years. It is not the habit of the Atlantic shad to so disperse the fish of one section apparently abiding therein. The menhaden, like the shad, is a member of the herring family, and a Maine fish is distinct from a Southern fish, and each from a fish of the intervening section. Again, the herring family are comparatively feeble swimmers, and therefore are presumably unadapted to the roving life of the mackerel, bluefish, etc. What then, it may be asked, has induced an apparent change of habit? Why have the expatriated fish become so erratic, so unfixed in their new abode?

For thousands, possibly for tens of thousands, of years each successive generation of their ancestors have traversed the same routes between fixed and familiar points. If their descendants in alien waters retain a glimmering consciousness of ancestral paths and abiding places, they would naturally cling, as they do, to the coast, for to go seaward would be merely "dragging a lengthening chain." So, too, it may be reasonably assumed that their wandering along the coast, as though seeking an eastern passage, is also an operation of the ancestral instinct, a species of congenital nostalgia.

The persistence of a migratory instinct that has ceased to be of service is shown in the Scandinavian lemming, that once in eight or ten years betakes itself in a straight line for the sea, swimming lakes, rivers, climbing mountains, and on reaching the coast, swims outward until whelmed beneath the salty wave. Scandinavia, geologically speaking, is of recent elevation, and it is inferred that the ancestral swarms set out for fertile meadows now covered by the restless sea. It is certain, however, that a migratory instinct survives that is of no apparent advantage to the species, and so is it also with the erratic migrations of squirrels, rats, field mice and other rodents; seemingly undertaken without motive and accomplished often without beneficial result. Thus the altered habit of the Pacific shad may persist indefinitely, for it is probably the operation of a rooted instinct seeking its wonted accommodation, and in conclusion it may be said that, however skeptical fishculturists may be as to the existence, in anadromous fish, of an instinct of special direction, the presumptive evidence is sufficient to warrant a restriction of propagative effort to spawn that is native to the stream that is sought to be stocked.

A. H. Gouraud.

On Lake Champlain.

A walk to Flat Rock, some three miles south and well inland, for a view of the eastern Adirondacks had been planned, but Sunday restfulness and a misunderstanding of time and place of rendezvous resulted in my return to the house from the post office only to see two of the girls rowing far out on the lake, Baker in the so-called office writing his diary, and the rest of our group nowhere to be seen. What to do? Some one asked me if I were going a-fishing. Even while answering, "Not on Sunday," the opposite determination flashed into my mind, and in a very few minutes I was on my way down the cliff to the boat house on the beach, rod and landing net under my coat, reel, line and trolling spoon in pocket and just a zephyr of guiltiness making a ripple of unrest to pass over the surface of an otherwise peaceful soul. Guiltiness in deserting the others of the party who might feel reproachful at my neglect and unrest in anticipation of fisherman's luck and the reputation among pious friends as a Sabbath breaker. One of the light St. Lawrence skiffs was lying on the beach at the water's edge, a can of worms was ready in the boat house, and once I was aboard and rowing up the coast, nothing but happiness was possible. Beside me the waves were plashing on the sand at the foot of the cliff, while out on the great inland sea whitecaps were dancing merrily and far to the east the Green Mountains lay, watched over by great Mount Mansfield and the Crouching Lion. Beneath me the hard sandy bottom, shelving gradually out into deeper water, was easily visible, with its wavelike corrugations.

A fair wind and an easy row brought me to the fishing grounds in twenty minutes, and letting my oars rest in the water, I jointed the light steel rod, rigged line and trolling spoon, put a generous gang of worms on the hook and threw the line over the stern, when the landing net had been set up. Then taking up the oars, I pulled leisurely along, with the butt of the rod on the bottom of the boat before me, its tip out over the stern. Letting out a little line, the spoon began to turn and pull. The friction of the reel's click allowed the line to be paid out until about 100 feet were gone, when by putting on the drag, the reel was held from turning until a strike might come.

The fishing grounds are about a mile above the village of Port Kent, in a bight formed by a westward trend of the shore, which makes out a half mile or so toward the Vermont side. Into this bight empty the two mouths of the Au Sable River, some distance beyond the fishing grounds. A pulp mill on the river just above the famous Au Sable Chasm has polluted the water of that stream so that there is not a fish in it. On the beach at the most protected part of the bight is the camp building of the Mountaineer Fishing Club, of Keeseville, a village of some size four miles back in the mountains. This club house is used as an outing rendezvous by the families of members, but now it was closed. Painted a yellowish brown, it is the principal landmark for finding the place to troll. Directly before it, and about 350 to 400 yards from shore, grow a patch of pickerel weeds in eight to ten feet of water, and not more than half an acre in extent. Their waving lengths are easily seen rising to a foot or so beneath the surface, except when the lake is rough. Here and there in a flat calm, the tip of a weed is seen upon the surface.

Among these plants lurk good-sized pickerel and pike at all times of day and in all weathers. The plants are not so densely placed as to foul the hook often, and it is only necessary to troll properly over them, back and forth, to find good sport. On the various occasions when I have fished here I have encountered calms and winds, light and strong, and from all points of the compass, but each time have made satisfactory catches.

To-day, by the time I was in readiness for work, the sun was bright, but a strong wind was blowing from the south-southwest, the waves were running high, and whitecaps were all about. The course over the weeds is parallel with the shore line, and took me before and against the wind. Going free, the light craft was blown along so rapidly that it was necessary to back water gently in order to preserve proper trolling speed; but against the wind it was a long pull and a strong pull. Four or five times I passed to and fro, keeping a lookout for weeds, but without seeing any, and of course getting no strike. At last I struck the spot, and found cross-bearings on shore to the southwest, which would help me to locate it on succeeding trips, and just then the reel began to sing, and life was real. This time a half-pound yellow perch was the victim, and was lifted aboard with the line without much ceremony. On the next passage across the weedy spot I had a strike which made the reel screech long and loud. Dropping the oars, which were held by pin oarlocks, I grabbed the rod and checked the rush of the game only long enough to feel its power and weight, when the line suddenly slacked, and it was gone—probably with a good-sized hole in the side of its mouth to let pass with each breath water before it had paid its toll of oxygen. This was on the windward trip, and before I could or did reel in, the boat was blown back toward the bait so quickly that the latter had sunk to the bottom and caught in the weeds. By the time the hook was clear and clean again, I was far out of my course toward the south branch of the river. Hereafter I was contented to fish but one way across the grounds—down the wind. Going to windward, I would reel in and keep the bait aboard, and struggle against wind and wave back to the starting place.

The next time across I hooked the mate of the perch, already caught. I said things to him, as did Hiawatha to Nahma, and called on the king of fishes, daring him to strike.

Again I hooked a pickerel of about two pounds in weight, and again I lost. This time I had brought him alongside and saw him glare wickedly at me, as only pickerel can, when all of a sudden a mighty shake of his head wrenched the hook from his mouth and actually threw it into the boat beside me. "Take your cheating old worms and be hanged to you," he probably said, as he disappeared.

But here was encouragement, and though I had a lurking suspicion of the approach of dinner time, I stoutly refused to look at the watch in my coat under the bow seat, and resolved to fish that patch until something was flopping in the bottom of the boat that might be heard without an ear against the gunwale.

On the second trip against the weeds after that I was wondering if I could light a pipe in all that wind, when Z-z-z-z-z-z! screamed the reel. I picked up the rod, pressed thumb on reel and attempted to reel in. Whew! how he does pull! He is well hooked! Oh, the joy of it! What of patients, affairs, business now? Who shall win this struggle? There he goes—far out of the water he jumps, his sides gleaming and the drops falling all about him as he shakes himself through his plunge into the air. This dash is unavailing—the hook holds, and now that I have seen his thirty long inches, I know there is a long fight ahead if the light tackle is to hold. Here he comes rushing toward the boat, but not a slack inch of line does he get, for the boat is drifting away from him, and the reel is a quadruple multiplier. After this he sulks and allows himself to be slowly and laboriously reeled in, until he gets sight of the boat, and the strange monster in it, both of which are surely connected with that strange thing sticking in his mouth and that mysterious and maddening tugging which for the first time in his life prevents him from gliding as free as light through the water. Then off he darts far away toward the more friendly Vermont shore. Nothing could stop him, save such a bolt rope and tackle as the pot-fishermen hereabouts use; certainly not this eight-ounce rod and thread-like line. But at last he stops and again allows himself to be reeled in until near at hand, when with another great lunge, he shoots directly under the boat, and heavens! the tip with him. Just in time I pass the rod around the end of the boat, but scarcely is it safe before he darts back to the other side again. My heart stands still—he'll break that rod yet. Three times he rushed arcoss the keel, and each time I managed to save my tackle. After this, one long run played him out. He floated on his side as I reeled him in, and lay quietly while I passed the rod back, grasped the line above the tip and shoved the landing net under and in front of him and quickly lifted him aboard with certainly a third of his length projecting from out the net's mouth. Once aboard and dispatched by a blow on the head, I had scarcely time to admire his size, his beauty and his glance, wicked even in death, before the sound of breakers close at hand brought me to the realization that I had drifted away up the lake and close inshore. Quick moves were necessary in getting the oars shipped—I had taken them both into the boat during the lulls in the fight—and getting under way for home.

The wind and the waves made the row home a long, hard pull, and there was no opportunity to light my pipe, but it was sweet to look at that big beauty there in the shade of the little deck at the stern.

W. S. T.

Trout Tickling.

Washington, D. C., Nov. 14.—*Editor Forest and Stream:* Mr. Chambers' interesting notes are always enjoyable, but his article about tickling trout in the paper of Nov. 15 calls to mind an experience of one of the employees of the U. S. Fish Commission, when collecting eggs of the lake trout at Lake Dunmore, Vt. A number of adult lake trout ranging from seven to fifteen pounds in weight were in a partially submerged open boat, in which they had been towed to a convenient point for stripping them. One of the employees quietly placed his hand under a large female and tickled the belly of the fish. The fish remained quiet for an instant, then darted suddenly to the other end of the boat, turned about, and returned to the point from which it had started, where the man still held his hand. He then proceeded to tickle the trout for some little time. This showed beyond all question that the fish enjoyed being tickled. I do not see how any poacher or fisherman could ever exterminate enough fish by this method, however, to necessitate any special legislation. In fact, I should think it would be a pretty slow method of catching fish.

Jno. W. Titcomb.

A Pearl River Camp.—V.

(*Continued from page* 390.)

"THIS business of hustling all the time for meat and going without bread, has ceased to be funny, and feels to me very much like work, and hard work at that," said Jim, as we opened up the usual discussion as to how to get our dinner.

"Yes," said Will. "When you have to do it, fishing is no fun at all, and hunting is no better than hoeing corn. Let's dig out for a day or two and go somewhere and fill up and then come back and have some fun. I am hungry all the time, even in my sleep."

"That is all right enough to talk, but where can we go to eat?" said Walter.

"There is not money enough in the crowd to fill us up on hay, if we could eat it, and if any of the natives about here have been around begging the honor of our company to dinner, they have spoken very low. It is no use to grumble about being hungry, and having to rustle for grub, for there is but one other thing to do if we can't stand it."

We knew he meant give up and go home, but not one of us was yet ready to contemplate the humiliation of sneaking back, starved out and discouraged, after the big talk we had indulged in; to say nothing of having insisted so on being left to our own resources in the matter of providing provisions.

After some further discussion we concluded to try the white perch and trout, and loading our minnow seine into the boat, repaired to the river to catch minnows. On a sand bar near where we were seining, I found a peculiar track made by some animal with claws, that seemed to have a heavy tail that made a deep mark.

I could not tell what it was that would make such a track, but Walter recognized it at once and pronounced it an alligator, and a large one.

We were greatly excited by the discovery, believing that alligators were very fierce and dangerous, and, although we had only a few minnows in our bucket, concluded not to tempt fate by further seining in that water.

Our fishing was not at all the success we hoped for, and any one of us could have eaten alone the entire catch of the morning. It was a sad and silent crowd that toiled up the bank from the boat, carrying our scanty supply of fish, and bearing in grim silence our hunger.

"Hullo! Company," said Jim, as we came in full view of the camp, and saw seated on a stump by the ashes of our fire a large, bearded man.

"Walter's friend," said Will. "Come to ask us to dinner."

As we approached our vistor he arose from the stump, dropped a double-barreled shotgun carelessly into the hollow of his left arm, and stood facing us. He was a very large man, of rather forbidding mien. He answered our polite salutations in a short, gruff manner, and immediately began to catechise us.

"Where you from?" he asked.

We told him.

"How long you been here?"

This question we also answered.

"Anybody else been camping around here since you come?"

We said they had not.

"Have you seen anybody around since you been here?"

We answered this in the negative, and the questioning ceased for a time.

The man's manner was abrupt, and his attitude rather truculent, but we were self-reliant boys, and not easily frightened, so felt nothing but a vague uneasiness from his visit and questions.

When the silence had lasted so long that it was growing embarrassing, Walter said:

"Was you looking for anyone in particular, sir?"

"Yes," he snapped out, with an oath. "I am looking for somebody allfired particular, and when I find him and give him the eighteen buckshot that I have got in this here gun, his infernal hide won't hold shucks."

The gentleman was plainly in dead earnest, and somebody was in danger of suffering great bodily injury.

We were divided between a feeling of sympathy for the unknown's danger and curiosity as to his offense.

"Well, we haven't seen a soul since we came here," said Walter. "What kind of looking man is he you are hunting for?"

"I don't know," was the reply. "Never saw him yet, but I will see him if I have to hunt a year. It is a —— thieving scoundrel that has killed one of my best hogs that I am after, and I'll shoot him just as quick as I get sight of him."

Will had stepped to the water bucket for a drink, and had the dipper almost to his mouth when our visitor spoke of the hog. I was looking at him and saw him freeze with his mouth open, and the dipper a few inches from his lips. His hat plainly moved on his head, and great drops of sweat broke out on his forehead, while he gazed at the angry man like a snake-charmed bird.

Fortunately, our visitor was not looking at him, so did not see his look of conscious guilt.

"How many hogs have you lost?" said Walter, evidently to create a diversion and let Will recover from his panic.

"How many have I lost? Do you suppose I have been sitting around letting a dad blamed hog thief rob me as he pleased? I've lost one hog, and a fine one, and when I catch the thief—as I will—the coroner will be his next visitor."

I glanced at Will out of the tail of my eye, and saw that he had not moved. We were all pretty uneasy and wishing that our visitor would take his departure, which he showed no signs of doing.

Trying hard to appear at ease, we set about building our fire and preparing our scanty dinner, while our bloodthirsty guest continued his tirade against the unknown slayer of his hog, with dire threats of vengeance. Finally, when we put on our small catch of fish to fry, and he saw how little there was, and that we had nothing else, he asked if the fish was all we had to eat. On our replying in the affirmative, he proceeded to speak very frankly and forcibly to the effect that it was foolish of us to come on such a trip without bringing provisions, and all but criminal on the part of our parents to allow it.

"You ought to have brought enough provisions to last your whole trip if you did not catch a single fish or shoot a squirrel," he wound up.

This struck Jim as being a reflection on us and our respective households, and he rose to explain:

"We did bring provisions, plenty of them. A clothes basket and a market basket full and the h—"

Walter was making desperate efforts to shut him off by grasping his own throat with one hand and pressing his finger on his lips, while I stood helpless with terror, believing that a moment more would see us facing a cross examination that would convict us as the hog-killers, for, of course, we could not let Will bear it all. But Jim got no further than the beginning of the fatal word "hogs" when Will broke in on him in a frenzied howl:

"Clothes basket full! Market basket full! Piled up, running over. Eat it all up. Eat all day, and all night. Never did eat so much. Just done nothing but eat. You never saw anybody eat so much, did he, fellows?"

Will wound up his wild harangue almost in hysterics, and it was not a bit funny.

He firmly believed that his life was in danger and was scared as only a boy can be.

Jim realized how near he had come to putting the fat in the fire, and was covered with confusion. There was a moment of silence, and then our visitor arose to his feet, shouldered his gun, and throwing out his hand in a careless gesture toward our frightened companion, said:

"If you boys ain't got sense enough to bring grub with you when you come camping out, you certainly ought to have decency enough not to bring liquor and drink it, young as you are."

We entered no denials, and were thankful to see him take his departure. He might think we were all drunk or crazy, we agreed, so long as he did not discover that we had killed his hog. There was a general sentiment to the effect that we ought to change our location immediately for fear of a return of our visitor, and it would have taken very little additional scare to cause us to abandon all our effects and start for home in a body. Will, especially, was very insistent upon leaving at once, declaring that he had rather walk all night than chance another such visit.

Our appetites had been so affected by the scare that our small supply of fish proved ample for dinner. After much discussion we concluded to at least defer our departure until the next day.

The afternoon was devoted to fishing for bream, and our success was great. Determining to atone for the short rations we had been on, we cleaned the entire catch, which more than filled a large bucket, and prepared for a real feed. The bacon was sizzling over the fire, and we had meal spread on a board to roll the fish in to prepare for frying, when a loud "Hello!" was heard on the opposite bank of the lake. Our friend of the afternoon was the first thought of each one, and our hearts sank.

After a hasty consultation Walter and I went to investigate the hail, leaving the other boys to look after the preparation of supper. Will's parting injunction was: "If it is that bloodthirsty old pirate, and he comes back with you, I will be in bed and you can tell him I am sick, and it will be perfectly true."

Arriving at the lake bank and replying to the hail; we found our would-be caller Bob Weston, a cousin of the Kirkman boys, whose home was a few miles away, and who had come over to visit us. We soon had him ferried across and up to camp, where he received a most hearty welcome, owing partly to the relief we felt and partly to the fact that he was the bearer of two large loaves of bread sent us by his mother. He further won our deepest gratitude by the assurance that he was acquainted with our friend, the hog owner, and knew that he was to go to Yazoo City the following day to be gone two weeks. This good news, the abundance of food—especially the bread—and our welcome young visitor acting altogether, made us so hilarious and hungry that we ate every fish and all the bread for our supper. Bob proposed to initiate us into a new order of sport after supper, and we set to work on our preparations.

He had brought what he called a fish gig and proposed to take us on a gigging expedition by torch light. The gig looked like a trident, as shown in the pictures of Neptune, being a three-tined fork—the tines barbed—set on a long handle.

Gigging, as he explained to us, was practiced by wading along in the shallow water after dark among the cypress roots and trees, with a torch made of pine knots, by the light of which you could see the fish and strike them with the gig.

"How about snakes?" asked Jim, when Bob had explained his method.

"Hardly ever see one at night, and they won't bother you at all."

This was good news to me, as a snake was my pet aversion, and I had thought at once how apt we would be to run on them. We found gigging very exciting, but not as easy as it looked.

Bob struck several fish to show us how, and then we each took a turn. The pine torch gave a good light, but the fish did not look right in the water.

We were not much troubled by the refraction, usually the most serious difficulty in spearing or striking fish in water, as we worked only in very shallow water, but the fish would not look right.

My first strike was a root into which I drove the gig with tremendous force to the great consternation of a large fish that lay almost against it, the root having presented the exact appearance of a fish to me, and vice versa.

We novices made many mistakes, but occasionally took a fish, which was all the more enjoyed, owing to the difficulty we found in mastering the sport. We finally had to quit, owing to the fact that our torches gave out, but we carried back to camp the best string of fish we had yet taken.

Walter struck the largest fish sighted, which we all took a hand in landing amid great excitement, but only to find that it was another one of the beady-eyed species that we had found worthless. Bob called it a grinnel and pronounced it unfit for food.

We were very tired when we returned to camp, but as Bob was compelled to get back home early in the morning, we prepared a generous mess of fish for breakfast before turning in.

Nothing disturbed our rest, and we slept—five in a bed—as only healthy tired boys can.

LEWIS HOPKINS.

An August Outing.

Editor Forest and Stream:

One day a few weeks since, while gazing from my office window, watching men and maidens coming from beach and mountain laden with that healthy brown shade which comes only with the good old summer time, there dropped in upon me a couple of friends, with an "Hello, old man, what are you dreaming about?" "Nothing in particular," I replied, "just enjoying the healthy glow I see passing, but, unfortunately for me, carried by the other fellow. It just makes me wish I could get away for a few days." "Well, why not?" they said. "That's what we are here for—all tired out and want to go somewhere. Now, you know where to go. Start and take us with you, away from railroads, letters and newspapers, into the woods, near the end of some distant point, where we can commune with nature for a week, shake off this tired feeling, and be able to brace up a little." "All right. When shall we depart?" "At once." And so, with hardly a thought of the matter, or where we were going, I consented to take my friends to some jumping-off place, where the noise of the grinding trolley could not penetrate.

The arrangements were left to me. In fact, I was duly appointed guide, and told what was expected of me. I was to pilot the party to just the proper place, amuse them with stories of my previous experiences—fact or fiction, mattered not to them—provide for their comfort, and, above all things, see them safely home at a given time, with life preserved and health improved. No small undertaking, I assure you, as both my friends are charter members of the "Tenderfoot" and "Kicker" clubs, very inquisitive and willing to learn. Looking into the muzzle of a rifle barrel, or casting a fly around a fellow's neck was all the same to them. They wanted a good time, and were bound to have it—taking chances being part of the programme.

I may as well introduce my friends—just plain Billy and Sam. They are fast friends and both good fellows—yes, mighty good fellows; and the way they "call" each other on various occasions is amusing, but let some other fellow mix, and there is trouble at once. Billy is in the hotel business. He knows all about running a hotel—or thinks he does—which is the same thing, and the spread he prepared for us for a send-off the night we left was well appreciated when later we sat down to tin plates, and the smoky food prepared for us by our Canadian guides. Sam turned his face toward the setting sun and thought of old Boston and her famous baked beans, but it was no use to think—eat or go hungry, and Sam faced the tin plates with the crowd.

Now, about Sam. Well, he is a lawyer. He is not a Webster, and says he is glad of it, for he would not care to have his picture hanging in every legal office in the land. This may seem strange, but if you could know Sam and his bashful, retiring disposition, all would be explained. But Sam is all right—only one failing, just a little gun shy. He did not enjoy some of Billy's military movements with a rifle, so one morning, when Billy came up the lake and made a good shot at a loon, Sam asked what he was shooting at. Billy said he was after a loon and got one right in the head. "That is nothing," said his bosom friend, "you have had one there for years," but he was sorry for this soon after. While passing through the woods, Sam was a short distance in the rear. Billy and I stopped behind a clump of bushes and watched him hunt the trail. "Wait for me, Billy," was the cry we heard, and when he came in sight that frightened, lost-in-the-woods looks on Sam's face was a picture no artist could paint.

But, enough of the boys for the present.

"Cummings' Camp, Square Lake, Maine, the home of the largest square-tailed trout in the State." That is the way the circular reads, and probably every man who has fished this famous chain of lakes has seen fish beauties usually found only in pictures. This was our destination. We left Boston one Sunday night. Monday morning found us at Bangor. Here we took the Bangor & Aroostook train, arriving at Jemtland at 2 P. M. Jemtland can boast of only two buildings, but it is surely on the map. Here we were met by a young man who was to drive us to the first camp, some twelve miles distant. The roads were somewhat rough, owing to recent rains, but at 5 P. M. we reached Camp Ranch-to-Rest-In on Cross Lake, safely, with no broken wheels nor bones. We were welcomed by Mr. D. L. Cummings and daughter, who had provided for us a supper such as only a tired traveler can fully appreciate.

Tuesday morning we started for the main camps, eight miles distant by canoe, situated on Square Lake, and here is where I lost my job as guide. Billy and Sam did not propose to take any chances in a canoe with me as propelling power, so, with cool repudiation of my contract as guide, three Canadian boatmen were engaged, and off we started. I will not attempt to give the names of these guides, beyond Frank and Pete, as I would surely make a mess of it. Anyway, they knew the lakes, and could handle a canoe, which was quite a necessary accomplishment for our party.

At Square Lake we found Mrs. D. L. Cummings and Mr. Fred Cummings in charge, and with a characteristic Maine welcome, we were assigned to a comfortable camp and told to make ourselves at home.

Wednesday morning bright and early we started on a cruise of some seventy or eighty miles. A ten-mile paddle took us nearly the length of Square Lake, and into the Dimmock country, which, by the way, is where the moose are full-fed and grow large. It was no uncommon sight to see two or three moose feeding at the water's edge, careless of our presence, but the first crack of a rifle will soon warn these great game animals that the season of their discontent is at hand, and if they are wise, they will hasten to the nearest blacksmith shop for a set of high-gear traveling shoes.

After lunch and a pull at the brier, we again took to the water. Down Square Lake, through Eagle Lake thoroughfare, across Eagle Lake, then up Fish River, and camped for the night at the foot of Lake St. Froid. Here again was the courage of the tenderfoot severely tried, with another introduction to tin plates and camp-fire cooking. While the guides were preparing our evening meal, Sam was busy putting in several vigorous kicks from his seat on the smoky side of the fire. I shall always think that he was communing with the spirit of the departed Poe, for I surely heard him say "Nevermore." Leaving him to his own reflections, Billy and I wandered up the lake shore and in about half an hour returned with wet feet and a dozen pairs of fat frogs' saddles, and this was how it happened that our bill of fare for breakfast was made more tempting by the addition of frogs' legs, à la Boston. That long-to-be-remembered breakfast over, a little fishing was in order. We were not long in locating the finny beauties that were to furnish our midday meal, and had it not been that we wished to leave a few for breeding purposes, the sport might have continued indefinitely.

Going back to camp, a big trout nearly jumped over Frank's paddle. "Feesh of'en jomp in canoe on this lak'," said Frank. I glanced backward at his wrinkled face, but he gave no sign that the truth was not his specialty. I said nothing, and doubtless Frank concluded I had fished in other days, for he gave me no further information of a similar nature.

That night found us back at Square Lake Camp, which, the boys had decided, was more comfortable, for the night in the tent had not been a pleasant one in all respects. A friendly owl had also camped quite near us. Sam thought it was a bear. He sincerely hoped to see its black nose poked under the canvas near where Billy was dreaming of a beauty, but no beast.

Friday was occupied making a trip up the lake to Little Goddard Brook. Here words fail to fully describe this beautiful stream, with its winding course and ever silent shores. No sound broke the stillness, save the waters drip from the glistening paddle. We rounded each bend silently, wondering at every turn what new scene would present itself on this great panorama of nature; but not until the canoe grated on the sand at the trail landing was our watchfulness rewarded. There, standing in the tall grass, their great dark bodies silhouetted against the green foliage, we saw three large moose. This was a sight well worth the paddle of hours, and the entire cost of our trip. It is said, a moose is very intelligent, and it certainly seemed as though they had read the full text of the Maine game laws, and knew we could not harm them, for they viewed us with evident curiosity, and finally pushed their way into the heavy growth and disappeared in the forest.

Our party continued up the trail some three miles to Camp Gilmore, a charming little resting place that one must know in order to find. Here was served lunch—boiled eggs, sandwiches, fresh blueberries picked en route, and a cup of genuine forest-made coffee. Now, a Maine guide would as soon forget his dinner as he would his after-dinner smoke, and some sports are inclined the same way, so our smoker lasted nearly two hours, there amid the deep forest. Billy and Sam entertained the circle with many fairy tales of unusual interest, some of which would have done credit to our old friend Ananias, but were vouched for as positively true. Days of this kind pass all too quickly, and the gathering forest gloom warned us back to camp.

Saturday came too soon—our last day at this delightful lakeside home. The day was well improved on the water, up Big Goddard Stream, around to the pleasant Barstow Camp, then over the trail to the head of Eagle Lake, where the sparkling water, rippling over the glistening sands, gave us a tempting invitation for a plunge, which was gladly accepted.

Monday we had prepared for our start to the Hub. The morning was chill and misty. The teams had been engaged, and as all hotel and law business in Boston seemed to be at a standstill. Sam and Billy decided they must at once return to the haunts of men to put things in motion. That was a muddy twelve-mile drive, but no matter, it was enjoyed all the same, as well as the sights and scenery along the famous Bangor & Aroostook road, to Bangor. The mantle of night had fallen when the train pulled out of the Bangor station, and three tired fellows sought their berths.

Tuesday morning we landed in Boston, back again from a most delightful trip, and over our breakfast coffee we took a vote. Up went six hands, in favor of another journey into the forest when business would permit; and thus ended safely, a delightful August outing, for Billy, Sam and the Guide.

ROXBURY.

Fish and Fishing.

The Weight of Fishing Rods.

MORE than the ordinary amount of comment aroused by statements published in FOREST AND STREAM, has followed the remarks made a few weeks ago by Mr. Hough, relative to the weight of fishing rods. Over and over again have I heard references to the matter by anglers who take a special pride in the quality of the tools which they use. The unanimous opinion of those who have had the most experience in experimenting with various styles of rods seems to be that Mr. Hough hit the nail squarely upon the head when he pointed out that something more than lightness is required in a fishing rod. As a well-known angler remarked the other day, "a light rod without heart or backbone is a delusion and a snare." Many makers who turn out rods without regard to hardly anything else than their light weight are responsible for much discomfort and lack of succes on the part of anglers. On the other hand, there is no doubt that a greater measure of success in the manufacture of rods uniting lightness with casting and killing power, has been attained in America than anywhere else. The superiority of the well-balanced split cane rod of American manufacture for trout and ouananiche fishing made itself apparent to me long ago, and a three and three-quarter-ounce tool has been my constant companion on all my inland fishing trips of the last four years. Few anglers, I think, will be found to begrudge the extra time required to kill a large fish or to save a double with so delicate and so responsive a tool as this. I must confess that when it comes to a stand-up fight with a salmon, I have usually preferred a Castle Cannell or some other stout rod of the greenheart species, because I not only know the dangers which threaten the angler's connection with his fish during every instant of time that elapses between the hooking and the gaffing of a salmon, but also because when I go afishing for salmon, it is with the intention of fighting the fish that I may be fortunate enough to hook, and not remaining passive while they fight me. What had confirmed me in this preference was the experience I had had with some of the split cane salmon rods belonging to companions with whom I had fished. Last July, however, I found out that it is possible for a light cane rod to kill a lively salmon quite as quickly as a heavy Greenheart. My friend, Mr. Hart, returning tired to camp, suggested that I should try a pool close by with his new cane rod, while he looked on. A twenty-six-pound salmon was hooked at almost the first cast. The river was between Mr. Hart and the writer, and before one of the guides could cross and bring him over to the death in the canoe, the fish had been gaffed by the other. The rod was, of course, just such a one as Mr. Hough describes as desirable for the angler's use, and I never want a better one. What anglers have to guard against, however, in buying rods, is that lightness of make is the main consideration. An expert angler may sometimes know, or think he knows, just how a rod will act by the feel of it when set up in the tackle shop. There is very much, of course, in a proper balance, and even this cannot be well judged unless the reel is on the rod, but it is always advisable to have the line run out and to take the opportunity of testing the casting power of a rod in some open space before concluding a purchase.

Change of Opinion in England.

English writers on sporting topics are now advocating the use of lighter fishing rods than those hitherto in use, even in sea fishing, and that well-known fishing expert, Mr. F. G. Aflalo tells his readers in a recent number of the Field that a light trout rod, which he advocates for angling for codling, whiting and sea bass in rivers will give ten times more sport than the stiff sea rod, which he admits is excellent for lifting the heavy skate caught off the British coasts. One of these fish was recently taken with rod and line at Ballycotton on the Kenmare River, weighing 120 pounds, and on a handline one of 163 pounds has been taken.

It may not prove uninteresting, in connection with the size and weight of salmon rods made in England to describe one which has passed into my possession. It is made of whole cane, mottled black and yellow in color, and bears on a brass plate around the butt, the name of a famous London rod maker. It consists of four joints, and there is a hollow gaff or net handle, containing the spare tips. All these parts fit into a hollow cane case three and a half inches in diameter, and surrounded by six heavy brass bands, headed by a screw-plate of the same material. When put together the rod weighs four pounds and a quarter and measures nearly twenty-three feet in length. It almost requires a giant to wield it. Its original owner was a Philadelphia man of large stature, who used it on the Ste. Marguerite and other Canadian salmon streams several years ago. I am told that it cost from £15 to £20 sterling, and the beauty of the finish shows an evident determination to turn out an exquisite piece of work. In its original shape it is better suited for a museum of angling appliances or for a fisherman's library than for anything else, but I have rendered its upper half useful by making a short butt, which takes the place of the original two lowest joints. As customary with many British rods, the ferrules are colored black, to prevent the reflection of a bright sun on clear metal frightening the fish in clear water, and probably the mottled color of the cane was contrived for a similar purpose.

E. D. T. CHAMBERS.

A Fisherman Caught.

POLICE CAPTAIN MAUDE, of the Stagg Street Station, Williamsburgh, in an effort to capture a thief who persistently visited a tailor shop in Graham Street, hid a patrolman in the place last night. Shortly after 2 o'clock this morning the officer saw a young man open a window in the rear of the shop and pass in a long pole to which a fish hook and line was attached, which, by swinging around, he was able to secure some dress goods valued at about $30. The thief repeated the trick five times, and then the policeman from the inside caught the thief's arm. The noise of the struggle brought the tailor, who went to the yard and secured a grip on the thief until the officer was able to come out. The boy was held on a charge of burglary.—New York Evening Post.

"A Vermont Mode."

SPRINGFIELD, Vt., Nov. 6.—*Editor Forest and Stream:* I am the man who described the New England fox hunt printed in your issue of Nov. 1, under the title "A Vermont Mode."

I have read in your issue of Nov. 8, under the same caption, a most beautiful "roast" by Mr. Albert Converse, of Philadelphia, Pa. If Mr. Converse had been present when I finished, you probably would have lost a subscriber. I was stunned. I, a game warden of my State, a hater of game hogs. I, who had worked so ardently for the protection of all kinds of game, was, after all, nothing but a pot hunter, a contemptible fellow who deserved this scathing rebuke. But the more I think about it the better I feel.

From the point of view of the humanitarian, the New England method is the better of the two. It lacks all the elements of savagery found in the English or Southern hunt, where the hunters, who are well enough mounted, arrive in time to see an exhausted fox torn to shreds by the wolfish pack.

From the point of view of the sportsman—yes, but there is no point; there are as many points of view as there are kinds and conditions of men.

I can readily understand how Mr. Converse, perhaps bred of a long line of fox-hunting ancestors, should look upon our hunt as a sacrilege, breaking, as it did, all the treasured traditions.

The New England fox hunter regards with the same aversion any man who would trap a fox. Although our methods are tabooed in England and in the South, we still entertain much the same regard for our quarry. A New England fox hunter will not allow his dog to follow a she fox during the early spring, and would see the last of his young chickens or turkeys disappear before he would shoot one in the summer.

With us it is a question of the present method or none at all. Hounds cannot be followed in our rough country on horseback or in carriages, and the people up here are too much occupied with the hunt for a living, to sport a pack of hounds, even if they could be used.

Mr. Converse's idea of the facility with which foxes are "potted" is erroneous. Wm. Everett Cram, in his book, "Little Beasts of Field and Wood," says: "From what I can learn, fox-hunting, as it is practiced in this part of the country, is a science that requires a great deal of study to make it a success. And the novice, though his dogs are of the best, may not even get a shot for the first season or two." This is true, and I can assure Mr. Converse that it requires both leg and head work to follow the hounds afoot. Our red foxes are so large, so crafty and their powers of endurance is so great, that no hounds can catch them among our hills. Therefore, the gun is the only means which gives hope of an occasional success, that element without which no sport can long survive. We like to hear the music of the hounds, none the less, because we only run two or three together.

Shall the nut-brown Vermont lad be denied the delight of enticing the big trout from the pool under the bridge because he has a cut pole and baits with the humble earth worm, while the man from Philadelphia throws his flies with a 6-ounce split bamboo? The comparison is fair.

If Mr. Converse or any one else can show us a better method for use in our country under existing conditions, he will be the most welcomed of men and we will not even insist on the use of the term "fox-hunting," which, however, appears to me a proper use of the English language. As to the use of smoke in the hunt described, this was an experiment tried in the hope of giving us another run. I do not for a moment deny its irregularity. The result was entirely unexpected. The other members of this hunt (I have nothing to say for myself and will leave Mr. Converse to draw his own conclusions) are gentlemen who would scorn to shoot a hare in her form or a treed grouse or catch short trout; in fact, they are sportsmen of as true a type as any other, and I know they will be as surprised as I was at Mr. Converse's bitter criticism. In the British Isles the deer was formerly hunted with horse and hounds, but the sportsmen of the State of Pennsylvania "pot" them with guns, and Mr. Converse has no more right to "jump on" me than a man who has followed the stag hounds in Scotland has to attack the sportsmen of Pennsylvania for shooting deer. It all depends on the point of view, and if Mr. Converse will give me his address I will send him an invitation to come up to old Vermont, and he will find, much to his surprise, perhaps, that we have our own code of shooting ethics, possibly as rigid as his own; and I can assure him that he will find among our sportsmen a generous consideration for the beliefs and opinions of others, which is one of the most admirable qualities a gentleman can possess. I hope I shall some day have the pleasure of meeting the enemy face to face, for between you and me, Mr. Editor, I don't believe this man Converse is such a bad fellow, after all.

W. W. BROWN.

Rabbits in North Carolina.

FOREST AND STREAM'S readers have knocked "around and about," to use a darky phrase, with the writer, in this southern country, in quest of the 'possum and the 'coon, the squirrel and the partridge, and the snipe, and now they are to be told about a little excursion after the darky's "winter friend," to wit: "Bre'r Rabbit." The rabbit is to the darky in cold weather what the "watermillion" is in summer; namely, a thing to be sought for and eaten with the greatest relish. The 'possum is more prized, it is true, but is scarcer, while "Bre'r Rabbit is ter be had fur de lookin'," as a darky sportsman sententiously remarked.

The writer must have enjoyed a thousand rabbit hunts, yet they never lose their zest and infinite variety. Each rabbit presents a new situation. The dogs and the negroes are of course as much a feature as the rabbit himself. A rabbit hunt lets out all the unctuous joy of the negro, his talk, his laughter, his shouts, and meanwhile the dogs make music which rings in the glades, romps over the hills, is returned in clangorous echoes by the woods, while the heart beats quicker and the legs run faster after that little bit of flesh and fur than they do after anything else.

The country around Raleigh is not exactly a paradise for rabbits. A negro once said to me, "De rabbit heaven is up in Chatham county. Up dere rabbits is so thick dat dey's two or three un 'em ter every brier heap." A slang term for the rabbit is "sand horse." The writer never heard it used save in this particular section. Chatham county is really full of them. They are so numerous as to be an article of trade, nearly approaching a staple.

However, the rabbits in the vicinity of Raleigh are nu-

merous enough to furnish plenty of sport, and a good bag as well. We made up one day what may be termed a sort of official party for a hunt. There were the Governor, the Secretary of State, the Auditor, the Commissioner of Agriculture, William Robbins, a large landowner and a thorough sportsman; the writer, and his young hopeful, also sundry negroes and about thirty dogs. The scene of the hunt was Mr. Robbins' 1,000-acre farm in plain view of Raleigh, the sort of place "Bre'r Rabbit" loves. Cotton, grass and cornfields, woods and those low places along little streams, with high grass, briers, alders and willows, which are rabbit resorts, are the features, and then there are patches of "broom sage," as the darkies term it, another sort of retreat for the hare.

Here are the dogs. Three of them are little grizzled fellows, with faces like those of very old men, nondescripts in the dog world, but only useful and highly prized by their owner, Ben, who says, "Dem's my shaggies. Dey's de greates' rabbit jumpers you ever seed. Dey kin run, too, but dey business is mostly jumpin' um. After dey doos dat, de udder dawgs mus' ten' ter dere part o' de business. If de rabbits anywhere de shaggies guine ter fin' him. Bet on dat! He's jus' got ter cum out o' de wilderness, en come quick, too." Three of the other "dawgs" are beagles or part beagles. Ben calls them "beagle houn's," and says "dey goes erlong wid de shaggies." Most of the dogs are the rawboned and rather large, shambling hounds, which are the darky's "best bower," and of which every country negro has at least one.

Great consideration is paid by the white sportsmen to the views of Ben and his chief assistants, who has the odd nickname of Soldier, possibly because he shirks all other work save rabbit hunting, in which sport he will go all day and lead the most strenuous life imaginable for a few drinks and the fun of the thing. The negro assistants are equipped with sticks, with which they beat and poke into every "likely lookin' place," to aid the dogs in starting or "jumpin'" the rabbits. One darky is so clever a beater that he is the first to jump a rabbit. Suddenly he emits a yell and throws his stick, and a rabbit rushes out of the edge of the marsh and right into a cotton field. The cotton has been picked, but the stalks stand thick and strong. There is the rattle and snap of the thickly ranged stalks as the dogs and the rest of us fairly surge through them. The white contingent is around with guns and quickly gets to points of vantage.

The rabbit is in his element, the cotton field. He knows exactly what he is doing. The rains and the frosts are causing a partial decay of the plants, and the acid in them, probably tannic, gives out a strong odor, which must tend to diminish that of the rabbit. Then, too, by lying down between the rows of the cotton the rabibt has a capital opportunity to use one of his favorite ruses, that is, to lie down full length, keep still, and let the dogs actually run over him. Sometimes he keeps on lying there. Again he will turn and go back, sometimes jumping several feet to one side or the other, to puzzle the dogs. Sometimes after the dogs have turned back toward him, he has the audacity to run toward them and through their lines, as most of them rush heedlessly in full cry.

Ben says: "Rabbits jes' nacherly takes ter er cotton patch. I don't rightly know why, but dey goes dere, sits still en saws woods, minds dey own business, er mebbe lies down, keeps right quiet en lets de dawgs run right over um. De dawgs is crazy ter git de rabbit. Keepin' still is what saves de rabbit. Watch de shaggies. Dey's trying ter jump him ergin. Watch ole Blue, dat big houn'. Dat udder big houn' by him is Lawyer, which I calls him because he makes such er fuss all de time like lawyers en de cote house." Ben grins at his own joke and whoops up his dogs.

The dogs make all kinds of turns and returns in the cotton patch. Presently the writer gets a glimpse of something moving. It is "Bre'r Rabbit." A snap shot knocks him over, but when the spot is reached he isn't there. The dogs go at it again. A minute later some one sings out, "Why, here he is," and sure enough there lies the rascal, stone dead, in a clear place, seventy-five yards from where he was shot.

The rabibt is held up so all the dogs can see him, as they are called up. Otherwise, they would not go after another rabbit without much delay. The darkies are given a dram, which they take with great relish. It is not considered good form in rabbit hunting, as in 'possum hunting, to take a drink until the first game is bagged. After that there is no limit. "Let's draw down to'ards de branch ergin," says Ben. "Dey's lackly ter be ernuther un um in dere. If not, den dey's sum en de hillside in de broom sage. Dey likes dis place, 'cause yander's er callard patch, en some turnips is close by."

Up gits another rabbit. One of the shaggies jumped him, and Ole Blue and Lawyer are leading the chase. He goes into the cotton patch, but so close are the dogs that he has to keep on running, so he makes a detour of perhaps a mile. Meanwhile Ben posts the people with guns, so as to head off the rabbit at the best points for getting a shot. But at this rabbit no shot is taken. The dogs have him, and Old Blue fairly tosses him into the air, while Ben has to rush in and snatch him from the dogs, to which he administers various and sundry kicks and cuffs, as they are trying to eat him.

"Dem shaggies shorely can run er cold trail," says Ben. "Dat track dey's on was made last night, erfore daylight. Here he goes!" ending with a yell. "Dat's er buck rabbit, de old he, en he kin run same as er fox, all day long en mo', too. This prediction proves very accurate indeed. This particular rabbit crosses a branch twice and makes a brilliant dash along the whole line of hunters, while the shooting is like that on a skirmish line. The last man knocks him over.

Another rabbit, roused from his snug for min a hollow, goes up streams and into the woods, leaps a branch and goes into a hole in a tree. The hole is three or four feet above the ground, and looks hardly large enough for a ferret to enter. The dogs tree. Ben says "Let Old Blue say if he's in dar." Old Blue declares with a loud voice that something is in that hollow. A forked stick is passed up into the hollow. It brings hair. Then a split stick is introduced and Ben says, "I'll twiss him out en er minnit!" He adds: "He mighty nigh climb de tree." One is reminded of the rabbit Uncle Remus tells about so delightfully. That particular rabbit did climb a tree. Then Uncle Remus' little boy auditor protested that rabbits didn't climb trees. Uncle Remus remarked very grandly, "Well, honey, dis un did, kase he wuz 'bleeged ter climb." That settled the question.

The dogs make one *faux pas*. They eat a rabbit. For this they get a sound thrashing. Then there is a fight between three or four of them. Ben explains their misconduct by saying, "Dey ain't all mine, and so dey ain't 'zactly un ter each odder. Some dogs is mighty onfriendly anyways."

One rabbit, literally flushed by the writer in a thicket, makes a wild dash. The dogs are put on the trail and away they go, the writer after them. The Auditor decides that the rabbit will return to that spot, so he takes a place in an old roadway. A quarter of an hour he makes his report, or rather two reports, bang! bang! but these are not followed by the shout which announces victory. The fact is he missed clean. There are a lot of people back of him, ladies, children and darkies, spectators. The rabbit, scared half to death, plunges through these and into a branch and disappears as if swallowed by the earth. One darky says, "I don' see why dat gemmen didn't kill him. De rabbit's eyes look as big as engine headlights when he come down dat ole road." That rabbit fooled a score of people in a space of a few yards square, for it required another quarter of an hour to find him. Then a darky pulled him out of the edge of the branch, dripping wet.

"Dat shorely is er keen un," said Ben, as a rabbit over which hunters and dogs had literally walked, got up and made tracks the other way. "He jes' sot still en let de dawgs show what plum fools dey is." This rabbit takes to a thicket along a stream edge, and dodges in and out and is shot at several times. One darky finally said, "I seed him just' now en I swear he was er sittin' on his ha'nches er washin' his face wid his forepaws." This he regarded as an act most contemptuous both of the hunters and the dogs, but suddenly shouted, "Big-eyed rabbit, hoo! hoo!" as the shaggies stirred out the sneaking rascal of a rabbit. The softer note of the little beagles is heard as they peg away after the quarry. Ben allows that good as are the shaggies, "de beagle dogs is de most perseverin' kind dey is. Dey kin go anywhere er rabbit kin."

The Governor was in bad luck. Of the nine rabbits bagged in a couple of hours, he did not get one, nor did he get a shot. The Secretary of State and Auditor got the shots and did well.

Ben entertains the writer with some stories about "the rabbit and his ways." He says he has "seed um er dancin' and er playin' en mighty nigh er talkin' and er singin'." Some of FOREST AND STREAM'S readers have doubtless seen rabbits at play in the gloaming, and will understand what Ben meant; their queer gambols and their squeaky little voices being almost uncanny. Ben says they dance. Says he: "Den sashays at one another jes' like people at er dance. Dey bows en dey scrapes, den jumps up en cuts de pigeon whing. Yearly in de mornin' en erbout dusk is de times dey mos' in genrul cuts up dat erway. When dey doos dat erway dey shore is a plum sight. Er rabbit is er master han' ter stir erbout of er night. Owls gits atter him, foxes wants him, but he gits eround jus' de same. Endurin' er de day he sits eround mighty quiet. He's er waitin' ontwell night time. Rabbits eats fros'. Dat makes um fat. Dey's two kinds un um, de ole fiel' rabbit an' de swamp hyar. One's littler dan de udder. Bofe un um kin run like er streak." FRED A. OLDS.

Western Massachusetts Hunt.

(From The Springfield Republican. Nov 13.)

NEARLY a hundred hunters and from 30 to 40 hounds joined in the opening day's hunt of the Western Massachusetts Fox Club at Westfield yesterday. It was the usual success, although the number of brushes secured was not as large as at some of the former hunts. Sociability and good cheer prevailed, which is worth more than the killing of a large number of foxes. The exhilarating exercise with the ever-present expectancy of seeing a fox within gunshot, or the sound of the hounds as they jump a fox from his hiding place in some swamp or upon a mountainous ledge, is worth much to the real fox hunter. Men are known who have hunted sly Reynard for years without having secured a single brush, yet they enjoy the sport keenly and are never discouraged. It is the free open air life that appeals to them as much as the mere slaying of the fox. At least six pelts were secured, but the driving on the whole was disappointing.

The conditions were thought to be ideal. A rain had fallen in the night, and the ground was well dampened for successful trailing. Some of the veteran hunters, however, thought there was too much water, and said that the scent had been washed off the leaves and grass. They also shook their heads when they saw a southwest wind was blowing. Their predictions were not far amiss, for the trailing was not of the best. Two of the old hunters who predicted poor following were John Rood and Joseph Clark, of Sandisfield. Mr. Rood is 82 years old, and Mr. Clark 79. Both were in the hunt. The morning was productive of the best driving, and from about 7:30 till 9 there was considerable music from different packs of hounds that had caught a scent and started their quarry. Three dogs jumped a fox in the swamp near the lower reservoir brook, and for a half-hour there was the liveliest kind of a time. The pace was fast and furious, and the hounds were led a merry chase in small circles, until Mr. Fox finally tired of his capers and led the dogs over Mt. Tekoa and nearly to Fairfield, where he again began traveling in circles. There were no hunters in that section, and the fox failed to return. About 8 several dogs started another fox at the foot of the mountain and carried him along to the north until he fell a victim to the unerring aim of one of the hunters. There was a vast amount of ammunition wasted, much to the disgust of the genuine fox hunter. Many of the novices took to hunting rabbits and squirrels, and there was a continual bombardment, after the novelty of standing behind a stone wall or tree had worn off.

The start was made from the Park Square Hotel about 6 A. M., in 'busses and single carriages. Bugler Pettis made a tour of the town about 4:30 A. M., and awoke the sportsmen, as well as a majority of the other citizens within hearing. The threatening clouds cast a gloom over many of the hunters, but this was dispelled in a short time, when it was seen that the clouds were to shed no water, and the sun peeped through the rifts now and then. It was an enjoyable day for out-door sport, greatly in contrast to a year ago, when there was a miniature blizzard raging. The wind in the afternoon was not favorable to the chase, but there was not much to chase after the noon hour. The club made its headquarters at Albert Healey's house, on the road between Pochassic and Wyben, and the women of the latter village furnished an excellent luncheon to the half-famished sportsmen. The proceeds will be devoted to the little chapel at Wyben. The majority of the hunters, who had stationed themselves along Pitcher street, took lunch at Mr. Hayden's farmhouse. Most of the successful hunting was done along the base of the mountain. There were several good drives to the west of Pitcher street along Mount Tekoa, but little fun was derived from the hounds cut from the leash near old Grindstone Mountain. There was also less trailing to the east, toward the brickyard, Trainfield and Furrowtown, the foxes apparently being determined to stick close to the hills. It was thought that conditions were right for them to play the dogs out into the open pastures and fields, on account of the damp condition of the woods, but they did most of their running in the woods.

Many out-of-town men joined in the hunt, including about a score from Worcester and a half dozen from Hartford. Several women were also out to have a part in the hunt. F. M. Lamb, of Worcester, shot a fox in front of C. B. Daniel's dog, that had been running less than five minutes. The dog was all alone, and started his fox below the Pitcher Road, to the south of Ball Mountain. Mr. Daniels is also a Worcester man, and had the distinction of shooting a handsome dog fox in front of his own dog soon after Mr. Lamb killed his. It was a fine specimen. Both foxes were shot within less than an hour of each other, and both in front of Mr. Daniels's dog. This is an unusual record, and it is safe to say that Mr. Daniels was as proud of the achievement of his hound as he was of having secured a brush. Others who secured foxes were Harry N. Phelps, of Southwick; Dr. I. H. Pomeroy, of East Gloucester; Edward Williams, of Southwick, and Herbert Higgins, of Westfield, making a total of six in all, which is considered quite satisfactory, the conditions being considered. Dr. Pomeroy killed his fox late in the afternoon on the east side of Ball Mountain, and Mr. Williams bowled his over about 4 P. M., near Grindstone Mountain.

The hunters met in the early evening at the hotel to recount the experience of the day. At 6:45 a line was formed and the members and guests marched in a body to the Gem Opera House, with Officer John S. Breen performing escort duty. Hubbard catered for the banquet, about 175 being present. John T. Way, president of the club, called the gathering to order, after the cigars had been passed, and introduced E. W. Dickerman as toastmaster, who presented the speakers in a most pleasing manner. Congressman George P. Lawrence was one of the guests of honor, and received a warm welcome. The speaking was of a high order and was brightened by many witty stories. Running through the remarks of most of the speakers was a vein of seriousness, in which was emphasized the value of leading lives of honesty and sobriety, and of the need of giving freely of time and effort in solving great national problems. The manhood of President Roosevelt was commended by several of the speakers. Congressman Lawrence expressed himself as favoring rigid government supervision and control of great industries supplying the necessities of life. Mr. Green spoke of the democracy of the sportsman's life and paid a high tribute to Westfield, his old home. The other speakers were Judge J. J. Quinn, of Hartford, and A. B. F. Kinney, of Worcester; Rev. W. C. Gordon, S. H. Holmes, C. A. Brodeur and H. W. Ely.

Retrieving.

The best work on retrieving is "Fetch and Carry," the well-known treatise by B. Waters. In this work the amateur can find all the instruction necessary in training his dog to retrieve. Every educational step is carefully marked out for him, the methods of teaching every detail and correcting faults are fully explained; and thus the amatur need not be experimenting aimlessly for methods. Many collateral branches of training are also treated. "Fetch and Carry" has received the indorsement of nearly all the expert trainers of America. The chapters are The Amateur Trainer; The Importance of Retrieving; The Natural Retriever; The Educated Retriever; Implements and Commands; The Natural Method! The Force System; Seeking Dead and Wounded Birds; Incidental Training; Wildfowl Retrieving; The Irish Water Spaniel; The Chesapeake Bay Dog; Handling Retrievers; English Retrievers; Qualities of the Retriever; The Finder-Retriever; The Dog's Mentality. Cloth, price, $1.00. Forest and Stream Publishing Company.

There is a story current at Kuliang (Central China), says the Foochow Echo, about a tiger in that quarter giving trouble. It is said that a missionary and his wife had been worried by a tiger prowling nightly around their home. They determined to get rid of it. One night they tied a cow up in the backyard and a dog at the front of the house. Then they armed themselves with guns and kept watch. The tiger appeared, the missionary fired and killed the cow. The wife rushed to see what had happened, and in her absence the tiger ate the dog.

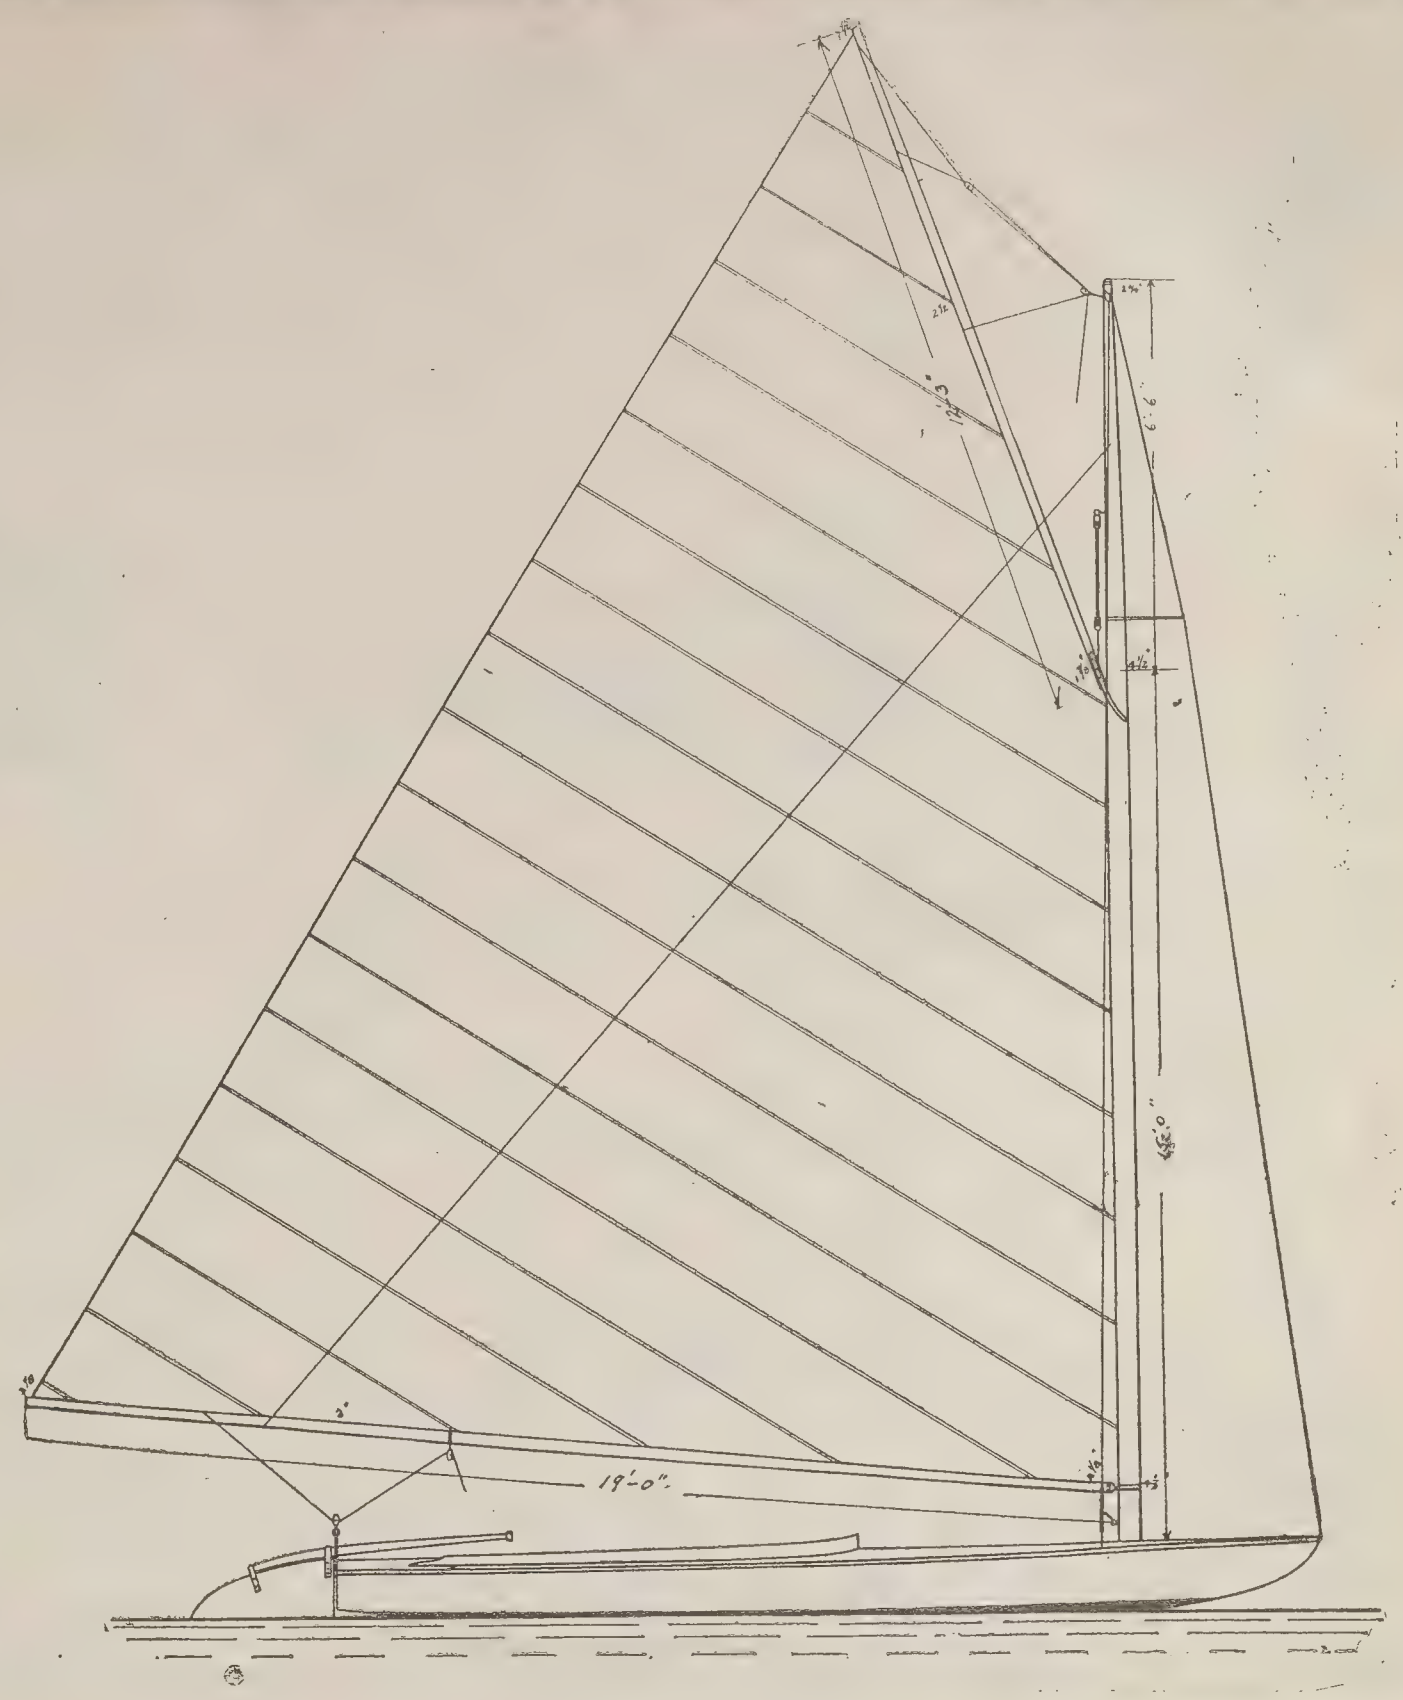
If warriors go to war by land, the turf shall receive the bodies of the slain. If warriors go to war by sea, the ocean shall receive the bodies of the slain. From time immemorial our gallant warriors have gone forth in swarms. Human life lasts but for fifty years; who would wish to purchase a few miserable years of life at the cost of dishonor? March and fire as long as breath remains, for our lives are at the disposal of the sovereign, our bodies are to be sacrificed to the glory of the country; let soldiers die with all their wounds in front. The souls of those who thus defy death shall be through the ages to come the guardian angels of tranquility. So, go forth, go forth, ye warriors; warriors, go forth!—Author, time and country unknown.

Yachting.

Barnegat Bay Sneak-Box.

The accompanying plans, which are given through the kindness of Mr. E. B. Schock, the designer, show the typical modernized sneak box, which is now raced on Barnegat Bay. The only restriction placed on these boats for racing is that they shall not exceed 17ft. over all length, and while boats of all descriptions and proportions are built and raced, it has been found that the most successful craft have been those with moderate dimensions of beam and sail area, similar to the plans given herewith The principal changes in this design from the original sneak-box, are the increase of freeboard, fuller bilge and more of a scow bow, to give her buoyancy forward and prevent diving when being driven off before the wind. The modern boats are handy and very fast on all points of sailing, and make an excellent type of inexpensive boat for afternoon sailing and racing in shallow waters. The dimensions are as follows:

Length—		
Over all	17ft.	oin.
Water line	13ft.	oin.
Overhang—		
Bow	3ft.	oin.
Stern	1ft.	oin.
Breadth—		
Extreme	6ft.	6in.
Waterline	5ft.	2in.
Freeboard—		
Forward	1ft.	3in.
Least	oft.	10in.
Draft—		
Extreme	1ft.	oin.
Hull alone	oft.	6in.



BARNEGAT SNEAK-BOX—SAIL PLAN.
Designed by E. B. Schock.

Boston Letter.

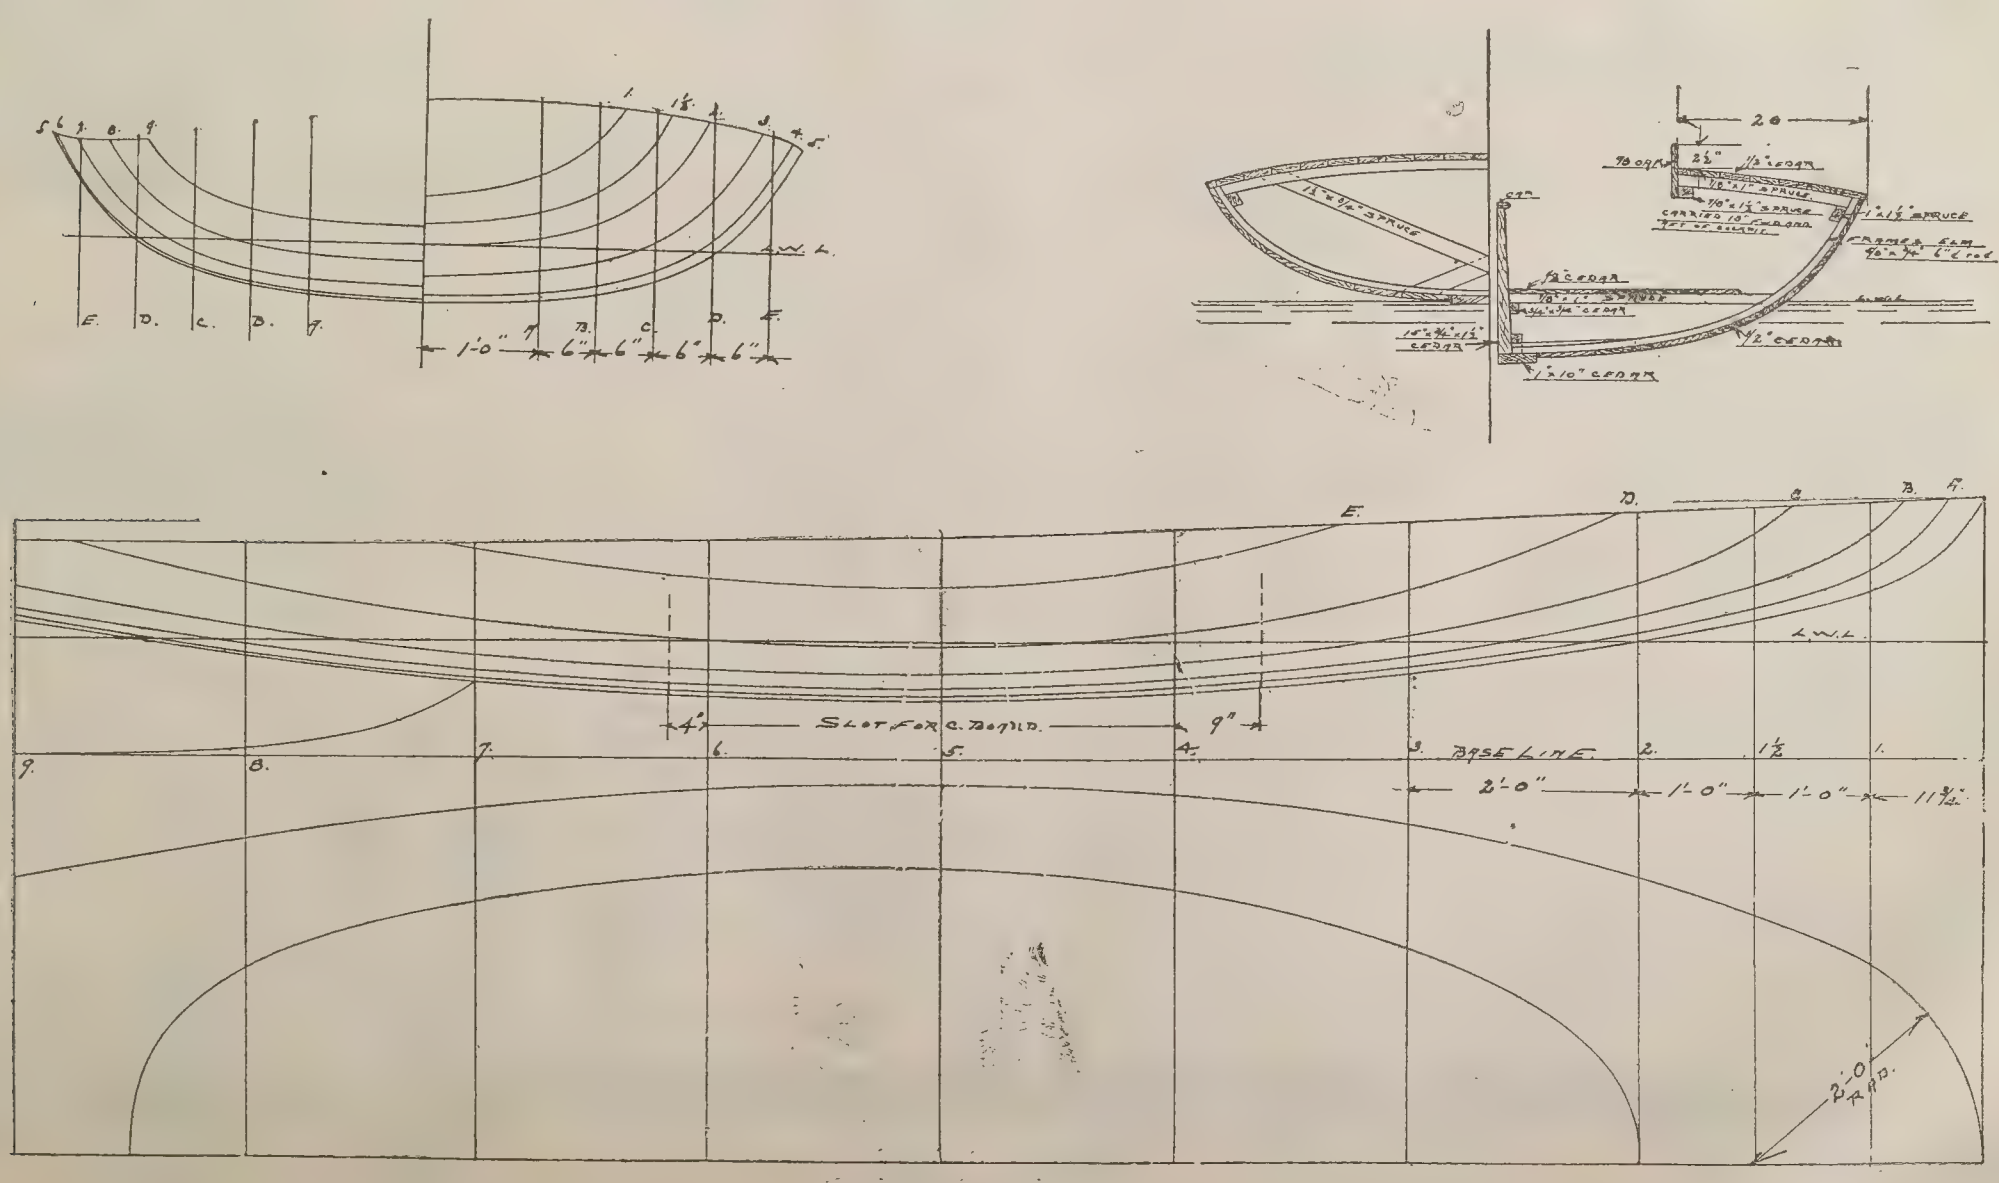
BOSTON, Nov. 17.—There was a hot time at the meeting of the Yacht Racing Association of Massachusetts last Thursday evening, especially when it is considered that nothing was done. Two measures of immense importance were acted upon, one the adoption of the proposed new 22ft. class, and the other the adoption of changes in the present rules governing the restricted 25ft. and 21ft. classes.

There was a little better attendance than at the two previous meetings. The adoption of the 22ft. class had spurred Mr. Sumner H. Foster, the organizer, to greater efforts, and he not only made a personal canvass among the delegates, but also came armed with proxies. When the vote was taken the result stood 12 for adoption and 5 against. Two of the delegates present did not vote when their clubs were called, and it was ruled that, under the by-laws, their silence was equal to votes in the negative. Had these votes not been counted as in the negative the class would have been admitted, a two-thirds vote being required, but with the addition of the two silent members to the no side the motion was lost, and the association refused to adopt the class. The discussion waxed warm, and Mr. Foster tried in several ways to get the vote reconsidered later, but all to no avail.

In spite of the fact that the association refused to adopt the 22ft. class, Mr. Foster has informed me that those who intended having boats built for it are going ahead, it being reasoned that if sufficient number of boats are built the clubs will give races for the class, anyway. The orders for the boats, it is said, will be placed this week. Burgess is said to have three orders for 22-footers and Lawley, three. Mr. S. C. Winsor, of the Duxbury Y. C., is much interested in the class, is anxious to communicate with those intending building at his Boston office, 19 T. Wharf.

The 22-footers having been disposed of by the Yacht Racing Association, the matter of changes in the rules came up. It was the intention to adopt rules on measurement, which would embody some of the features of the New York Y. C. rule, while still maintaining many of the principles of the present rule. In the call for the meeting, the manner of obtaining length was the same as the New York rule. It seemed, however, that there was considerable prejudice against the formula and the failure of its possible passage became apparent. So Mr. Louis M. Clark offered as a substitute, that the square root of the sail area should not exceed 145 per cent. of the cube root of the displacement. This was applied to 21-footers, and was lost upon vote. Thereupon Mr. Clark avowed that he did not intend to propose any more motions, and so a like proposition for the 25-footers was never offered. It was then voted that it be the sense of the meeting that no changes should be made in the existing rules governing 25-footers and 21-footers.

The result of that meeting puts the yachting prospect for next season in Massachusetts Bay in a very doubtful state. In spite of the vote not to change the rules, there are very few actual boat owners in the restricted classes who will not admit that changes in the rules are necessary for the health of the sport. For next season, then, the only one of the restricted classes which will hold together is the 18ft. knockabout class. There is a movement on foot now to get some of the owners of the 21-footers together and agree to race among themselves, but not against the objectionable boats. It is said that they can muster up ten boats, but there is likely to be



BARNEGAT SNEAK-BOX—LINES.

some question about this number. It is said that the older 25-footers will not race against the boats of extreme dimensions that are now being built. If this is so the interest in the 25ft. class will be very slight. Had the 22ft. class been adopted by the association, it is likely that several more boats than are now contemplated, would have been built. It is said, however, that the Corinthian Y. C. is likely to adopt the 22ft. class at its next meeting, as will also several other north shore clubs. It is also likely that the Duxbury Y. C. will adopt the class. If this is done the chances of a number of boats being built will be stronger.

Up to date the number of racing boats under construction is very small. It is not known that any restricted 21-footers are being built, while there are only two 25-footers under way. Burgess has finished the lines of one of the Seawanhaka Cup challengers, and she will be laid down this week. She will be built in Fenton's shop. The lines of the other Seawanhaka boat will be started as soon as possible. She will be built at Manchester in a special shed. Burgess has an order for a 30ft. water line cruising yawl for Mr. J. J. Feeley. A dozen yachtsmen have agreed to build for the Mattapoisett one-design class, for which Burgess turned out the lines.

At Lawley's west shop the 166ft. steam yacht for Mr. C A. Fletcher, of Providence, is about framed. Part of the plating is on and the bulkheads are in. In the east shop a 50ft. ketch for Mr. J. H. Cromwell, of New York, is partly planked. The keel for the 60ft. waterline schooner for Mr. C. H. Clark, of Philadelphia, is set up. A 34ft. yawl for Mr. F. H. Adriance is laid down. The cruising 30-footer for Mr. Alfred Douglas has been hauled out of the shop, and a sister boat is having her cabin finished up. Fred Lawley has orders for a 25-footer for Mr. Swift, of New Bedford, and a cruising 21-footer for Mr. L. H. Spalding, of Winchester. He has turned out the plans for an 18ft. class to be raced at Kennebunkport, Me. They will be built at that place. The design of the 50ft. schooner for Mr. John M. Richmond is being held off, awaiting the final action of the New York Y. C. on measurement rules.

JOHN B. KILLEEN.

A Racing Ice Yacht.

BY H. PERCY ASHLEY.

OLIVER BOOTH, of Poughkeepsie, who in 1790 built the first ice yacht, composed of a square box on three runners with a small sprit sail from his ducking boat, little realized that he was laying the foundation for thousands of racing ice craft all over the United States, Canada and Europe. Unless one has been constantly in touch with these speedy flyers of the frozen surface for the past twenty-five years, and noted their gradual improvement from year to year from the crude side rail affair to the hollow-back bone racing machine of this winter, the improvements seem incredible. And why? For the reason that past experience coupled with scientific designing, has placed these flyers under control, and the danger attached to this sport years ago when the ice yachts were built by the rule of thumb, has passed, the modern, up-to-date racing ice yacht is obedient to her tiller under any circumstances, and the windward runner does not raise from the ice except in a half a gale, and then reefing is required. The most prominent and practical improvements of late are hollow spars, hollow trussed back bone, steering box aft of the clew of mainsail, reduced jibs and sails, hoisting with pliable steel running rigging. Many of these improvements are due to Com. H. C. Higginson, of the Orange Lake Ice Y. C., who constructs, under his personal supervision, and sails new racing ice yachts from year to year. The racing ice yacht whose plans appear in FOREST AND STREAM, is of the third class, according to the world's classification if ice yachts, which is as follows: "Ice yachts shall be divided by sail area into five classes, as follows: First class, measuring 600 sq. ft. of sail area and over; second class, measuring 450 and under 600 sq. ft.; third class, measuring 300 sq. ft. and under 450; fourth class, measuring 225 sq. ft. and under 300; fifth class, measuring less than 225 sq. ft." The style of rig or shape of hull and dimensions are at the designer's option. In the accompanying sail plan that calls for the sails fully stretched, it will be noted that the ice yacht carries 442 86-100 sq. ft., making her a third class boat, and just 8 and 14-100 sq. ft. less than an ice yacht of the second class. Hence the craft can go up a class and sail in it as well as her own, and have a fair show with the second class boats, and for all around racing in class or mixed class, a craft of these dimensions is the most practicable. The international rule, which originated with the Orange Lake Ice Y. C., in a mixed class, is as follows: "Allow one second for every square foot of canvas carried over the smaller boat, provided the course is ten miles, and the time limit of the race is one hour. If the race is sailed in fifty minutes, 50-60 of a second per square foot, and so on in accordance with the time of the race. In other words, a large ice yacht does not give the smaller boat so much time if the race is sailed in a half hour as she does if the race is sailed in one hour. In a five-mile course, one-half second per square foot can be used. If the race is sailed in thirty minutes, allow 15-60 of a second per square foot, and if sailed in twenty-four minutes, 12-60, and in accordance. The general time limit for five miles is 30 minutes. In this racing ice yacht the general dimensions are: Back bone over all, 40ft. 6in.; track of fore runners, 22ft. 1in.; from nose to center of mast, 10ft. 6in.; from center of mast to center of runner plank, 4ft. 9in.; cockpit, 8ft. by 4ft.; sail area, mainsail, 376 86-100 sq. ft.; jib, 66 sq. ft.; total, 442 86-100 sq ft.

In building, the first step is to select the wood for back bone and runner plank. The very best wood is basswood, well seasoned and free from knots and checks. The merits of the other woods are in their order named: White wood, butternut, white cedar, pine. In carrying out these specifications, it should be clearly understood that the materials and workmanship of wood, iron, bronze, sails and rigging should be of the very highest order, and the plans accurately followed.

Back Bone or Center Timber.—Select two first class planks of basswood; when fully dressed should measure 41ft. by 12in. by 1¼in.; these form the sides or shell of the back bone (see Plate 2, Fig. 38). Take one plank and measure off 40ft. 6in. from the end used for the nose place, a mark 4in. from the lower side upward. At the mast it measures 11in., at nose of cockpit 7½in., at extreme stern 5¼ in; the lower side is perfectly straight. Now take a long batten and sweep out the curve, as shown in Plate 1. Mark your second plank from the first one after being dressed to batten mark. When the back bone is finished, including the oak caps on bottom and top, it should measure at nose 5in.; at mast, 12in., and at heel 5¾in. Now that you have your shells or sides of the back bone dressed smooth, lay one side on a leveled surface, and take your strips of soft, seasoned white pine, free from checks or knots. The dimensions of these pieces which form the truss for the hollow back bone, are 2in. by 2in. The first two pieces of the truss are placed under the mast at an angle of 45 degrees (see plate No. 2, Fig. 33). The contact surface is given a liberal coat of fish glue, and temporarily tacked in place with two screws from the inside. Between these two is fitted a triangular piece of pine 2in. thick, to sustain the downward thrust of the mast (Plate 2, Fig. 37). Now reverse the plank and screw fast, making the heads of the screws flush with the surface of the plank. At the next truss is inserted a piece of pine at the lower side, measuring 2in. by 3in., to sustain the upward thrust of the bobstay spreader. (Plate 2, Figs. 32 and 37.) The same directions are followed in forward bobstay spreaders. (Plate 2, Fig. 32.) Insert a 2in. piece at nose 2ft. long. (Plate 2, Fig. 31.) The formation of the nose is shown in Plate 4; the horn part of the same is capped with a 3in. diameter by 2½in. and ⅛in. thick iron band to receive the runner plank forestay. Aft of this is an iron band 3¾in. deep (on top and bottom) of ⅛in. iron set flush with the wood and pierced with a U iron ½in. in diameter, to receive turnbuckle for jibstay. (See Plate 4.) The iron work is fitted after the back bone is ready for varnishing. Secure the trusses aft from the mast until the runner plank is met, and fit a strip 2 by 3in. parallel with back bone to give holding wood for the three ½in. lag bolts that secure the heel of bobstay. (Plate 2, Fig. 34.) Truss aft, as shown in Plate 2, until the nose of cockpit is reached, and insert a piece of pine 2in. thick and 2ft. long; also one of the same thickness of oak at heel of back bone. (Plate 2, Figs. 35 and 36.) These pieces of solid wood strengthen ends of cockpit rail and rudder post. Now that your truss is finished, glue and screw on the remaining shell and cap, the same with strips of oak 4¼in. by ½in. on top and bottom. The oak is secured by glue and screws 6in. apart on each side. (Plate 2, Figs. 38 and 39.)

On each side of rudder post is fitted an iron band, 1¼in. broad and ⅛in. thick. The forward band is in contact with the heel of back bone on its inner surface, while the after one is set flush. (Plate 3, Fig. 4.) It will be noted by reference to Plate 2, Fig. 35, that the under ½in. oak cap extends only to the nose of the cockpit, as the flooring of the cockpit is in contact with the side planks of back bone.

Runner Plank.—A plank 23ft. long by 16in. broad and 5½in. thick, is required when dressed. See that the heart of the timber is on the upper side. Dress down from the upper side in a gradual curve to the ends, which should measure in depth 2¾in. Now take down the width of the plank at ends to 14in., and cut away wood on the under side at middle, the shape of draft of saddle in Plate 4, gradually bringing it to nothing as it meets the runner chocks. When the plank is finished the dimensions should be, center 16in. by 5½in., ends 2¾in. by 14in., length over all 23ft. The hole for shroud pin bolt is set 1½in. forward of the center of the plank. (Plate 2, Fig. 18.) The distance between these holes is 12ft. (Plate 2, Figs. 18 and 19.)

Runners and Steering Gear.—Turn to Plate 4, No. 7. The forerunners are made of white oak. The forerunners measure 5ft. 5in. from nose to heel, and are 2½in. wide by 5½in. deep. (Plate 3, No. 3.) They are pierced with a ¾in. bolt, on which they ride. (Plate 3, No. 2.) The shoe is of soft cast iron, 2½in. deep, and has a cutting surface of 45 degrees. This is securely held in place five square-shouldered screw-headed bolts ⅝in. diameter. In finishing up the fore and aft cutting surface of the shoe with a small file, see that at the riding bolt the bottom of the shoe takes a gradual downward curve from the nose to the riding bolt; the greatest depth is at the bolt, and is 3-32in. The upward curve aft of the riding bolt is the same. In Plate 3 the ice line is shown by dots. The wood for rudder runner is 3ft. 1in. over all, 3¼in. deep, and 2in wide. It has two plates set flush, of ⅛in. thick iron, to prevent chafing of jaws of rudder post. The rudder runner shoes are also of soft cast iron with a pitch at bottom of 45 degrees, with a slight fore and aft upward curve of 2-32in. at the ice contact edge. Full working details of the steering apparatus are given in Plate 3, Nos. 4 and 5. The rudder post is 11½in. from top of the nut to flange that sets on boss at lower side of back bone. From bottom of jaws to top of nut is 17in.; diameter of rudder post 1½in.; diameter of jaws, 3in. The rudder post works in two brass bosses on upper and lower side of back bone. They are secured to the wood by four screws for each, which are set flush with the face of the boss. The tiller fits on the square head of the runner post and is 3ft. 4in. over all. Material for steering gear, mild steel, engine turned.

Runner Chocks.—The runner chocks are made of white oak and measure 24in. over all by 4¼in. deep and 2in. wide. They are sunk ⅛in. in the plank, and each chock is pierced with four lag screws of ½in. diameter, which secure them to the ends of the runner plank. On the inside chocks are mortised two brackets of oak for each chock. Three brackets are sunk ⅛in. in the plank, being glued and lag bolted as well as the chocks. At right angles to chocks in their center, they are pierced with riding bolts of ¾in. diameter. (Plate 3, No. 2.) For drawings of chocks and brackets, see Plate 3, Nos. 1 and 2, also Plate 2, No. 20.

Cockpit or Steering Box.—Is composed of two steam bent rails, one for each side, of oak, 4½in. by 1½in. On the inner lower side is cut a square shoulder (before bending), ½in. deep by ¾in. broad. (Plate 2, No. 30.) The cockpit rails at their extreme are screwed to the sides of the back bone, and when in place the whole cockpit from outside measurements should be 8ft. by 4ft. The flooring is 2½in. wide by ½in. tongued and grooved oak, and is screwed to the bottom of the cockpit rail and back bone. (See Plate 2, Fig. 30, and letters A, B and D, E.) On the back bone at center of cockpit is placed a hickory hand rail which measures 4ft. over all by 3in. high. See stern of back bone, Plate 1.

Spars.—The spars are all hollow, and are of the Fraser make, of the following dimensions: Mast, over all, 25ft.; head, 4½in. in diameter; heel, 4¼in.; center, 5½in. At head and heel it is capped with two bands, set flush, the upper one being 2¼in. deep and 3-16in. thick; lower or heel band is 1½in. deep and 3-16in. thick; the material is brass. Below the masthead cap is a ½in. diameter eye bolt to which is shackled the peak halyard block, and above this is sunk to the depth of ¼in. two masthead chocks of oak. Below the peak halyard block bolt is cut a slot fore and aft, to receive two solid brass sheaves to receive a 5-16in. wire rope. Below this slot is sunk two more oak chocks, on which rest the spreader stays. (See masthead, Plate 4.) By referring to Plate 2, No. 1, you will see that the mast contains three solid parts, one at each end, and the third at the spreader. Just 6in. below spreader, cut slot fore and aft, and insert two solid brass sheaves to receive ½in. diameter running steel rigging for throat halyard. (See Plate 4, mast at spreader.) The boom is 25ft. 11in. long, 4¼in. diameter at center, 3in. at ends. The outboard end is equipped with a brass band and bronze staple for outhauling. The inboard end is attached to an aluminum bronze gooseneck, which passes around the mast, as shown in Plate 4. The gaff measures 13ft. 6in. by 3½in. at center and 2½in. at ends, and has a band and out haul staple at the outboard end, and bent jaws, tumbler and hoisting block at the inboard extremity. The jib boom is 9ft. 2in. over all, 2¼in. at center, 2in. circumference at ends. There are nine mast hoops, whose edges are rounded and whose inside diameter is 6¼in. The top hoop has a piece of pork rind sewed around the forward side to insure easy slipping on mast.

Rigging.

The main shrouds are of ⅜ diameter, plough steel (galvanized), of 7 wires to a strand, with breaking strain of 7 tons. Jib stay is the same as main shrouds—spreader stays of 9-32in. diameter plough steel (galvanized), with breaking strain of 3½ tons. The runner plank guys both forward and aft are of (galvanized) 9-32in. diameter plough steel, breaking at 3½ tons. The jib halyard is 5-16in. steel running rigging with a breaking strain of 2.2 tons, throat halyard ½in. diameter, steel running rigging, breaking strain 5.3 tons. Peak halyard, 7-16in. diameter, breaking at 3.3 tons. Lower bridle steel running rigging 5-16in. diameter, breaks at 2.2 tons, upper bridle ⅜in. diameter, breaking strain 2.7 tons. The blocks, cleats, etc., are of Durkee's make, and are as follows:

Durkee's bronze blocks, size 2 (for ½ diameter, 4 strand manila bolt rope, extra fine 12-thread). Style C, 2 double, 3 single, with becket, 1 single without becket. These are for the halyard jigs.

The peak halyard block is Durkee's bronze block No. 1, style C, with becket, remove its sheave and replace with the largest diameter sheave this becket block will take. As it remedies the great strain of wire peak halyard in passing through the peak halyard block, this block must be equipped with an extra strong Tobin bronze shackle and substantial pin bolt. The shroud turn buckles are of ¾in. diameter thread, with forged Tobin bronze ends and Manganese bronze body, breaking strain 8 tons; one end is an eye, the other a fork. Jib turn buckle same as shrouds, excepting it has an eye at each end with brass pipe washer and nut to keep eye bolt of jib boom in place (see plate 4), 4 half-inch turn buckles same style as shroud buckles, breaking strain 4 tons. These are for runner plank stays, 1 ½in. turn buckle, ½in. eye at each end, one eye to receive bronze shacle size No. 1.

Iron Work (Plate 4).

The mast head spreader is of mild steel, with hollow arms extending 11in., ¾in. at butt, tapering to ½in. The collar for spreader is 2½ by 3-16in. of steel. The bob stay is ⅝in. Scotch iron, lightened by an open turn buckle, with jam nuts at each end on the bobstay side, two bobstay spreaders set in square plates ¼in. thick, set flush with the lower side of backbone; the spreaders should be arranged to be removed from the plates when the boat is taken apart, length of spreaders 5in. A similar plate is made to receive the three lag screws of ½in. diameter at heel of bobstay. The mast step is 7in. long by 4¼in. wide and ½in. thick. In its center is a raised tennant, and a mortise is cut in the heel of mast to receive the same. The mast step is secured to the backbone by 4 screws sunk flush. Material of mast step, cast-iron. A ½in. iron rod, ending in an eye, is joined at forward end eye above mast step 2½in. Halyard brackets, of which there are 3 pairs (Plate 2, No. 26). Plate 4 shows shape and how they are placed on backbone. They are made of malleable iron and are 8in. over all. The halyard chucks are of cast brass, 3½in. long (Plate 4). The jig irons are of ½in. malleable iron, with eyes at upper end and a flat surface at bottom, held in place by ¼in. lag screws. The saddle is of malleable iron, 2in. by ¼in., and fits snugly over the backbone. The arms of the same are ¾in. diameter, iron ending in a nut capped by a flange washer. The toggle iron is of ¼in. iron with arms at ends of 1in., near circle 1½in., circle 3in. in diameter. It is held in place by a shroud bolt ⅞in. diameter, of mild steel, the upper end is fitted to receive jaws of turn buckles for main shrouds, the lower end has a thread and nut.

I wish to impress thoroughly that you cannot have a suit of sails set too flat. Have the sails made flat, no matter what your sailmaker advises, for they have no practical experience in handling these flyers of the ice. If your sail is the least bit baggy it backs with you as you fly over the ice at a mile a minute, and to a great extent retards your headway. Give the hull one coat of filler, rub down and cover with two coats of best spar varnish. Iron work to receive two coats of silver bronze. Blocks, turnbuckles, etc., to be buffed and then coated with lacquer, then they will stay bright all winter. The total weight of this boat should be 1,377 pounds, divided as follows: Backbone, 450; runner plank, 375; mast, 54; boom, 42; gaff, 14; jib boom, 7; runners, rudder post and tiller, 210; sails, 75; rigging of all kinds, 150 pounds. The above figures are for hollow construction. I would advise that runners, rudder post and tiller be made by an experienced man who has made a specialty of racing ice yachts.

Key to Plate II.

1. Hollow mast.
2. Hollow boom.
3. Hollow gaff.
4. Hollow jibboom.
5. Masthead band.
6. Slot for jib halyard.
7. Masthead spreader.
8. Slot for throat halyard.
9. Mast heel band.
10. Eye-bolts to tighten up spreader shrouds.
11. Saddle and bolts.
12. Shroud turnbuckles.
13. Runner chock bracket.
14. Fore runner.
15. Nose and cap.
16. Jib traveler.
17. Mast step.
18. Turnbuckles for guys.
19. Toggle iron.
20. Runner chock brackets.
21. Saddle for back bone.
22. Upper side of runner and chock.
23. Cleat for peak halyard.
24. Cleat for throat halyard.
25. Cleat for jib halyard.
26. Irons to coil halyards on.
27. Bolt for runner plank back stays.
28. Strip of oak to reinforce back stays.
29. Rudder post.
30. Enlarged draft, showing the method of joining the flooring and coaming.
31. Block in nose of hollow back bone.
32. Strip to reinforce bobstay spreader.
33. Strip to reinforce bobstay and block for mast.
34. Strip to reinforce heel of bobstay.
35. Two-foot block to reinforce nose of cockpit.
36. Two-foot block to reinforce rudder post and heel of cockpit.
37. Enlarged draft of bridge constructed hollow backbone.
38. Enlarged draft, mid-section of same.
39. Enlarged draft of outside of same.

A—Top of cockpit.
B—Cockpit coaming.
C—Backbone.
D—Mid-section of cockpit coaming.
E—Cockpit flooring.

English Letter.

So far the news of a new Fife 65-footer does not appear to have attracted any rivals, though this class ought to be an excellent one, according to the traditions of our racing. Indeed, there is little to show any likelihood of next year being any better than this in open racing, and so a strong feeling exists that the handicap classes should be placed on a more satisfactory footing. A suggestion has been urged for years by one of the papers that the Y. R. A. should appoint an official handicapper, and the Field some time ago pointed out an excellent way of carrying this out, viz., for a handicap committee to allot the boats in each class an imaginary rating, corresponding to the time allowance that in its opinion each boat should have. That is to say, a slow boat of perhaps 75 actual rating might sail as only 60 in all handicap races. This would save the clubs from no end of trouble in framing handicaps, and would undoubtedly please the owners better than the present happy-go-lucky system. An owner who thought his boat rated too high, could apply for a reconsideration of her case on payment of a small fee, and the committee would at any time readjust ratings that they saw to be wrong. On your side of the Atlantic yachting appears to suffer from the want of one central controlling association. Here we have such, or the makings of such, an association, but it is lamentably lacking in energy. Whether this suggestion will be taken up is doubtful, though it is eminently sensible, and even if it is carried into effect, it will have been accomplished only after a most persistent advocacy.

Talking of Associations, an attempt is being made to form one for motor launch racing, and I think it will have succeeded before this reaches you. The idea at present is to promote racing among yachts' launches of various sizes, with a bar on lack of beam and a compulsory minimum scantling. Beside this, an open or purely "machine" class is probable, in which the class limit of length will alone be considered. This may not fill for some time, but as our French neighbors adopt this form of racing to the exclusion of all others, we must have some means of licking them. Time allowances in the other, or ordinary, classes will take into consideration length and horse power, the latter being derived from cylinder measurements and number of revolutions, without the slightest reference to the makers' statements as to power. No doubt we shall have competitors from your side at times, and certainly from France.

A nasty petrol explosion occurred last month on a little 12-ton auxiliary cruiser in Southampton water. The paid hand (alone) had come on board about 10 o'clock at night, and was going to turn in. He struck a match and an explosion followed. He was seriously burned, but was able to get ashore in the dinghy, and is now recovering. Now, this was a somewhat peculiar case, for afterward no leak of petrol could be detected. I hear that the real cause lay in the fact that on the previous day when the boat was out, continued and prolonged attempts were made to start the engine, and the poor thing would not start because, as was finally discovered, the batteries were exhausted and supplied no spark! The continued efforts to start flooded the engine with petrol, and this in some way found its way into the bottom of the boat, where the gas hung until mixed up by the draught from the scuttle, when it was exploded by the lit match.

The most important turbine yacht yet built will be launched early next year. She is between thirteen and fourteen hundred tons, and is for Mr. A. L. Barber, of New York. Messrs. Cox & King are the designers of this vessel, and they also designed Col. McCalmont's small turbine yacht, which was the first yacht with this type of machinery ever built.

There is, of course, no news of the new challenger for the Cup, and any that may appear in your enterprising daily contemporaries may be taken as purely fanciful. Sir Thomas, I read, has expressed his disapprobation of racing machines for Cup-lifting purposes. That seems to me a most entertaining phase of thought in a man who, perhaps, has gone further than any other in producing such objectionable boats. The letters that passed last summer between him and the N. Y. Y. C. on the subject of the new rule have created a good impression here. It is felt that the club acted very honorably in the non-application of the rule to the next races, in view of the fact that it might have discounted the value of the first two Shamrocks as trial boats for the new challenger. Our daily papers are so hard put to it to supply the demand (?) of the public for information on Cup matters, that one actually issued a broadside this week completely filled with the news that a new defender would be built!

His Majesty's new yacht, Victoria and Albert, is to be fitted with telescopic masts. These will be much longer when at their full height than the present solid spars, and they will add very much to the vessel's appearance. The King intends to cruise in her in the Mediterranean in the early part of next year. Not a whisper further has been heard of the rumored new first-class cutter said to be building for His Majesty, and there is probably no truth in the report.

E. H. HAMILTON.

The Thomas W. Lawson.

MANY yachtsmen throughout the country have been interested in the building of the huge seven-masted steel schooner which was designed by Mr. B. B. Crowninshield, and they will now be pleased to learn of her performance on her maiden voyage, the following account of which is taken from the Boston Herald:

The big seven-masted schooner Thomas W. Lawson is back in Boston Harbor with 7,345 tons of bituminous coal on board for the Metropolitan Coal Company, and her commander, Capt. Crowley, says she is the finest vessel he was ever on board. The cargo she has is one of the largest a schooner has ever brought to this port, but it is not nearly large enough to fill the Lawson's holds.

"She can easily carry 8,000 tons," said Capt. Crowley yesterday afternoon. "With 7,345 tons on board, she is only drawing 26½ feet of water. We did not bring a full cargo because we could not get it."

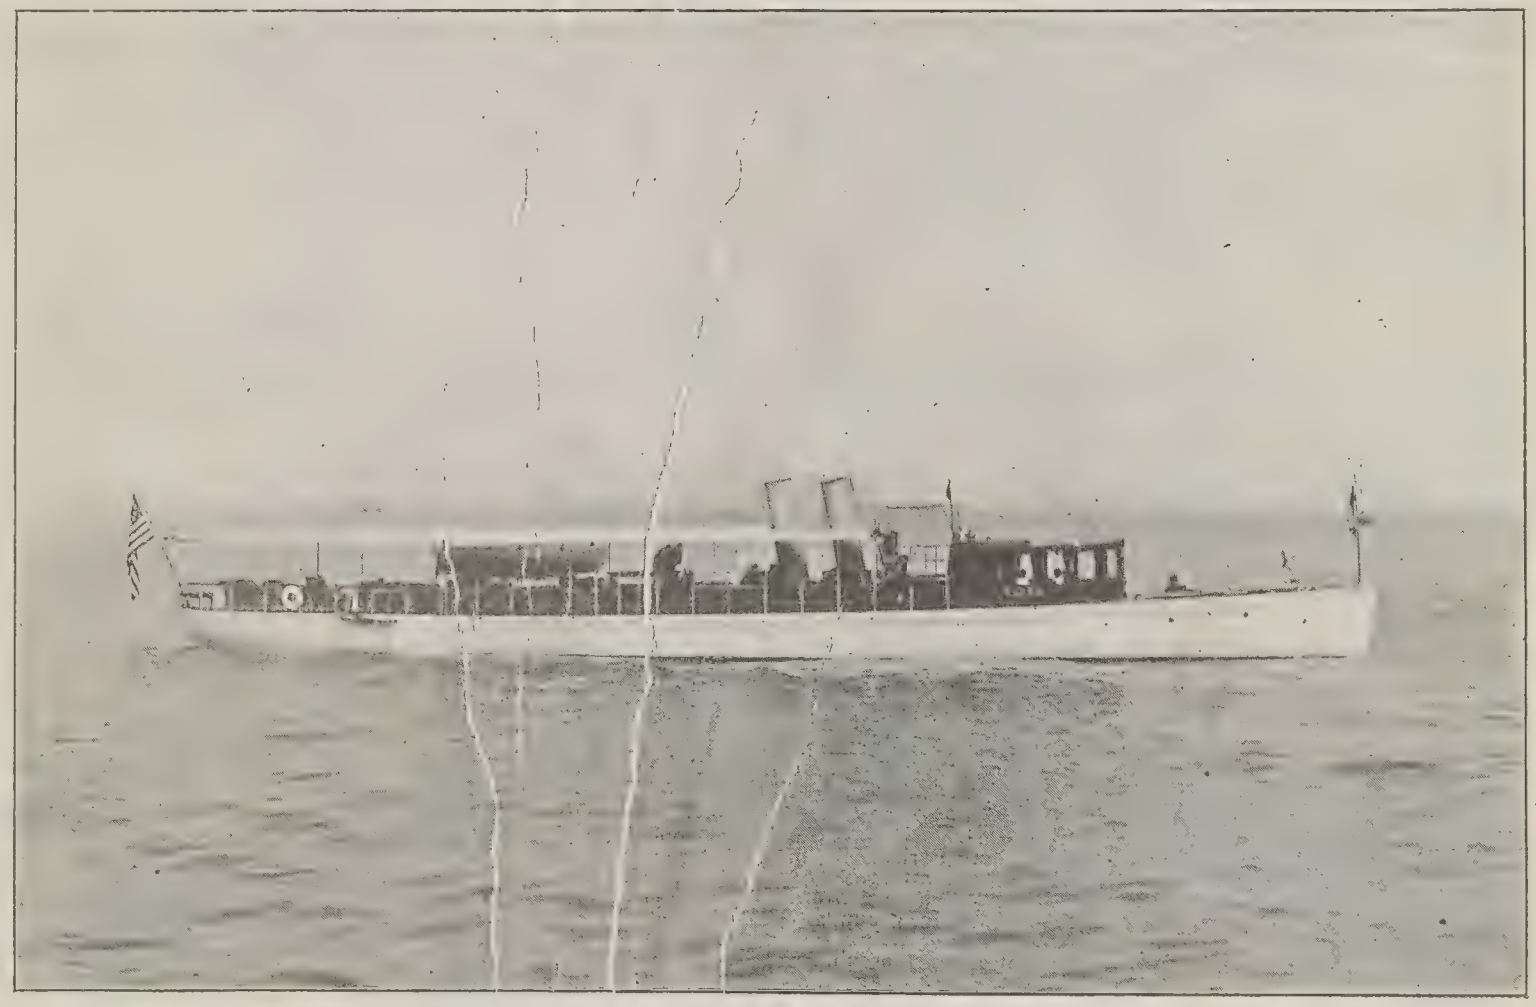
The Lawson was towed into the harbor yesterday. At 5 o'clock Thursday night she anchored off Boston Light, after a passage from Philadelphia that thoroughly tested her seagoing qualities. From the time she left the Delaware Saturday until her anchor was droped off Boston Light, she met a continuous success of gales, sharp breezes and heavy seas, which would have washed an ordinary vessel fore and aft.

But even a drop of water did not reach the Lawson's deck, Capt. Crowley says, and she rode in the heavy seas like a duck.

"She is away ahead of any wooden vessel I have ever been in," said Capt. Crowley, "and I have sailed in seven sizes of them. She is very easy to handle, and I am thoroughly satisfied that she is more than we expected she would be."

She is not of clipper speed, but she can reel off 13 or 14 knots, and stay at sea when smaller craft would have to seek shelter. Considering everything, she made good time from Philadelphia. Tuesday morning she was at Vineyard Haven, where she anchored because of a gale. Wednesday morning she left the shoals, and, although there was a lively gale in Massachusetts Bay Thursday, she was able to carry her canvas until she anchored off the Light at 5 o'clock.

The Lawson docked at the Liverpool wharf, near the South Terminal Station.



VIXEN—HIGH-SPEED STEAM YACHT.
Designed and built by the Gas Engine and Power Co., 1902. Photo by James Burton.

Vixen.

The high-speed steam yacht Vixen, designed and built by the Gas Engine and Power Company and Chas. L. Seabury Company, is owned by Mr. John D. Archbold, of the New York Y. C. Vixen is fitted with twin screws and has two triple expansion engines with three cylinders, each 7in., 14½in. and 17½in. by 10in. stroke. Steam is supplied by Seabury patent water tube boilers. Her dimensions are—length over all, 100ft.; waterline, 76ft.; breadth, 12ft.; draft, 4ft.

YACHTING NEWS NOTES.

The steam yacht Aztec, owned by Mr. A. C. Burrage, of Boston, is now out of commission, undergoing preparations for a long winter cruise.

The auxiliary schooner Oonas, of Cary Smith design, has recently been sold through the agency of A. J. McIntosh to Mr. Albert V. de Goicoura, of New York city by Mr. William H. Alley, of Chicago, her former owner. Oonas was built last year by Poillion at South Brooklyn, and is 68ft. waterline, 95ft. over all, 20ft. beam and 10ft. draft.

Sloop Fanny, from Newberne, N. C., for New York, was caught in a northeasterly gale off the Delaware Breakwater and driven ashore at Point of Capes. She is owned by Mr. Thomas Fisk, of New York.

The Marconi Wireless Telegraph Company has secured a site for a station at Eaton's Neck, Long Island, the first of a series to be built along the Sound for the convenience of yachtsmen who, while cruising in these waters, can keep in communication with New York at all times.

At Morris Heights the Gas Engine and Power Company and Chas. L. Seabury & Co., are very busy with new work, and have several large steam yachts now under course of construction. The largest is for Mr. Edward H. Blake, of Bangor, Me., and will be called Aria. She is 165ft. in length, of steel construction, and thoroughly up to date in every particular. Frames are being set up for a composite steamer 115ft. long for Mr. S. H. Vandegrift, of Pittsburg, Pa., who will use the boat on the St. Lawrence. In order to get her through the canals, her bow and stern are being built so that they may be detached. Plans are being prepared for a high-speed launch similar to Vixen, built last year for Mr. John D. Archbold. The new boat will be 110ft. over all, 104ft. waterline, 14ft. beam, 4ft. 9in. draft. She will have twin screws with triple expansion engines and Seabury water-tube boilers. She is to have a speed of twenty miles and will be owned by Mr. Parker Bremer, of Boston. A flush-decked, schooner-rigged steam yacht, 103ft. over all, is well under way for Mr. Henry S. F. Davis, of New York. An auxiliary cruising yawl 70ft. over all is being built for Mr. J. H. Smedley, of Detroit, who will cruise in her on the lakes.

The auxiliary yacht Enterprise, owned by Mr. Frank L. Perin, N. Y. Y. C., is fitting for a Southern cruise at Baltimore, Md. Changes are being made in her spars and rigging, and when completed she will have about the same rig as Aloha, flagship of the Seawanhaka.

Designer Starling Burgess has a long list of orders for new boats, and is very busy getting out new designs.

From present indications the ice yachting season at Detroit will eclipse that of any previous winter. More boats will be added to the Lake St. Clair fleet than in any preceding single season, and more interesting competitions in the racing events hereabouts should be the result. The Grosse Pointe Ice Y. C. has already made arrangements for its season, and announces a club race every Saturday, a sweepstakes every Sunday, and a ladies' day every Thursday. Grosse Pointe's course has been greatly improved since a year ago, and of course for racing, two and a half miles triangular, is now possible. There have been removed from the lake about six hundred rocks that formerly protruded through the surface of the ice. The international race, which is the Grosse Pointe classic, will be decided in January, instead of at the usual date, some six weeks later. This is expected to give assurance of better ice. Canadian and Eastern owners are being corresponded with, for the purpose of making the race a more open event. Jacob Obernesser, of Toronto, has already promised to bring the Canada here.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Rifle Range and Gallery.

The riflemen of Newark, N. J., have taken steps toward arranging a series of home and home matches between the different rifle clubs, which in numbers are quite enough to form a good league. willingness to participate. This week, some definite action is con- Several clubs have signified their approval of the matter and their templated at thet meeting of Our Own Rifle Club, 136 Springfield avenue.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Nov. 22.—Singac, N. J.—Open live-bird shoot of the Jackson Park Gun Club.

Nov. 27.—Ossining, N. Y.—Inter-county seven-man team shoot and 100 target event for cup emblematic of championship of Westchester county.

Chicago, Ill.—Garfield Gun Club's target shoot, every Saturday afternoon. Grounds, West Monroe street and Fifty-second avenue. Dr. J. W. Meek, Sec'y.

Fourth Tuesday of each month, Hell Gate Gun Club's shoot at Outwater's Riverside grounds, Paterson Plank Road, Carlstadt, N. J.

Second Friday of each month (January and July excepted), shoot of Hell Gate Annex, at Dexter Park, Brooklyn.

Saturdays, Brooklyn Gun Club's shoot, Enfield street, near Liberty avenue, Brooklyn. Visitors welcome.

Saturdays, Newark, N. J., South Side Gun Club's shoots, South Broad street, near Lehigh Valley coal depot.

Saturdays, Outwater's grounds, Carlstadt, N. J., live bird handicaps.

Interstate Park, Queens, L. I.—Two miles beyond Jamaica, on L. I. R. R. Trains direct to grounds. Completely appointed shooting grounds always ready for matches, club shoots or private practice.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM *goes to press on* TUESDAY OF EACH WEEK.

The multitude of friends will be profoundly sympathetic on learning that Mr. Harold Money met with a grievous accident last week on Tuesday while hunting ruffed grouse in northern Michigan. His companion, who was well to the right in the rear of Mr. Money, shot at a grouse flying high, but in the general direction in which Mr. Money was traveling, and a pellet, unaccountably deflected, struck Mr. Money on the inner corner of the left eye. The sight is impaired somewhat, but probably only temporarily from shock to the nerves. Mr. Money arrived in New York on Saturday last, and is having the injury treated by an oculist.

Mr. Herbert Taylor, recently of St. Louis, Mo., has entered a broader field of business activity and responsibility in the business with which he has been so eminently and so successfully identified for many years past. He has accepted a position in the Sales Department of the Hazard and Dupont powder companies in the home office, in Wilmington, Del. Mr. Taylor's ability as an agent in past years, and his profound knowledge of everything pertaining to the manufacture, sale and use of powder, insure his success in his new and higher position.

There will be an all-day target shoot at Interstate Park, L. I., on New Year's Day. Mr. John S. Wright has announced a target shoot for Christmas Day at Interstate Park, so that an active winter season of trapshooting competition on those historic grounds is assured by the auspicious commencement. Immediately after Thanksgiving Day at Interstate Park all the trapshooting equipment will be in readiness to entertain those who wish to shoot at any time.

The daily press recounts the death of Charles F. Bruning, an ex-Alderman of Mount Vernon, and formerly a prominent yachtsman. He died at his home in Kingsbridge road, Mount Vernon, on Nov. 17, from consumption. Mr. Bruning was a member of several yacht clubs, and of the Mount Vernon Gun Club, and Hiawatha Lodge F. and A. M., of Mount Vernon.

Dec. 4 has been fixed upon for the live-bird championship of New Jersey, between Messrs. T. W. Morfey, of Dover, and J. W. Hoffman, of New Germantown, the latter being the holder. In addition, there will be all-day sweepstakes at live birds. Take Central R. R. of N. J. to Somerville, whence stages will take visitors to the grounds.

The club house of the Richmond Gun Club, at Silver Lake, Staten Island, was burned on Wednesday of last week. The stove and some other property were maliciously smashed. All the indications are that the loss was caused by incendiaries. The club has already determined upon new grounds, easily accessible, and we are informed will hold a shoot on Thanksgiving Day, open to all.

Mr. F. P. O'Leary, of Buffalo, N. Y., erstwhile conspicuous in shooting matters, was a visitor in New York for a few hours on Tuesday of this week, en route to Chicago, where he will be for a week or two. He contemplates a visit to Milwaukee on Thanksgiving Day to participate in the live-bird shooting to be held there.

Mr. Carl Bittiner, whose single trigger device is world-famous, will sail for Europe early in December. He will visit Belgium, England and France. One of his purposes will be to establish a factory for the manufacture of the parts which compose the single-trigger action. He contemplates an absence of six or seven months.

After the shoot of the Erie Gun Club, recently, Mr. Eugene Doeinck gave to some members and friends a game dinner at 1355 Amsterdam avenue, New York. There were turtle soup, canvas-back ducks, venison and other viands galore, and an atmosphere of good fellowship to enhance the charms of the gathering.

The Jackson Park Gun Club will hold a live-bird shoot on its grounds, near Singac, N. J., on Saturday of this week, commencing at 10 o'clock A. M. Two events are on the programme, namely, 10 birds, $5, and 25 birds, $10, birds extra. Other events will be shot if time permits.

Some members of society, deficient in honesty, recently broke into the Fulton Gun Club's house, near the Old Mill, Brooklyn, and stole score pads, targets, etc. At the club's recent shoot there was a dearth of targets and a consequent shortening of the programme.

The Hell Gate Gun Club and the Emerald Gun Club, which hold their shoots at Outwater's grounds, near Carlstadt, N. J., will hold no shoot next month. They rest in July and December of each year, so far as trapshooting effort is concerned.

The Fulton Gun Club hold a meeting at Mr. L. C. Schortemeier's place, 201 Pearl street, New York, at 8 P. M. on Thursday of this week, to elect new members and other matters of routine club interest. Members are requested to attend.

At the shoot of the Crescent Athletic Club, Bay Ridge, L. I., Mr. H. B. Vanderveer scored a second win on the November cup, making a total of 50 with his handicap allowance.

Mr. D. S. Daudt, of South Bethlehem, Pa., eminent in the trapshooting activities of his State and vicinity, was a visitor in New York on Monday of this week.

Mr. W. L. Colville, arrived in New York last week, and arranged to remain till Thursday of this week, attending to business affairs.

The annex of the Hell Gate Gun Club, the target contingent of that organization, did not shoot on Friday of last week.

The Ossining (N. Y.) Gun Club will hold a prize shoot for members on Saturday of this week.

There will be no shoot of the German Gun Club this week.

ON LONG ISLAND.

Brooklyn Gun Club.

BROOKLYN, L. I., Nov. 15.—There were seven in attendance at the Brooklyn Gun Club's shoot to-day, and of these Mr. Wm. Hopkins, of Aqueduct, mighty in size and keen of eye, was easily in the lead. He made several straight scores, one of which was 10 thrown as 5-pairs. John Wright intends to make some activity in shooting matters in the near future. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	15	10	15	5p	15	10	5p	15	*	5p	20

No. 5 was for the Huntington District handicap.

A. A. SCHOVERLING, Cor. Sec'y.

Crescent Athletic Gun Club.

BAY RIDGE, L. I., Nov. 15.—Mr. H. B. Vanderveer made his second win on the November cup at the shoot of the Crescent Athletic Club to-day, thus having two out of the three contests to his credit. The weather was hazy and calm, conditions favorable for good scores:

November cup, 50 targets, handicap allowances added:

	Al'ce.	Broke.	Tot'l.	Al'ce.	Broke.	Tot'l.	Total.
H B Vanderveer	4	21	25	4	21	25	50
W J McConville	4	19	23	4	22	25	48
Dr Pool	3	17	20	3	23	25	45

W W Marshall	5	12	17	5	11	16	33

Trophy, 25 targets, handicap allowances added: H. B. Vanderveer (4) 25, L. C. Hopkins (5) 25, J. T. Skelly (0) 23,, H. M. Brigham (0) 22, Dr. Pool (3) 20, Dr. Keyes (1) 19, W. J. McConville (4) 19, W. W. Marshall (5) 18.

Shoot-off, 25 targets, handicap allowances added: L. C. Hopkins (5) 25, H. B. Vanderveer (4) 20.

Trophy, 25 targets, Handicap allowances added: Dr. Pool (3) 25, L. C. Hopkins (4) 24, H. M. Brigham (0) 22, J. T. Skelly (0) 18, W. W. Marshall (5) 17.

Contest, 25 targets: H. M. Brigham 25, J. T. Skelly 24, L. C. Hopkins 23, Dr. Keyes 19, Dr. Pool 18, H. B. Vanderveer 16.

Contest at 25 targets: H. M. Brigham 22, Dr. Keyes 22, H. B. Vanderveer 17.

Contest at 25 targets: H. M. Brigham 21, C. H. Chapman 19, J. T. Skelly 17.

Contest at 25 targets: H. M. Brigham 19, J. T. Skelly 18.

Contest at 25 targets: H. M. Brigham 21, J. T. Skelly 21, Dr. Pool 20, W. J. McConville 19, L. C. Hopkins 19, W. W. Marshall 14.

Contest of the Midnight Squad, 25 targets: H. M. Brigham 22, J. T. Skelly 15, C. H. Chapman 13.

IN NEW JERSEY.

Intercollegiate Match.

PRINCETON, N. J., Nov. 14.—There were four contestants, five-man teams, in the Intercollegiate match, held here to-day. They were Yale, Princeton, Harvard and the University of Pennsylvania. Each man shot at 50 targets, thrown at unknown angles. Yale won on a narrow margin, their score, 206, being one ahead of Harvard. The atmosphere was hazy, which accounts in a measure for the unusually poor totals.

Yale—Kinean 46, Hall 38, Rosenthal 44, Motter 37, DuPuy 41; total 206.

Harvard—Colson 40, Du Pont 41, Ingalls 41, Bancroft 42, Bell 41; total 205.

Princeton—Archer 47, Gaines 39, McCreary 43, Munn 37, Pardee 38; total 204.

University of Pennsylvania—Louder 33, Fitler 35, Robertson 32, Farwell 38, Adams 38; total 176.

Nishoyne Gun Club.

ORANGE, N. J., Nov. 15.—The Nishoyne Gun Club had a modest shoot to-day, on its grounds, High street, West Orange. The scores, 25 targets each event, follow:

First event: A. Mosler 17, R. B. Baldwin 16.

Second event: A. Mosler 22, R. B. Baldwin 22, F. G. Ward 19.

Third event: R. B. Baldwin 22, A. Mosler 22, M. R. Baldwin 18.

Fourth event: M. R. Baldwin 22, John Pearce 20, R. B. Baldwin 20.

Fifth event: John Pearce 21, M. R. Baldwin 20, F. G. Ward 18.

North River Gun Club.

EDGEWATER, N. J., Nov. 15.—Shooting commenced about the middle of the afternoon at the shoot of the North River Gun Club to-day and continued till the light was dim. Owing to the game season being now open, the attendance was light. The members cordially welcomed the visitors, and made it pleasant for them. Several new members were elected recently. The club is now out of debt and prospering. It contemplates holding a tournament, open to all, next month. The scores:

Events:	1	2	3	4	5	6	7
Targets:	10	10	10	10	10	10	10
Truax	8	7	6	7	8	8	..
Waters	9	7	7	7	8	8	8
Eickhoff	9	9	8	8	8	10	9

Moore	1	1	3	2	1	..	3
Allison	3	6	7	5	..	..	6

JAS. R. MERRILL, Sec'y.

Middletown Shooting Association.

MIDDLETOWN, Del.—The shoot on the Middletown Shooting Association's grounds on Nov. 14 had twenty participants, ten of whom were visitors from Wilmington. The principal event of the day was the five-man team shoot, 50 targets a man. The Dupont team won first place, the Middletown team second, and Wawasset team third. 2,100 targets were thrown from the magautrap during the four hours' shooting. The scores:

Team shoot, 50 targets a man:

Dupont Team—Waddell 43, Squires 47, A. Dupont 40, E. Dupont 43, Wheatley 29; total, 202.

Middletown Team—Barnard 43, Massey 38, Burris 42, Kates 35, Pool 31; total, 189.

Wawasset Team—Foord 34, C. Buckmaster 38, McKelvey 43, Dr. Buckmaster 37, Reutter 32; total 184.

Sweepstakes:

Detroit.

DETROIT, Mich.—Between being "chained to business" and off quail or duck shooting, the regular shoot, Nov. 15, was poorly attended. There was a squad, however, and they shot their best. Brodie beat Shiell in the club event in Class A, with 22; Hitchcock, in Class B, with 20, gained two points in the year's best ten club events by Guthard being away, and Ford had it easy in Class C. Following are the scores, the fifth event being at doubles, walking, and the last the club event:

Events:	1	2	3	4	5	6
Targets:	10	15	15	10	10	25
Brodie	7	8	12	7	6	22
Shiell	..	14	13	8	6	20
Babcock	..	10	5	4	3	13
Ford	..	11	7	9	4	15
Hitchcock	6	10	11	..	6	20

Ossining Gun Club.

OSSINING, N. Y.—Am sending herewith scores of the Ossining Gun Club, made at the regular Saturday afternoon shoot, Nov. 15. Bill Coleman came across the range during the course of the shoot dressed in approved hunter's regimentals; he had a good dog, a good gun, but no game, so he took it out on clays and made the only 15 straight score. There will be a prize shoot on the grounds next Saturday, 22d inst., for all members:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

C. G. B.

Nonpariel Gun Club.

CHICAGO, Ill., Nov. 15.—The Nonpariel Gun Club held its shoot to-day at Watson's Park, Burnside Crossing. Three members were in attendance.

The main shoot was at 50 targets, with results as follows: R. B. Mack 38, J. B. Barto 40, Dr. Carson 41.

Twenty-five targets, $1: Dr. Carson 20, Barto 22.

Twenty-five targets, for price of targets, Mack to have handicap of 5 targets: Mack (5) 24, Dr. Carson 21.

Twenty-five targets, same conditions as foregoing: Mack (5) 19, Dr. Carson 17.

JOHN WATSON.

He Tried His New Gun.

PINE ISLAND, N. Y.—A few days ago George Hunter, a brakeman on the Pine Island Railroad, went out on the Wallkill River in a dugout canoe to try his new $100 breechloading shotgun on ducks. He saw a duck, and blazed away. The new gun kicked like a mule and upset the boat. Hunter disappeared beneath the water, but came up again within reach of the boat and seized hold of it. The gun disappeared, and stayed there. The water was eight feet deep. Hunter floated about on the cap-sized dugout for an hour, and hallooed for help until he got hoarse. Then a man came along, got another boat, and rowed out and brought Mr. Hunter in.

The next day Hunter went out in his dugout, with a garden rake, to fish for his new gun. After dragging the bottom for nearly half a day, he got a hold of the gun. When he fired his gun off the day before both barrels were cocked, but only one went off. The hold Mr. Hunter got on the gun with the rake must have been on the trigger of the cocked barrel, for when the gun had been raised nearly to the surface, coming up butt first, there came a sullen rumble down below, and the next second the gun shot up out of the water like a skyrocket. It flashed by Mr. Hunter's face so close that it knocked his hat off. Mr. Hunter jerked back, and over went the boat.

As on the day before, Hunter went under and came up close by the upturned boat and seized it again. The gun repeated its programme of disappearing and staying there, only this time it was accompanied by the rake. Mr. Hunter was compelled to exercise his lungs once more until he was towed ashore by a neighbor. Next day he hired a man to go out and fish for the gun and rake. The man got them both in fifteen minutes. Hunter says he don't know whether to sell his gun or get another kind of a boat, or whether he had better lock them both up and lose the key. The duck escaped.—New York Sun.

PUBLISHERS' DEPARTMENT.

Mr. J. H. Randolph, of the Leesburg (Fla.) Gun Club, though out of practice and shooting at targets thrown hard, scored 22 out of 25 at a recent shoot of his club, using Peters ammunition.

The extraordinary offer made by the Schmelzer Arms Co., of Kansas City, Mo., of 3,000 blackbird targets, one blackbird expert trap, and a silver trophy known as the Schmelzer loving cup for $21—little more than the price of the cup—will undoubtedly attract the attention of many individuals and trapshooting clubs in the West and elsewhere. This house is one of the largest sporting and athletic goods houses in the world, and is widely known in the West and Southwest.

Experts on Guns & Shooting.

By G. T. TEASDALE-BUCKELL. Cloth, 390 pages. Illustrated. Price, $4.00.

The work gives the practical experience and personal views founded on practice of the leading gun makers of England. The subjects discussed are: The Evolution of Shooting During the Century; Shooting Schools; The Formation of Guns; Two Eyes in Shooting; Sights and Ribs to Guns; Style; The Shape of the Stock and Handiness; Cast-off and Bend; The Use and Abuse of the Try-Gun; Choke-bores or Cylinders; Pigeon Shooting; Game Shooting; Heat of Gun Barrels and the Effects Upon Them of Various Powders; Cap-Testing; Shotgun Patterns; Hidden Dangers in the Shooting Fields; Loading of Cartridges with Various Powders. The experts whose views are given are: Past-Masters Joe Manton and Joseph Lang; Atkin; Beesley, Boss & Co.; Churchill, Cogswell & Harrison, Gibbs, Grant, Greener, Holland & Holland, Jones, Lancaster, James Purdy & Sons, Rigby, Watts, Webley, Richards.

FOREST AND STREAM PUBLISHING COMPANY, NEW YORK

For Anglers and Big Game Hunters.

A Big Game and Fish Map of New Brunswick.

We have just had prepared by the official draftsman of New Brunswick a map of that province, giving the localities where big game—moose and caribou—are most abundant, and also the streams in which salmon are found and the rivers and lakes which abound in trout.

The resources of New Brunswick in the way of game and fish are only just beginning to be appreciated, and we are glad to offer to FOREST AND STREAM readers the first authentic information as to localities where sports may be had. The map is printed in colors, on a tough paper, and is enclosed in a stout manila envelope for protection in carrying. Price $1.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

OUR NEW DOG SKIN HUNTING COAT.

Made of finest quality black leather, full length, extra re-enforced, shield front to fit close around neck, extra high cloth-lined collar with strap, adjustable sleeves with strap and buckle at wrist. Fancy white stitched with rich plaid lining and double breasted.

Price, $10.00.

VON LENGERKE & DETMOLD, 318 Broadway, New York.

FIRST COST

VS.

OPERATING EXPENSES AND PROFIT

As Applied to the Modern Shot Gun.

You will hear it said that GREENER GUNS are high priced, and so they are—comparatively.

A trolley line is also expensive, and the cost to build an elevated railway is enormous, but if it is well done and the best material used they last indefinitely and begin to show a profit almost at once, even at so low a fare as five cents per passenger.

The same argument can be urged to the purchaser of a Greener gun. The first cost is considerable—necessarily so—for the labor is skilled, the material the best and the brains and experience of the maker all count for something.

Ordinary guns, and guns turned out by machinery, only last a season or two and are then discarded and begin a fitful downward career until they are finally lost in oblivion.

A Greener Gun, on the contrary, does not fairly begin life until it is several years old, and the few thousand shots that will rack the cheap gun to pieces simply smooths out the Greener and acts on it like oil on a fine bearing, and emphasizes those niceties of fitting that were part of the original cost, and which makes a gun really worth having.

Dr. Carver shot a Greener gun over a million times, and we have the gun here now—would not take $1000 for it—and it is in good condition yet after all these years.

If you want a gun that will shoot the strongest and the longest, pay a little more and buy a Greener. Eight gauge to twenty-eight gauge in stock. $100 to $600.

WINCHESTER .33 CALIBER
A NEW LARGE CALIBER HIGH POWER RIFLE.

BIG game hunters who have advocated a large caliber high-power rifle will find in the new Winchester .33 Caliber a gun that will meet their requirements. The popular and reliable Winchester Model 1886 Rifle has been adapted to handle this new cartridge, which is large enough and powerful enough to kill any big game known. The Winchester .33 Caliber Rifle is made in solid-frame or take-down style, with a 24-inch round nickel steel barrel and weighs about 7 3-4 pounds. The "Take Down" *lists* at $30.00 and the Solid Frame gun at $25.00. The Winchester .33 Caliber belongs to the high-power Smokeless-powder class of cartridges, having high velocity and flat trajectory, and which develop great striking energy and penetrating power. The .33 Caliber bullet weighs 200 grains, and with the load of Special Smokeless powder used in the cartridge develops a muzzle velocity of 2,050 foot seconds and a muzzle energy of 1,868 foot pounds. The penetration of this cartridge with a soft-pointed metal patched bullet at a distance of 15 feet from the muzzle is 12, 7-8-inch pine boards. Soft pointed bullets used in this cartridge have special upsetting, or mushrooming, qualities, owing to their high velocity. This makes the Winchester .33 Caliber a particularly desirable cartridge for big-game shooting, as mushrooming bullets of this size, have terrific killing power. For all practical purposes this cartridge is as powerful as the .30 U. S. Army or .303 British, and the fact that it is of considerably larger caliber is considered by some an advantage in its favor. Send for full description of it.

FOREST AND STREAM PUBLISHING CO.

CANOE CRUISING AND CAMPING.
By Perry D. Frazer. Illustrated. 95 pages, cloth. Price $1.
This interesting little volume is a practical guide for the cruising canoeist, the man who wishes to start away from the city and for a short time to make his canoe his home. With this in view, Mr. Frazer, who regards canoeing as a healthful and economical method of passing away leisure hours, has written briefly but attractively of canoes, camping outfits, clothing, firearms and ammunition; fishing tackle, photography, and in general of cruising, camping and all that pertains to this phase of outdoor life. While the volume has been written chiefly for the younger men, it is yet full of practical information and suggestion that appeals to those who have had a wider experience.
Such a book as this should be in the library of every man who is interested in outdoor life or the things which pertain to it. It is one of the manuals which should stand on the shelf alongside of "Woodcraft," of which, in fact, it is a part.

Samoa 'Uma

Where Life is Different.

By Llewella Pierce Churchill.

ANNOUNCEMENT.

Under the attractive title Samoa 'Uma, or "All Samoa," Mrs. Llewella Pierce Churchill has written a book for which she gathered the material during a residence at Apia, where her husband, William Churchill, was the American Consul-General. The conditions of life at the Consulate were most favorable for a study of the people, and with the instinct of a journalist Mrs. Churchill improved the opportunity to the full. As a woman she won confidences which would have been denied to a man, and acquired a vast fund of interesting lore which would have been withheld from one less sympathetic and less fully trusted. Thus she learned and has here described the real Samoa, that is the Samoans as they are.

The successive chapters give an admirably complete picture of a people in whom, as we read of them in these vivacious pages, Mrs. Churchill compels us to feel an unflagging interest. The book is well balanced; there is just enough of the history of Samoa to give an understanding of the events which have brought a portion of the islands under the flag of the United States; and just enough of description to make an appropriate and effective stage setting. But the chief characteristic of this brightly written book is action of incident and story. It is writing of the sort that has movement, and leads one on from page to page.

"Samoa 'Uma" is not exclusively about the Samoans; there is a chapter on Papalangi life, from which it appears that living in Samoa is so different; and some of the best things in the book are the personal experiences and adventures of this particular Papalangi woman, whose love of outdoor life led her on frequent excursions amid the coral reefs and into the dark jungles.

All in all, it is a book that will be read through, and read more than once. Here is the list of chapters:

CONTENTS:

I.—The Real Samoa.
II.—The Samoan Family.
III.—The Samoan Housewife.
IV.—Courtesy and Ceremonies.
V.—Kava—The Ceremonial Drink.
VI.—Music and the Siva Dance.
VII.—Handicraft and Art.
VIII.—Fishers and Sailors.
IX.—Shooting the Apolima Passage.
X.—The Weed that Catches Fish.
XI.—Torches on the Reef.
XII.—The Palolo Anniversary.
XIII.—The Chase of Rats.
XIV.—Things that Creep and Crawl.
XV.—The Wreck of the Schooner Lupe.
XVI.—Samoan Fickle Brides.
XVII.—The Vampires of the Tuasivi.
XVIII.—Beachcomber and Missionary.
XIX.—Copra and Trade.
XX.—Papalangi Life.
XXI.—The Story of Laulu's Hunt.
XXII.—The Great Vaiala Steeplechase.
XXIII.—Some South Sea Hoodoos.

NATIONAL MARKSMANSHIP.

IN our rifle columns we publish a communication from Mr. Charles Cristadoro in which he presents many cogent reasons in support of his contention that a high grade of rifle marksmanship should be acquired and maintained by American citizens at large, as a national policy with a bearing on possible wars of the future. But to interest the people at large in rifle shooting and to engage their material support of it, there must be offered an adequate incentive to induce action. No incentive, no action.

In pioneer days the rifle was both an implement of industry and a weapon of offense and defence. It was efficient in procuring a food supply, and in destroying savage enemies, beast or man. Under those conditions of life proficiency in its use was a vital necessity on the part of the early settlers. Self preservation, depending on one's ability as a marksman, is the greatest of all incentives to acquire marksmanship. The earlier settlers had it as a constant problem.

When the pioneer days merged into the days of communities and industrial development, the rifle, as a necessary adjunct of domestic life, became obsolete.

The cattle ranges superseded the wilderness as a source from which to draw a meat supply, and were a distinct advance over it in certainty of supply, quantity and quality. Also, the savages and wild beasts had been so near exterminated or driven so far into the wilderness that they ceased to be a factor in domestic life. The rifle, as a consequence, was not a necessity and it fell into disuse. There were left, here and there, some big game animals, the pursuit of which required the use of the rifle, but then their pursuit was a matter of sport, differing from that of the earlier days when their pursuit was a matter of necessity.

The efficiency of the revolutionary soldiers was largely due to their skill as marksmen, acquired in the ordinary routine of life as it existed at that time. Had they, in marksmanship, been no better than the citizens of the present time, it is a fair presumption that the history of the Revolutionary war would be of defeat instead of victory. It is clear that citizens now should be marksmen as the citizens were then, for wars are much the same in any age.

What the rifle was to the individual in pioneer days, it is to the nation at all times. It is an essential either in defense or attack. It is a dominant factor in maintaining peace, since it can destroy the bodies which disturb the peace. To command respect, consideration, and to hold a proper place in controlling its own and the worlds' affairs, the citizens of a nation must be riflemen.

To sustain general interest in rifle practice, however, after it has ceased to be a necessity to the individual, is a problem not easily solved on the first view, and yet easily solved if we keep in mind the essential condition that to promote the general use of the rifle there must be a general incentive.

Mr. Cristadoro has struck the keynote in his suggestion that the Government authorize a national rifle competition and appropriate a large sum to be distributed as prizes to the successful contestants. If, say, $100,000 a year was appropriated for the purpose, and it should evoke general interest in rifle shooting and a consequent general improvement in the marksmanship of the citizens, it would be a wise governmental policy on the score of economy. When a war occurs, as was the case not long ago, the Government necessarily expends many hundreds of thousands of dollars for ammunition used solely for practice. In addition, there are many months' time required to school new recruits in the use of the rifle. One battle lost from bad marksmanship might be a loss of millions. Marksmanship developed by governmental prizes might win battles.

The average man never attains the highest degree of skill by virtue of the irksome routine that he experiences as he does when he has an incentive which appeals to his highest individual effort, therefore the prize incentive would develop a higher class of riflemen than would the ordinary military drill.

The benefits of governmental interest in permanently establishing a high grade of national marksmanship is eminently illustrated by the situation which obtains in the Swiss Republic in this relation. Although a small nation, it has hundreds of shooting societies with enormous memberships. It is eminently respected by neighboring powers. Successful contestants at the periodical tournaments, beside the monetary prizes, receive distinguished attention and honors. Thus there is an incentive to strive for the highest skill, to gain sums which are of use in every-day life, and to secure honors which are gratifying to the just pride of every one who is ambitious to excel his fellows. Thus, while appealing to the self-interest of the individual, the power of the nation is trained up to the highest point of modern efficiency, offensively and defensively. In this manner, the judicious expenditure of a few thousands of dollars in peace may be the saving of millions in war.

METROPOLITAN GAME GROUNDS.

WE recorded the other day the occurrence of quail in the upper part of New York city. The problem of their origin now appears to be solved. Rev. L. H. Schwab informs us that a year ago this winter in the woods of Van Cortlandt Park, he started a bevy of quail, estimated to number twenty birds. These quail would probably not be greatly disturbed, since shooting and trapping is forbidden by city ordinance, and prevented by the city police. There would thus probably be left over a considerable portion of this bevy to breed, and it seems fair enough to conclude that the quail seen at Audubon Park were wanderers from the Van Cortlandt Park stock. Since the first quail was seen two more have been observed in the same vicinity.

Thus it may be perceived that New York is not without its game resources. More than this, we printed last week the story of a gunner's luck in getting a wild goose on Staten Island, which is within the city limits on the south, while in the northern part, in the Zoological Park, wild geese have been allured to the Bronx waters and trapped. There is still snipe shooting on the beach of Coney Island and at Rockaway, where centuries ago the Rockaway tribe of Indians hunted. No mean shots, by the way, were the New York Indians if we may credit the Reverend Charles Woolley, who was here in 1678-80, and who recorded of them that they lived principally by "Hunting, Fishing and Fowling. Before the Christians, especially the Dutch, came amongst them they were very dexterous Artists at their Bows, inasmuch I have heard it affirm'd that a Boy of seven years old would shoot a Bird flying: and since they have learn'd the use of Guns, they prove better marksmen than others."

BITS OF TALK.

THE MAN AND HIS CONSCIENCE.

"TAKE me with you," said his Conscience.

"Not by a long shot," said the Man.

"But I've been working hard, and need a rest; and there's no place on earth like the woods for a conscience to rest up," said his Conscience.

"I won't have a bit of use for you," said the Man. "You'll only be a nuisance."

"I'll be as still as a mouse," said his Conscience.

"But you don't know how to behave in the woods," said the Man. "You troubled me a whole lot the last time."

"Well, I wasn't used to the woods then," said his Conscience, "and I acted just as I would at home. But I know better now, I have been educated, and you won't hear me—not a peep."

"It is not the fashion for a man to take his conscience into the woods," said the Man.

"Nobody will know I am there," said his Conscience.

So the Man took his Conscience.

And his Conscience, being conscientious, kept the promise it had made not to jog the Man with any unseasonable hems and haws, nor to spoil sport with qualms, nor to stand between the Man and whatever the jacklight might show in the lily pads.

Moreover, it was as his Conscience had said, not a soul suspected that it was along. The guide supposed, of course, that the Man's Conscience was not with him. And this did not in the least surprise him, for guides are used to "sports" who either had no conscience, or if they have one, always leave it behind them in storage when they go into the woods. The Man had a rattling good time, and got what he went after. The trip had cost him a lot of money, and he had to have something to show for it. The State owed it to him, he said. His Conscience did not bother him a bit when, with the aid of a jacklight and a load of buckshot, he "got all that was coming to him," the all being, in this case, a fine set of antlers. In fact, his Conscience did its quietest to give him a good time. The Man appreciated this, and when they got back to town he said as much.

"Yes," said his Conscience, "I told you I was going to take a rest in the woods and I did I had a good long vacation and I feel better for it. I am healthier and stronger and weigh more than I ever did before. I am braced up for work. You can depend on me now, and if necessary, I can work overtime. By the way, how about that deer that you brought back?"

"See here," said the Man, "you were not to say anything about that."

"I wasn't? Well, I guess yes."

"You gave me your word you'd be still," said the Man.

"In the woods, yes," said his Conscience. "I did agree not to say anything about it in camp; but we are home now; and as I was saying, I am rested up and in good order. I want to know just what you think of that little jacking business? I mean, what do you think of yourself?"

"Oh, let's don't talk about that," said the Man.

"But let's do," said his Conscience. "What do you think of yourself as a man? Honest, now, was that an honorable thing for you to do? Between you and me, now that we are alone together, don't you know that it was a low down trick to break the law and kill that deer the way you did? If you didn't think it was, why did you give the folks that yarn about pulling him down on the jump? That's what you told your wife, and you lied to her, didn't you? The guide could tell a very different story. By the way, what do you suppose your guide thinks of you, not as a shot, but as a man?"

"See here," said the Man, "didn't you hear me say that I don't want to talk about that?"

"But I do," said his Conscience, "and I am going to."

SNAP SHOTS.

We are all of us likely to think, as we read each day of the multitude of shooting accidents—so called—which occur at the present time, that such mischances are something new, and arise from the use of high-power arms and from the great number of persons who now crowd the forests. Undoubtedly both these causes contribute to the frequency of such occurrences, but instances of shooting men by mistake for game are probably as old as the bow and arrow. Certainly the case of the English King who lost his life by a quarrel sent from a crossbow at a deer is familiar enough. Not so well known perhaps is the fact that in the year 1806 Capt. Merriweather Lewis, while descending the Missouri River on the return from the Pacific Ocean, was mistaken for an elk by Cruzatte, one of the men in whose company he was hunting, and was shot in the thigh, receiving a wound from which his recovery was long and painful. Cruzatte, who appears to have done the shooting, never actually acknowledged the deed, and Capt. Lewis at first thought that he had been shot by an Indian. But as no signs of Indian were found in the neighborhood, and as Cruzatte admitted that shortly after leaving Capt. Lewis he had fired at an elk, and as Capt. Lewis was clad in leather, which was about the color of an elk's hide, there seems little doubt as to what happened.

The four days which constituted the deer hunting season on Long Island gave opportunity for the killing of nearly 200. The number of grown bucks was comparatively small; does and fawns predominated. More than half of the entire number killed were killed on the first day; after the opening fusillade the deer took to the preserves and private grounds, where the army of hunters could not get at them. The number of deer killed in the Adirondacks, Protector Pond estimates, has not exceeded 4,000, as compared with 6,000 last year.

We print elsewhere the call for the annual meeting of the New York State Fish, Game and Forest League, which will be held in Syracuse on Thursday of next week. The organization is one in which every locality of the State should have representation.

The Sportsman Tourist.

In the Land of the Tin Cow.

A THICK gloomy evening—the lights of the city fading fast in the fog—and we were again on our way in search of adventure and the picturesque. The bay looked lonesome enough, and a solitary vessel we passed blurred itself into nothingness as we stole by.

Leaving the boat and boarding the cars, we don't find the bags where we expect them, pass on into the next; see that isn't the one, and then discover that we have locked ourselves out of our car and the train due to start any minute! However, we manage to get back in time, and the procession is at liberty to move.

It is dark; has been for two hours; there are no stars and no moon, though both are scheduled to appear, and the lights of the village of Point Richmond are a sorry substitute as we pop out of our first tunnel on our way south. We soon run into hot weather, and when we breakfast at Bakersfield are in the semi-tropics and far from the land of wind and fog. Off again, and it gets hotter and hotter as the day grows older, until the heavy coat and vest have to be hung up and the lightest we have donned instead. I have not brought a camera this time, and it hardly seems like traveling, but my want of success in Yellowstone Park last year has discouraged me, though Mrs. *** carries a kodak, and the binocular in its shabby worn case stuck on the shelf for the present, is all my light impedimenta.

Kern! Principally oil and odor. The country is either too hot, or too barren, or too something for even jackass rabbits and ground squirrels around here, or maybe they don't like the smell of oil; don't blame them, I don't either, but it has its merits. There are no cinders from the engine, though it does roar abominably, and no dust from the roadbed, for that is oiled too for miles. What it was before it was oiled, we get a taste of when we run over a short stretch of unoiled track, are buried in dust before the window can be closed, and half suffocated with the heat.

Near Wade a few ground squirrels show up, but I have come to the conclusion that if you really want to raise ground squirrels you must feed them well. Up North where the wheat grows is where the squirrel waxes "fat and sassy." Down here he seems to keep thin skurrying around in the hot sun trying to find something cool enough and soft enough to eat.

Most of the way we have no smoke from the engine, but climbing the steep grades makes even an "oil burner" smoke. Between breakfast and lunch we have to climb up and down some pretty steep hills, for from Caliente to Tehachepi is only some twenty-seven miles, but there are eighteen tunnels to go through, and the attentive porter informs us that it is "de greates' engineerin' freak in de kentry." We rise over 3,400 feet; then we drop 1,100 to Mojave, keep on dropping until we get below the 2,000-foot level somewhere near Hinckley, then rise sharply to Summit 3,819 feet, and drop as suddenly to Barstow, at 2,105 feet, in time for lunch. Sometimes we are up with the oaks and then down with the cactus and horned toads. (Note by Mrs. ***: "We didn't see a single horned toad in the whole trip.") The soil is either sandy gravel or gravelly sand; you can take your choice; the granite, where it shows, is decomposed, and the tops of the hills are all boulders, as if the soil had washed away and left the skull of the hill standing out to bleach in the sun.

Near Basko the inhabitants had moved the beds into the porches, and it was as hot as blazes. The barren hillsides and the equally barren plains were dotted about with doleful looking "yucca" plants (which, I believe, its other name is Spanish bayonet), looking like gravestones in a deserted soldiers' cemetery. In the intervals it grew hotter. At Mojave a pink girl got into the train, but it was too hot to look out of the window to see which car she got into. She left us after a while, but I forget where, because I grew interested in a new order of architecture, now first presented to our notice, the "tie house." Time was, when the "noble red man" made the climate even warmer than it is now; but he no longer chases the pale face over the plain, nor ornaments his girdle with the scalp lock of the unwary settler; he is to a considerable extent a "good Indian" now, since many of him are dead, but some of him work as section hands on the road. I don't think they work very hard; they don't seem to, but they work a mighty sight harder than I should want to in that climate; and even an Indian has to live somewhere, so somebody (probably not the Indian) devised the plan of utilizing retired railroad ties (the only lumber in the country) for houses. The house is limited as to its width by the length of two ties, sloping a little—a very little—and projecting somewhat for eaves: at a guess I should say that twelve feet was the width. A shallow trench is dug, the ties planted side by side (like a palisade) and a square, twelve feet by twenty-four, inclosed. This is divided into two tenements by a partition across the middle, also of ties. Then a space, probably regulated by the length of a tie again, is left, and two more exactly similar tenements erected. Another space, then two more tenements. A continuous roof of ties covers the whole affair, and upon this a coating of earth, gravel, etc., is spread. There is a door in each tenement close to the partition, a window at the back, and the stovepipes are stuck up through the roof in pairs.

The space between the tenements, open at front and back, but covered by the roof, give the only semblance of shade for miles around; and when the heat grows too great, the inhabitants sleep there. At other times they serve as lounging and gossiping places. As the ties, even though condemned, are from four to six inches thick, the dwellings must be fairly cool in summer and warm in winter; but how they get the roof tight for winter, I don't see—perhaps they don't try.

We pass a lake pretty soon—that is, it looks like a lake. We can see the birds flying over the water, and the bushes on the shore reflected in it; but as it grows larger and then smaller, and then larger again as we move swift- when we knew less about such things, for even now we ever seen. It is no wonder that people were fooled by it when we know less about such things, for even now we are not sure there is not some water there, until we ask the porter, who assures us "dere ain't no watter dere, sah; it's only a 'myridge'."

A real desert, and this is a real one, is the deadest thing in nature, but the clouds are beautiful. We had imagined that in Arizona and this part of California the sun shone out of a sky of brass, unbroken by cloud or hint of moisture, but that was a mistake, the clouds and the hints are there, but there is no moisture.

I made a sketch near Kramer because I thought it was so characteristic of Arizona scenery, and finished it all up and labeled it, only to discover that we hadn't got within a hundred and fifty miles of Arizona at that time, but it's got to stand all the same, for it looks a lot more like Arizona than it does like anything else. A distant range takes on a picturesque outline, and clothes itself in a warm brown; a rain cloud is discharging its contents among the mountain tops, and altogether "there's beauty in the desert," rimmed round by mountains as it is on all sides.

We sweep a long curve and draw up at Blake. We have traveled a good deal these last few hours, for we have passed through Siberia, Bagdad, Klondike, Amboy, Bristol and Cadiz, and Java is just ahead. The outline of the distant range is so peculiar that I find the best way to draw it is to try to draw a straight line slowly and let the car do the rest; and between us we are quite successful in getting the characteristic. In the middle distance, a circle of some five hundred feet or so is occupied by from six to a dozen whirlwinds, which send tall columns of dust high up in the heated air, while they chassez and pirouette with each other in a sort of witch's minuet. Over in another quarter the sun is setting behind a rain cloud, sending his beams to us through a veil of perpendicular lines.

The rain comes nearer, or we run into it, and with it thunder and lightning, until the landscape is lighted up like day for more than half the time, and here, for the first time, I saw a flash of lightning, not as it is drawn in the books, but as the photograph shows it to be, not the jagged zigzag of our infancy, no Jovian bolt with clean sharp angles, but a crooked, wavy, uncertain line, which for a brief season was flashed out in its whole length on the face of a cloud. That and one other flash were all I could distinguish, the rest were just sheets of flame.

At Needles we had to scuttle through the rain to dinner, fortunately not far, and somebody told us it was the first time it had rained there for a year. We were told that we should arrive at Williams (where we change cars) at five forty next morning, and asked how much time we required to get ourselves and our belongings out of the train. Half an hour seemed ample, and so we arranged it, turning in pretty early. By and by comes a knock on the door, and I say, "Hello!" and "All right," and then look at my watch. "Four A. M.! What the blazes?" But I conclude to dress, as long as I am awake. Mrs. *** thinks that an hour and forty minutes is more than she requires, so takes things easy, and about four thirty starts to get up. I am taking things easy, too, with my heels hanging over the upper berth, for my bag is packed and I am all ready. We begin to slow up—a knock on the door.

"Bags ready, sah?"

"Ready! No! When do we get to Williams?"

"This is Williams, sah."

"The devil! How long do we stop here?"

"Five minutes, sah."

I flew to the door of the dressing room, and informed Mrs. *** that she had just five minutes to get out of the train.

"But I can't!"

"But you must!"

And I proceeded to pack her bag. When I handed it to the porter, he was gray with fright.

How Mrs. *** managed it I don't know, though she has, I believe, explained the matter in detail to some of her intimate female friends, but in not much more than the allotted five minutes we made our appearance on the platform. I heard the porter say, "Dey're comin'," and the conductor's reply, "Well, it don't matter now, I've cut out the engine."

Sure enough, in desperation he had sent the engine on to the tank and left the train standing there, and Mrs. ***, not satisfied with holding up "bars" for their photographs, now holds the record for holding up the "Overland."

The trouble was that I hadn't noticed that we changed time just before we got to Williams, and my watch was consequently an hour slow. Having, for the reason that I hate getting up early, started from home at night, I now discovered that I had hung our expedition up at this forsaken place for thirteen mortal hours; but we managed to get through the time somehow, and it was about 7 P. M. when we drew out of the city of Williams, on the little jerkwater road that runs about sixty-four miles to the Grand Cañon of Arizona. There were but few passengers, and most of them seemed as unfamiliar with the adjustable chair seats as I was, and a good deal of the tedium of the trip was worked off experimenting with those articles of car furniture. Approaching the things with respect, we found them obdurate; but a brakeman, shaking one by the throat, as it were, showed us that it was necessary to take a firm grasp of the situation. With this example before us, we managed to make them conform to our various needs with no small degree of success. We had passed some time before out of the region of oil burners, and made our way now amid a brilliant shower of sparks, so continuous and persistent as to raise the question in our minds whether there was any coal remaining under the boiler, so much went up the stack.

A locomotive headlight mounted on a stand at the station at Grand Cañon illuminated the path to the hotel, and we made ourselves as much at home as possible in a room in a long barrack-like annex, where an abominable wire-woven mattress hung us up as in a hammock, and we woke in the morning full of aches and pains.

The railroad "folder" had warned us that we were not to expect "metropolitan luxuries" at the present hotel (there is to be a new one some of these days soon), but canned milk, eggs from Chicago, and bacon that seemed to have "been 'round the Horn" a time or two, was going, perhaps, a little too far in the other direction. Milk, I suppose, it was too much to expect, for there was nothing that a cow could have lived on in the vicinity; and every drop of water used at the hotel had to be hauled a hundred and forty miles; bathrooms, therefore, were conspicuous by their absence. The prevailing constituent of the "kitchen midden" in most parts of the world, is the tomato can, with its brilliant label for the delight of the predatory billygoat; but in this land it is superseded by multitudes of small round tins, each with two holes in one end, which line the railroads as well, showing that "bossy" is entirely without standing in the community, her duties being performed by the condensed milk can. For my part, I prefer "bossy."

After breakfast we watched a party of six or eight get ready to make the descent into the cañon, deeming it the part of wisdom to await the result of their experience, and after their departure set ourselves to get an idea of this "titanic chasm." The "folder" to which I am indebted for a good deal of my information on the subject, calls it "the greatest rift in the earth's crust," and when one looks at it, one is glad that it is the greatest; for if it were much deeper, I fear that this old orange we live on would be in danger of splitting open. From where we stood the river was not visible, so we essayed a short journey on foot down the trail, where we had seeen our companions disappear. The trail is a series of "switchbacks," very steep and covered with loose, rolling fragments of rock from the cliffs above. Notices at various points warn visitors not to roll rocks down upon the lower stretches, but it is more than difficult to avoid starting some of the smaller fragments which are displaced at every step.

We descended some distance—about five hundred feet, I think—traveling on that journey a half a mile or more, and seeing a comparatively comfortable resting place under a projecting rock, sat ourselves down to take in and realize as far as possible, the magnitude of the scene. That part of the journey which we had accomplished, seemed so small in comparison with the part to be done, yet would prove so arduous an undertaking on the return that we gave up the idea of any further progress on foot in that direction.

The scene before us and about us was one most difficult of description, and, truth to tell, rather disappointing, the brilliancy of color that we had been led to expect was not there, nor the variety of form. The overpowering magnitude and wonder of the scene grow on one in time, it is true, but it is somber and depressing in its effect; and all about is the barrenness of desolation. The sides of the cañon are a series of steps cut into fantastic alcoves and projecting bastions, and descending from a height, at the hotel plateau (not the highest point), is 6,866 feet above the level of the sea, to a sort of sloping plateau 4,430 feet lower. From here the descent is gradual for a couple of miles, then grows so steep that the horses have to be left behind, and the goal is reached at a further depth of nearly 2,000 feet to the river, which is 840 feet above sea level. The cañon at this point, therefore, is over a mile deep, and is about ten miles wide.

These dimensions are in no way appreciable; the eye, uneducated to such vastnesses, utterly fails to comprehend them; the marvelous purity of the atmosphere adds to the difficulty, and it is only after frequent trials and tests that any true idea is gained. Two pieces of paper in a patch of grass a little below us, resolved themselves with the aid of the binocular into two good-sized tents amid a grove of willows, and a moving ant or something was a man. There was nothing else to gauge by, not an animal, wild or domestic, appeared on the scene, not a house or tree broke the somber desolation; there was not even a bear for Mrs. *** to kodak. Near us were a few trees of fair size, but the distances were so immense, the drop from where we stood so sudden, that if there were any trees below us, they could not be distinguished from shrubs. We waited a long time for the party to appear on the trail, but failed to see them, either because they had already reached the grove and were resting there, or because we had miscalculated the difficulties, and they were still working the switchbacks of the trail.

If one were to attempt to convey to one who had seen nothing like it, the general plan of the cañon, I can think of no better way than to imagine that I am limited in my choice of material to an assortment of maple leaves. With these, then, we lay out the ordinary winding course of a river, increasing the size of the leaves for a space and then diminishing it again. This makes the main body of the cañon, and at frequent intervals we built in laterals of the leaves joining the main stream from both sides. These laterals again have feeders, and these again others, still using the maple leaf plan. Now, if one were to start at one end of the cañon and descend the river, he would travel, supposing he lived to get through, about two hundred miles, or a little more; but if he were to select the safer and more prosaic road along the edge of the cañon, he would travel probably between three and four thousand. So much for a birdseye view, except that while the cañon is about ten miles wide on the surface of the land, it narrows by successive steps and stages to the bare width of the river from two hundred to two hun- and fifty feet.

The geologists tell us that this is the most striking picture of the effects of erosion to be found in the world, but when one looks at it, the erosion idea seems difficult to reconcile with the thing as you see it. In the first place the rocks are hard as flints, full of quartz and agates and that sort of thing, and they stand up in walls that show small sign of elemental wear. These walls do not rise in sheer cliffs exactly as one would expect if the river had worn them away, but in successive steps. These steps again vary in size or depth, for while there are, so to speak, seven great steps in the mile rise from the river to the top step, the "treads" of these steps are broken up by a secondary series of steps, and over this and stretching half way up the "risers" of the big main steps, is a sloping mass of softer stuff which by contrast with the dark maroon rocks of the walls, looks almost like lodged snow. Erosion, however, seemed a little easier to understand when a mining engineer explained to me that there were three general series of veins in Arizona, one series running about east and west, one northeast and southwest, and southeast and northwest. These veins lie at different levels, and consist of decomposed and comparatively soft rock, bounded by walls of granite and the like. The river, finding its way into this soft stuff, worked down from one level to another, eating out a part of one vein and then a part of another, until over an area of thousands of square miles it had excavated and removed pretty much everything soft enough to be acted on by

water in a million years; but like a rather careless housewife, hadn't swept the corners clean. What the river took out it carried down to the Gulf of California or somewhere thereabouts, stopping to make a few deserts by the way. There are still a few points that are not exactly clear, as how a river two hundred feet wide could scoop out a trough ten miles wide, and a few other such conundrums; but give even a small river time enough and I suppose it can do almost anything.

A pretty steep hot climb brought us back again to the hotel, and as the attempt to get a cañon two hundred and thirty miles long, ten wide, and one deep, on a three by four kodak film was a little too much for even Mrs. *** we took pictures of each other perched on apparently paralyzing cliffs to humbug the stay-at-homes, as is the wont of travelers—because, of course, "the camera cannot lie."

After lunch we set out for a ramble through the mild kind of woods they have here, to a projecting point visible from the hotel, with the idea of getting a different view. Our road led us up with considerable rapidity, but having reached our designed point sooner than we expected (we were now rather inclined to over-estimate the distances), and being disappointed in the view, because, though grand beyond expression, it was in no way appreciably different from that we had had already, we continued our way until Rowe Point was reached at a level of 7,049 feet. Before us stretched the same interminable vista of re-entrant curves and giant steps, to all appearances, that we had seen before. They were in truth entirely different, but it would require an eye trained by much experience to detect it. I think, were one to miss his road and strike the cañon at any given point, he would be utterly unable to tell by any landmark, whether he was a mile or ten miles from the place he sought. With infinite variety of detail, there is infinite sameness of effect.

From our lofty perch we did get a glimpse of the river, a turbid stream broken by rapids, but a more careful inspection with the glass did not reveal any greater beauties, nor awaken any warmer desire to make its closer acquaintance.

The sun sinking toward the west gradually threw into strong relief pinnacles which in the morning had presented a totally different aspect; and these changes took place with sufficient rapidity to make it possible to note them, but still it was a change without a difference; and tiring of a view which in its dull hues and dense shadows was somewhat depressing, we set out on our return to the hotel.

At dinner we were rejoined by the party who had made the descent and waited with much interest to hear their verdict. One old gentleman had given out entirely and had been left behind on the way to await the return of the others; and at this meal he appeared a total wreck. Another whom I had sized up in my mind as the sensible and experienced one of the party, and whose report I was prepared to rely upon, said simply that the trip "was rather disappointing, and hardly repaid one for the fatigue." That was enough. I knew that he was putting it very mildly, and we decided then and there to confine our wanderings to the upper level.

We watched the train go out next morning with some interest, for it carried away every guest in the hotel save ourselves and two others. The "curio shop" proved to have few if any attractions. The Navajo blankets were most of them so suspiciously correct in their weaving that I set them down as probably either made in Chicago, or else from wool, and after patterns, prepared there; for the taint of commercialism is over it all, and there is a palpable air of being made for the market about everything.

The train having departed and the curio shop being exhausted, we set out for another projecting promontory known as O'Neill Point. By traveling along the brink of the chasm we managed to cover a good deal of ground and kill a good deal of time before reaching our destination, and the result was not wildly enthralling—that is, it was in no way apparently different from the other views. Looking at the cañon is a good deal like looking at the moon: no matter where you stand, you see the same old moon.

It wasn't too hot for comfortable walking, and the air was marvelously invigorating, but there was an almost absolute dearth of life; one solitary lizard and a couple of birds, I think, the sum total. There were no insects, not even mosquitoes, to enliven the scene, and the dogs didn't seem to have any fleas.

On the extremity of the point a cairn of white stones about six feet high, had been erected, and at one time covered with white cloth, doubtless to enable the surveyors to get sights on it from a distance, for triangulation. The stones were covered with pencilled names and dates, and the interstices stuffed with visiting or business cards.

Discovering that it lacked but twenty minutes of twelve, and knowing the reprehensible habits of punctuality which prevailed at our hotel, we set out on a hasty return journey, but we had not gone far before it began to thunder and lighten, and threaten to rain. Thinking that some time might be saved thereby, I suggested that we swing inland and endeavor to get on the stage road, but we wandered over a very considerable tract of timbered country before we found it. A "cullud gemman" appearing just at that opportune juncture, we inquired of him as to the distance and direction of the hotel, and then pushed on to get there before the rain did. It didn't rain very hard, but it thundered and lightened considerable, and the wind blew in savage gusts, likewise we were somewhat lightly clad, but Mrs. *** footed it like an athlete—long boots and short skirts are the things for good walking—and we reached the hotel with only a very slight sprinkling, just as the Chinese laundryman of the hotel was hastily taking in his whole morning's wash, which threatened every moment to take unto itself wings and fly over the brink of the chasm to the distant depths. Likewise, it was covered with dust, which was blowing in clouds, and would all have to be washed over again.

We were a little late for lunch, but hungry enough to catch up.

The unexpectedly overcast sky and gloomy weather where we had expected only sunshine (for we imagined that it practically never rained in Arizona), decided us to leave the next morning, though we had intended to remain much longer; but the exodus of so many of the guests and the somewhat unsatisfactory fare had a somewhat depressing effect. As I heard a man saying to an attaché of the hotel on the night of our arrival, "at Yellowstone there was something to do and something to see every day," and as he went away the next morning, I concluded that he had found it somewhat different here; I am sure we did. During the afternoon I found a tarantula cruising around in the rear of the hotel, and followed him, or her, for half an hour, to see what he, she, or it would do; without discovering anything of importance, and it at last took refuge under a log, instead of piloting me to its dwelling, as I had expected; then I went off and found some of the others, and rolling away the log, exhibited my curio. Meantime, a denizen of one of the neighboring tent-cottages came to see what I had found, and when she saw, took a big stick and lambasted the everlasting daylights out of the bug; she didn't seem to have any taste for tarantulas.

Then a pair of patient and long-eared burros came up from the depths of the cañon to take down the packs of a party expected by the train that night, who were to cross the river and proceed to a mine, or place where it was hoped a mine had been found, I don't remember which. Mrs. *** tackled the packer and engaged to take the pictures of his animals with their packs on the next day. By the way, this packer was the only man we met in any way out of the common; he was something of a character and gave us the only piece of information anybody had thought it worth while to waste on us. The name of the "Bright Angel" Hotel had seemed particularly inappropriate to the scene and its surroundings; a hopelessly plain building partly log cabin and partly clapboards, as uninterestingly ugly as a building could be, but the packer explained that when the intrepid Powell made his memorable trip through the cañon, never knowing what he would bring up against, and with so many perils packed into one journey that nobody yet has ever been able to do justice to the subject, the party came suddenly on a clear crystal brook pouring down a lateral cañon and mixing its purity with the muddy floods of the "Colorado." In his enthusiasm at the unwonted sight he christened it "Bright Angel Creek." Now, as it happened, in course of time, one of the few possible descents of the walls of the cañon was discovered on the opposite side of the river near this point; and it naturally took the name of "Bright Angel Trail," which was very well; but when they built the hotel there and called that Bright Angel, too, the thing became ridiculous.

Just about dark some misguided individual told Mrs. *** of some ancient and venerable Indian paintings under some overhanging cliffs, but after we had proceeded half a mile or less, I struck; for while it was possibly light enough to enable us to complete the journey there, it would be too dark to see our way back, and there is nothing soft to fall on in that country. Beside, we were no longer in climbing costume, and what is very good for high boots, is very bad for patent leather ties. Why the blazes somebody didn't tell us before, I don't see, for while I have my doubts as to the artistic value of Indian pictorial efforts, we would, under the circumstances, have been willing to devote considerable time to their examination.

Gee! didn't it thunder and lighten that night! One thirteen-inch Oregonian let go exactly over our room and seemed to lift the roof; then it traveled off down the cañon, making uncomplimentary remarks all the way for a hundred miles or so. After that it gradually quieted down, and we fell asleep.

It was a rather chilly morning, and the mists hung low in the cañon, making it more weird and mysterious than ever. By the way, we were greatly disappointed in the moonlight effect. I had arranged for a full moon, and it was there, all right, but the result was not at all up to our expectations. The great bastions and battleships and things didn't seem to stand out at all, as we had supposed they would; perhaps from the other side of the cañon it might have been better.

During the day there is a peculiar blue light in the cañon; not a haze, but seeming to be blue just as the sky is, because one looks through such a thick layer of air. There was certainly a sort of sky-blue effect after every vestige of cloud and mist had been dissipated by the sun.

Wandering around after breakfast, I came upon the pack train at the head of the trail in front of the hotel, all ready to begin the descent, but the packer, in much perturbation of mind, because he had promised a certain lady an opportunity to photograph the train when ready for the trail; and there was no lady armed with the deadly kodak, visible to the naked eye.

I knew who the missing lady was, but I had no idea where she was; so I lifted up my voice, and from the depths of the elsewhere came an answering and interrogative "Yes?" "Hi! get a move on with that kodak," I remarked, "not satisfied with stopping the 'Overland,' you're holding up a pack train now."

"B-o-a-r-d," says the conductor, and we started on the return journey. We passed a lot of lumber and things by a camp where stands a sign showing it to be a "forest reserve," so that I judged that there was going to be something of an establishment there. It wasn't much of a forest as forests go elsewhere, but it was much too valuable in this country to be left unguarded, and we were glad to see that measures were being taken for its preservation before it was too late. It would do to get lost in at any rate, and was near enough to the hotel to be quite convenient for that purpose.

Then I saw a chipmunk! It gave quite a homelike air to the scene; he seemed like an old friend. We hadn't seen any horned toads, no Gila monsters, only one lizard, and half a dozen black-cap jays, the land is desolate. Some miles further on we came to a small colony of prairie dogs, but they lacked the "sass" of their Montana brethren, and slunk dejectedly away, instead of sitting up and barking at us.

We caught the west bound at Williams, and at Seligman, about forty miles on, we changed time, and my watch became once more right, or, to put it more properly, the time once more agreed with my watch. Here, as at most of the stations, were a number of Indian squaws with pappooses, which you could photograph, for a consideration; or beadwork which you could buy, for four times its value. Generally, they were clad in dresses and flowing mantles of the most bizarre patterns, and colors of great variety; but the wearers themselves, as was evident to more than one sense, were uniformly dirty. The Arizona Apache and his kindred was a bird as a fighter, but if he was ever a clean bird, he has got bravely over it, though he has preserved his love of finery.

Soon we came, near Berry it was, to a series of the longest "tangents" that I guess ever were. For miles and miles the track lay on the plain like two ruled lines in the "First Lessons in Perspective," then it would swing slowly to one side and disappear behind a knoll, to be succeeded by another as long. I watched one of these tangents until I was tired out; we had descended something of a slope for about a quarter of its length, and this more than compensated for the curvature of the globe, the consequence being that the rails seemed to go on until they met at the foot of a telegraph pole in the dim and misty distance. I had made a rash vow that I would not leave the rear of the train until that line curved; and I began to think that darkness would be the only thing to save me; mile after mile the train thundered along; I saw hand-cars put on the track as we passed, and watched them follow us until they diminished to indistinguishable specks, and still the track lay behind us, a straight line pointing to the foot of that telegraph pole. At last the line began to swing a little, and lest I should be tempted again, I hastily quitted my post.

The porter told me that we ran down hill here one hundred and seventy miles without a break. At Seligman we were 5,260 feet above sea level, and a few miles back, somewhere about Pinereta, we must have been a couple of hundred feet higher. From about Truxton it is a steady descent to Needles, 477 feet above sea level, or a drop of 4,783 feet in the one hundred and seventy miles.

We routed out pretty early the next morning, though it was quite cold, to have a good look at the Tehachapi tunnels; and as we began the descent, forgot the chill air in the endeavor to pick out on the mountain side high above us, the hole we had shot out of half an hour before. The whole distance is done by gravitation; the oil is shut off and there is no smoke in the tunnels. I recognized some of the scenery I had noted on our outward journey, but it is a very different sensation sliding down hill thirty-nine hundred feet in less than thirty miles, from crawling up the same distance.

When we were, as it seemed, within a stone's throw of Caliente (really a quarter of a mile, I believe), we turned our backs upon it, then approached again, crossed our own trail, swung away, and back; and after some seven miles of travel, stopped for a moment at its little station, and twenty miles further on drew up at Bakersfield for breakfast.

Owing to an accident to a drawhead, we left Barstow last night three hours late, but by the time we reached Bakersfield we had made up an hour of it; and by judiciously cutting out "local" traffic, they sent in to the terminal station at Point Richmond practically on time, getting us home in time for a late dinner, and our much-looked-forward-to trip was at an end.

It was, I fear I must confess, a good deal of a disappointment; the journey over the desert is a particularly hard one, though we suffered as little inconvenience as seems humanly possible, and the fare is not exactly calculated to build one up after the fatigues of travel. Everything is done that I suppose can be done, but we shall hesitate some time before again venturing upon spending a vacation in Arizona, the Land of the Tin Cow.

The cañon itself, though grand and impressive beyond words to describe, is gloomy and monotonous in an almost equal degree, and the fact that no change of view point, possible under the circumstances, gave any real change of view, saving and excepting the laborious descent to the river, must, it seems to me (Mrs. *** does not quite agree with me here), always serve to prevent its becoming so popular with the ordinary sight-seer and tourist as are Niagara, Yellowstone, Yosemite, or many other places of the sort. ***

Old Eph's Turkey.

"Hit des like dis, ole man," said Aunt Mandy, "if yo' don' git me a tucky foh Thanksgivin' yo' kin des go widout dinnah, fo' we ain' goin' to have no hog meat Thanksgivin' dinnah in dis cabin." And she pushed back her chair and rose from the table where the subject of a Thanksgiving dinner had been under discussion. Uncle Eph also arose and carrying his chair to the corner of the big open fireplace where he usually rested after the labor of the day, sat him down to silent meditation.

He had exhausted every argument he could bring to bear upon the subject in an effort to convince his wife that they could not afford a turkey for Thanksgiving dinner, and that one of her fat hens, or even hog meat, would do.

She had positively declined to sacrifice one of her scant stock of hens, and indignantly refused to prepare a dinner of hog meat for the day of rejoicing.

While smoking and pondering the weighty problem of how to become honestly possessed of a turkey without being possessed with the necessary current coin of the realm, his gaze wandered to the opposite wall of the cabin and rested on his old gun hanging on its pegs.

"There, now, why not?" he thought. There were wild turkeys in the swamp, to be had for the killing, and although his eyes and legs were not as good as they had been, perhaps he might manage it. "Is I got enny powdah en shot, Mandy?" he suddenly inquired. The old woman was surprised at the question, and her curiosity was aroused, but she was still feeling indignation and resentment.

"I dunno if yo' is or not," she replied. "Hit in de box if yo' is." Slipping into his shoes, and laying his pipe on the fireboard, the old man crossed the room to where the box of miscellany stood and commenced an overhauling of its contents that finally resulted in the finding of a small quantity of powder (of doubtful age and quality), a charge or two of coarse shot, and some caps. Putting these several articles conveniently together in a corner of the box where they could be come at when wanted, he then climbed on a chair and lifted down the gun.

It was an old musket, not handsome originally, time worn, abused and rusty. Sounding with the ramrod, he found it empty. Lifting and dropping the ramrod several times, he then withdrew it, inverted the gun and struck the barrel with the flat of his hand.

"Hit sho' dutty," said he, gazing down at the little mound of black and rust, that ran from the muzzle. "Gimme a rag, Mandy?"

Without question or comment the rag was furnished him. Taking a pan of water to the fireplace, the old man began the arduous task of putting the old gun in commission. Through water after water he rubbed and scoured the foul and rusty barrel, until the water began to come back only discolored instead of inky black. With a pin he picked at the tube until he could blow through it from the muzzle. Then with a bit of bacon rind he rubbed the outside until the rust was well covered, and the gun presented quite a respectable appearance.

He now overhauled the box again, and after long search was rewarded by finding his wing bone turkey call. His wife, after finishing the dishes, had taken her seat on the other side of the fire and knitted away in silence, utterly ignoring this unusual performance.

When his preparations were completed, he said, "I goin' to bed, now, Mandy, so as to be up early in de mawnin'."

Her curiosity had stood the strain to the limit, and she asked: "What yo' gitten up so early foh?"

"I goin' huntin' turkeys in de swamp, an' I goin' git one, too, befo' Thanksgivin'; hit two days off yit."

The first ray of light glinted on the brown, weather-beaten coat of old Eph, well down in the depths of the swamp. It was a sharp, frosty morning, clear and still.

His wife had relented when she found him stirring around preparing for his early start, and offered to get him some breakfast, but for this he would not wait, as his long-slumbering sporting blood was aroused and he wanted to get into the woods by the time game was beginning to stir.

Many a weary mile did the old man trudge that day, and many "signs" did he see, but no turkeys.

Hungry, and all but exhausted, he arrived at home a little after noon, to find his wife entirely placated and a good dinner waiting. As he ate he explained to her that although he had not seen the turkeys, he had found their range and would go back in the evening and try to roost them.

A little before sunset he took his gun and returned to the woods, remaining absent until some time after his usual bedtime. The old woman was watching at the door for him, having become uneasy at his continued absence. "I didn't git nary one, but I found de gang en roosted um, an' buil' my blin', an' I des bet I do git one in de mawnin'," said he, in great excitement. His wife was catching some of his enthusiasm, and was beginning to have visions of a turkey Thanksgiving dinner. She helped him off with his muddy shoes, and sat him down to a bountiful supper, while she prepared a lunch for him to carry with him next day. They went early to bed, and after settling down, Aunt Mandy roused up to say:

"I goin' scratch roun' an' hunt some ches'nuts, to stuff my tucky wid, in de mawnin'."

An hour before day, Eph was stirring, and before it was light enough to distinguish objects in the swamp, he was crouched down in the blind, shivering with cold and excitement. He waited until a bird whistled off in the woods, and then got out his turkey call.

Once, twice, three times, with shaking hands, he tried before getting just the right position in the corner of his mouth, and then, "Put! Put! Put!" went forth on the still air, a perfect imitation of the timid call of a lonesome young turkey. His breath stopped as a quick answering call of "Quit! Quit!" came from a turkey in a nearby tree. Dropping his caller, the old man grasped his gun, wishing with his whole heart that he could tell the exact direction of the answering call.

Almost afraid to move, he crouched down in absolute silence, watching and waiting. Then he heard, off to the left, a rustle, the swish of wings, and the unmistakable sound of a turkey alighting on the ground. With no more noise than a cat would make, he twisted around on the ground until he faced the direction of the sound. Peering through the branches of the blind, he saw a turkey stealing noiselessly up toward him, stopping every few moments to peer cautiously around.

"Dat Mandy's tuckey," he whispered, as he laid his cheek to the old gun. "I dis hatter git him."

Taking careful aim at the full-rounded breast of the approaching bird, and waiting until it stopped for a look about, he fired. The resounding roar of the gun was yet sounding when the old man sprang over the side of the blind and made after the turkey, fluttering and threshing around, apparently in its death struggles.

Evidently badly wounded, it yet was making desperate efforts to escape. Snatching up a stick, he hobbled after it, striking at it whenever he came near, but all his blows fell short. The chase continued for some time, until finally, utterly exhausted, the old man fell across a down tree, while the turkey, recovering somewhat from its wounds, made good its escape.

Eph's heart was all but broken, and from the highest joy he was cast down to the deepest woe.

"What Mandy goin' say to me?" was his first ejaculation when his breath returned. Having made his way back to the blind where he had left the gun, he measured the distance with his eye to where the turky had stood when shot, and found it near enough to almost insure a kill.

"Hit was des nach'ly tuff," said he; "ole an' tuff. Couldn' er kill dat tuckey wid a ax."

Long and patiently he roamed the woods, not with any hope of success in securing game, but with a desire to postpone the sad homecoming.

A yellowhammer was bagged in the afternoon, and as he held it in his hand and mentally compared it with the lost turkey, tears dimmed his eyes. "I'll des pick it," he said, "an' tell Mandy hit wus a tuckey w'en I shot hit, an' dat a hoodoo was on hit, an' hit swunk."

This attempt at facetiousness failed to lighten his burden of sorrow, and it was with a heavy heart he turned his weary steps toward home. He had made a long circuit and was now at the far edge of the swamp, near the home of a prosperous planter by the name of Brown.

As he turned his attention was attracted by excited shouts in the direction of Mr. Brown's, and he concluded to go on and see what was going on there. He found Mr. Brown and several farm hands in the stable lot surrounding a small black mule that had backed into a fence corner, trailing a broken halter.

A young darkey, with torn and dusty clothes, sat on a stump rubbing numerous portions of his anatomy, evidently having been thrown by the mule.

"Howdy, Uncle Eph," said Mr. Brown, as the old man approached the fence.

"Howdy, suh," said Eph.

"Is yo' breakin' de mewl?"

"Trying to, but the mule is doing the breaking so far," with a glance at the boy on the stump.

"He sho do look wicked," said the old man, as the mule hitched around as though about to kick at one of the men nearest it.

"Wicked is no name for it, he is a little black demon," was the reply.

"He sho do look it," said the old man, as the mule spun round, showing the whites of his eyes.

The old man leaned on the fence resting and watching the efforts made to secure the mule for a few moments, when his attention was attracted to a fine flock of turkeys crossing the other end of the lot.

A sudden wild impulse took possession of him.

"Mistah Brown," he called, "what you' gimme if I ride dat mewl?"

"Git out! Uncle Eph. You are no mule breaker. He would kill you before you could get a leg over him."

But the old man meant business, and was now over the fence.

"I has rid mules, bad ones, too, an' I'll ride him ef yo' gimme a chanst."

"Well, I will give him to you if you will ride him," said the mule owner.

"I ain' wantin' de mewl, Mistah Brown, but I will ride him if yo' gimme one of dem tuckeys, suh," said the old man, pointing eagerly to the flock of turkeys feeding in the lot.

"All right, Eph, if you want to try it, but I am afraid he will hurt you."

"How long is I got to stay on him?" said the old man, stripping off his coat and rolling up his sleeves.

"Stay on until he goes down on the ground and you can pick your turkey."

The old man agreed to this, and the men closed in and secured the mule. The old man refused saddle and bridle, only stipulating that the mule be held until he got on.

Dragging the animal up to a post and taking a turn of the rope around it, the men held him while Uncle Eph carefully worked up alongside.

With ears pointed forward, and the whites of both eyes showing, the vicious brute stood until, with a leap and scramble, the old man lit on its back. The rope was then cast off, and everybody made for the fence. The old man clapped his legs to the mule like a pair of close-fitting calipers and gripped its slim neck with both hands. Quick as a cat the mule sprang into the air, its full height from the ground, coming down perfectly stiff legged. The old man's hat was snapped off, but his hold was not broken. Then faster than the onlookers could count the animal kicked for about half a minute, throwing its hind legs so high that it looked as though it would certainly somersault, ending with the old man well up on its neck. Then reversing, it reared again and again, all but going over backward, with the old man hanging in a close embrace around its neck. Then it plunged the length of the lot, with quick stiff-legged jumps right and left, breaking the old man's hold and nearly unseating him several times. Then it tried a general mix up of all the mule tricks, rearing, kicking, bucking and jumping, fully proving its reputation of being a bad mule, but though often hanging by a leg, the old man was not thrown. Breathless the spectators watched his plucky fight, occasionally shouting words of encouragement, but on his part he uttered not a sound.

The wild plunging continued until the mule began to show signs of distress, and, finally, in a burst of vicious rage, it threw itself down and rolled over, apparently trying to crush its rider to the earth.

Everyone ran to the rescue, and the old man was pulled out from the midst of the vicious animal's flying hoofs. They waited for him to speak to learn if he was injured. Looking up into the anxious face of Mr. Brown bending over him, the old man said:

"Do I git dat tuckey?"

"You certainly do, Uncle Eph," said that gentleman, greatlp relieved; "the biggest and fattest one in the gang."

"Les' go ketch him, den," said the old man, getting to his feet. "Dat is a rite peart mewl, suh," said he, as they passed his late antagonist, now very much subdued.

The turkeys were driven into a pen, and Uncle Eph was told to take his choice. The old man had his own reasons for passing by the big brown and bronze birds and selecting a slim, rangy, black one.

With its feet securely tied he bid Mr. Brown good-by; gathered up his coat and gun, and laid a straight course for home.

Well into the woods he placed the turkey on a log, walked off a short distance and fired his gun at it. It showed no signs of being hard hit, so he broke its neck with a stick, untied its feet, and swinging it over his shoulder, resumed his way.

"Heah is yo' tuckey, Mandy," said he, walking in on the old woman at sundown and proudly holding up his prize.

"Hi, ain' he fine," she exclaimed, an' fat," she added, lifting it. "I des knowed yo' was gwine git it, des nachly knowed it, an' I got de chesnuts all peeled an' ready. I des pintedly gwine give yo' de bes' dinnah dat any boddy evah eat to-mor'er, des yo' see if I don.'"

The next day, at noon, after a long and sincere thanksgiving blessing had been asked, the old man helped his wife to a generous supply of turkey and dressing.

"Dah," she said, as she disposed of the first mouthful, "Dis is tuckey. Dey ain' no meat got sich sweet taste as de wil' meat. Hit don' make no diffunce if folks is poah, an' kaint buy no tuckeys, if dey has a man what kin go in de woods an' shoot bettah ones den anybody kin buy."

And the old man, with one hand under the table rubbing a bruised and aching knee, accepted the compliment in pleased silence. LOUIS HOPKINS.

Spot.

SPOT was only a dog, but I thought more of him than I did of a great many men that I have known.

Spot's mother belonged to a doctor in La Grange, Tex., and in the spring of 1866 the troop of cavalry that I then belonged to was stationed there in the Freedmen's Bureau. I was a corporal then, and acted as deputy sheriff for a sheriff that had been lately appointed by the military governor of Texas.

While going up town one day I passed a small fawn-colored greyhound in front of the doctor's office, and after I had stopped to pet her and had gone on again, I found her following me. As it would not look well in the sheriff of Fayette county to be caught stealing dogs, I chased her back, or thought I did; but when I had got to camp I found her close behind me, and taking her to my quarters fed her, then took her home. When I got up next morning I found her in camp again, and again took her home, but she would not stay there, and after I had returned her half a dozen times, the doctor told me to keep her. I had expected he would, for he could not keep her now unless he kept her tied, and he did not want to do that.

Our captain took a fancy to her and kept her about his tent nearly all the time, and when we were ordered back to San Antonio, he had her put in the ambulance and taken along. From San Antonio we were next sent to Camp Verell, an old post long since abandoned. Here Nellie, the greyhound, had a litter of four puppies, two males and two females. Three of them were the exact picture of herself; the fourth was a white dog, the only other color on him being a black spot the size of a silver quarter under one of his eyes; he was as large as the whole three others when dropped, and kept on getting larger every day.

I examined him and came to the conclusion that he was three-fourths greyhound and the other fourth just plain dog, and made up my mind that he would be my share of this lot. The bitch was mine, but the captain seemed to think she was his.

When the puppies were about two weeks old, the captain paid them a visit one day, then calling me, said, "Take that dog to the creek and drown him. He is a nuisance here."

I looked at the pup and could hardly keep from laughing. The puppies were nursing, or trying to, but he was doing the most of it, shoving the others out of his way. He was so clumsy now that when he tried to walk he fell all over himself.

I won't drown him this week, I thought to myself, then said, "I think I should have one of these pups, sir."

"Certainly, if you want one. Select any one of the three; I'll keep the other two myself."

"You can keep three, sir; I will take the white one."

"Oh, he is a mongrel; he will never be fit for anything but to eat and sleep, and make a noise in camp."

The captain was mistaken about the noise, though. I had the dog two years, and never heard him bark. I don't think he knew how to bark.

"I think I can make a dog out of him, sir."

"You will never make anything out of him but what he is, a cur. But if you want him, keep him." That settled that; he was not to be drowned now.

"I'll take him from his mother in a few days, sir, as soon as I think it is safe."

"You might take him now. That fellow would live anywhere. But let him remain here. I don't want you to lose your dog."

I took him from the mother in a few days, for he was starving the other three, and taking him into the quarters fed him myself. I had no hesitation in taking him into those quarters; they were hardly fit for a dog. This post had stood abandoned for five years, and the quarters were in ruins; they never had been palaces, anyhow. When we came here we found them in charge of a herd of goats, and it took us a month to get rid of the smell of the goats and of their fleas; they left the fleas when we turned them out. I had a bunk made of green poles (we could get no lumber) in one corner by myself, and piling down a lot of old saddle blankets under it put the pup in them; but this bed did not suit him, and in a short time he found his way up on top of the bunk; and until he had got to be too big for his quarters he always slept between me and the wall or across my feet and legs; and while I had him I never went to the field on a scout that he did also; then he always slept beside me under the saddle blanket, and generally went first to bed, so as to be sure of getting his share of it. By the time he was five months old he was as large as his mother. He afterward grew to be the largest greyhound I have ever seen, standing at least two and a half feet high at his shoulders.

I thought it about time now to begin his education, and took him out to show him how to hunt jackrabbits; but found that he needed no showing; he probably had been hunting them in company with other dogs here for some time now. When the rabbit would show itself, Spot would go for it, and generally did not have to go far. A rabbit when Spot got after him might as well stop and wait. He caught them by the hindquarters, then held them for me to come and get; then if there was another in sight (these dogs run altogether by sight), he went and got it. The rabbits would try doubling on him. Most of our dogs when the rabbit did that followed the rabbit, doubling when he did. Spot knew a trick worth two of that. When the rabbit doubled, as he thought it had, he cut across lots and met it.

I tried him next, after he had got to be a few months older, on antelope. He caught them by the throat, threw them down, then lay on top of them and held them until I rode up and took charge. Then, if I had not kept him waiting too long, he would follow the band and get another. Three of us mounted took him out one day on the prairie that borders the North Concho, just where it falls into the Main Concho. This was our favorite ground to hunt antelope; they came in here after water, and the country back here is as level as a barn floor. Spot found a band, just as they were climbing up the bank out of the water; and pulled his first one down, not fifty feet from the bank. He got his next one in less than 600 yards; and pulled the third one down for me less than half a mile from the river. We kept close behind him then, and a man would be ready to take the antelope the moment the dog had pulled it down, then let him go for another cur. I have seen more than once a very fair cart

load of antelope brought into the post at Fort Concho. Spot had got them all, not a shot being fired.

I had been told that no hound would run a prairie wolf. Few hounds will, but I thought I had one that would, and sent Spot after them. He would hunt them if I sent him, but never went of his own accord. When passing them in sight, he would look at me, and if I stopped and said go, he went, but not before. But for a rabbit or deer he never had to be told to go. He caught and held the wolf just as he did the antelope, only taking care in case of the wolf to get hold of it close to its head, where it could not bite him. Then I would ride up and release the wolf. I did not want his skin, and made it a rule not to kill anything, even a non-poisonous snake or a 'coon, that was harmless when alive and no use to me when dead; and when I had any authority over enlisted men, as I often had, I would not let one of them shoot a coyote if the skin was not wanted. I have poisoned my share of them when I could use their skins.

With the big timber or loper wolf it is different. I shot them on sight if I could get within range of them. I killed a big loper once after I had run him two miles; then finding that I could not get in close enough to him without hurting my horse, I let him go, or he thought I did. Then, while he was busy watching for me to come the way he had gone, I rode around on his flank and shot him.

The coyotes would come into camp after night and eat the straps off of any saddle that did not have a man sleeping on it. We had to keep men sleeping on our packs at night to keep the wolves away from them. I was wakened up one night by having my saddle dragged from under my head, and I got up just in time to claim it; a coyote had it and I could not shoot him here. I wanted to do it badly enough, but did not want to raise an alarm in camp.

Spot would catch a buffalo as fast as he would any other animal; he began on them himself before I thought of sending him after them. Then I would send him when I wanted a laugh. He caught them where he did the rabbit, and an old bull when he found himself caught would whirl around to charge; but Spot would not be there then, and after the bull had got tired chasing him and had resumed his line of march, Spot would grab him again in the old place, then let go and get back and dance around just out of the buffalo's reach, and keep this up all day if I did not call him off. I often thought the dog was laughing as hard as I was; he looked as if he were.

When he was two years old my time in this troop was up, and I got ready to leave. I meant to take service as a cowboy down the country, and was going to take Spot with me; but the men had begged me to leave him, and I did so on their promise never to part with him. I should not have left him even then, but I did not really know when leaving here where I was going to. I might go north, and could not take him if I did, and did not want to leave him among strangers. Being a cowboy did not suit me, and I was only one for two months, then enlisted in another troop of this same regiment. I never got out of the regiment in my twenty years.

Two years after leaving Spot I was on escort duty on a mail route, the mail being carried on buckboard wagons drawn by two mules. The man on escort and the driver were the only two occupants of the wagon. We drove into the mail station a mile from Fort Concho one afternoon, the first time I had been here since two years before. I noticed about a dozen greyhounds in the stable yard here, one of them a big white one, and as I got down off the wagon, this one making a rush at me, got on his hind legs, then placing a paw on each of my shoulders began to lick my face, an old trick of Spot's. It was he, and he knew me the instant he saw me again. He had not seen me for two years now.

"That dog seems to know you," the manager said.

"He ought to; I raised him. How came he here?"

"Colonel Ficklin has him; he paid a cavalry troop $25 for him; he would not take one hundred for him now."

"Well, if I had him again he would not get him for a hundred dollars," I told him.

A hundred dollars for a dog might seem a big price to a man who only earned $18 a month, his board and clothes and medical attendance in case of sickness, to quote from the recruiting office hand bills, and I never needed that medical attendance either, but when I said I would not take that hundred dollars for him now if I had him, I meant every word of it.

Colonel Ficklin was a large mail contractor; he had about all there was in that line in this country then. He was a fine old fellow whom I knew very well. He made his headquarters in Washington, and died there some years ago suddenly, at a hotel dining table, I was told.

He paid regular visits here, bringing his friends with him, and kept Spot to hunt wolves for him. They would go out on horseback after night, and when Spot pulled the wolf down the colonel would put his brand on him, cut the wolf's tail off, then let him go. The country here was full of wolves carrying Ficklin's brand.

I afterward found out, when it was too late, that he had not paid a cent for Spot. The dog and half a dozen others had been given him by the troop when they left the Concho. The troop had a whole pack of them then, Nellie, Spot's mother, was to blame for the most of them being there. She contributed from three to half a dozen every year. The captain was absent when his troop left the Concho or Ficklin would not have got many greyhounds. The captain thought as much of a dog as I did, and knew a great deal more about one than I did; but he was away off in his estimate of Spot, and said so afterward.

Spot and I put in all this afternoon hunting jack rabbits, both of us on foot, and when we were ready to leave next morning Spot sat at the corral gate here looking on. I knew why he was here. "You had better tie that dog up," I told the manager, "he will follow me."

"You could not get that dog to follow you now, and stay with you if you tried. There is no danger of his following you."

"You will have another guess in about ten minutes," I thought. I took my seat and we started. These bronco mules were supposed to be half broken, some were, others of them were not. To get them harnessed and hooked to a wagon they would have to be lashed to a post; then when all was ready, one rope was taken off the mule's neck, the rope on the other mule passed to the escort to help choke them down if needed, and the mules taking the road now, would strike a ten-mile gait and never stop short of the next station, thirty or forty miles away. There was thirty miles between some, forty between others. They could not be stopped; but they could be driven in a circle, and when one of us had occasion to get out of the wagon, he fell off behind, then the other man drove in a circle until the first one had caught on behind and got in again. I have driven one of those teams half a dozen times in a circle before I could pick up the driver, when he had got off. These drivers were worked half to death, and finding that I could drive, they often would hand me the lines when clear of the station, then lie down on the mail sacks, after telling me not to hurry the mules, and go to sleep.

I would not hurry them until we struck a sandy road, then hauling in on the lines hard enough to stop any decent mule, it only made them run faster, and I would send them through that sand at a 15-mile-an-hour clip.

This is the kind of a team we had to-day, and as soon as they struck the road they were off. So was Spot.

The men ran after him, calling him, but he paid no attention to them.

"Keep on," I told the driver, "Never mind those men. I want that dog. He will follow me to Chadbourne, now."

He would follow me to the place the preachers tell us about, if there is such a place, and I were going there.

"I dare not go on, I would be discharged if I did," he told me.

"Then circle, of course. I don't want you to suffer."

He made a circle of a quarter of a mile, and as we swept past the corral gate again they got Spot.

Even after that, when I was there, Spot was always tied up before I left.

When Spot was six years old I heard from him again. There was a troop of ours at the Concho, and I corresponded with a sergeant in it. He told me that Spot paid regular visitis to the post and that he had been out with them on a scout for two weeks. He would always follow a mounted party and remain with it.

This troop was about to change stations and come to us at Fort Richardson, half-way across the State. I saw a way now to get Spot, and wrote to this sergeant telling him if he could possibly get Spot to bring him, and I would pay him $20 for his trouble.

Spot came into the Concho a day or two before this troop left, and the sergeant tied him up in the stable; then when they were ready to leave, turned him loose to follow. When half way up to our post they marched all day in a cold rain storm, and lay over next day, it being Sunday, to dry out. Here Spot took sick and in an hour was dead.

The sergeant had a grave dug for him, and had a cairn of loose stones built over his grave to keep the wolves from him. I got the location of his grave from the sergeant, and a few months afterward, when down here in charge of a wagon train and its escort, I camped here, and finding that the grave was in a spot that could never be used for any purpose—it was on the bank of a creek at the foot of a rocky hill—I cleaned the loose stones off the grave, then had a heavy flag stone carried down off the hill and put it on top of his grave. Then, while at the Concho, I made a small chisel, and when camping here on our return, with this chisel and a small hatchet that I always carried in my saddle pocket, I cut on the stone:

SPOT.
Born January, 1867.
Died March, 1873.

I was about to cut a cross on the stone to prevent any stray Indian from digging here to see what was under it, for a Comanche will not disturb a grave that is marked with a cross; and about the only Indians that ever came here were Comanches; and we had them pretty well cleared out now. But a friend here objected; he was a Catholic and did not want to see the cross on a dog's grave.

"I would not put it on every dog's grave," I told him, "but you knew Spot." Nearly every man who had been in the regiment in the last six years knew him. He still objected, and I left the cross off.

I always thought that Spot understood every word I said and that he could count. These dogs, while they are very gentle, I never knew one which was ill tempered, are not credited with having much intelligence, and have little sense of smell. I had always given Spot the credit of being a cross and not a full blooded hound; his size and the shape of his head made me think so; he had a hound's nose but his head was higher and wider.

I had a doctor who was a good naturalist, a correspondent for the Smithsonian Institution, examine him. He told me that Spot was not a mongrel at all, but a full greyhound, and that he had brains enough for two dogs.

I saw him do a trick once that gave me a higher regard for his intelligence. It will hardly be believed, but I will give it. In the field he always slept at my saddle, and as these saddles were all alike, I often wondered how he knew mine. Unless we had some mark about them we often could not find them in a moment ourselves. Yet he could go straight to mine any time. The leather hoods on the stirrups are generally too short when issued. I had cut mine off and put on a pair twice as long, but others had them as long as mine.

I had two small silver stars on the outside of each stirrup. They took the place of the copper rivets there, and no one else had any like them, they had cost me two dollars, and most men did not care to put that amount on a government saddle.

We were on a scout, and while in camp one evening I noticed Spot examining the saddles; he would walk past each one, look at it, then go to another, and kept this up some time. My saddle lay by itself, and I had the stirrups both laid on top with the blanket folded and laid on top of them, covering them. He finally stopped in front of the saddle, then pushing the blanket off with his nose, looked at the stirrups, then lay down. If he was not looking for those stars, what was he hunting for?

Trent and Tributaries.

THE gray dawn was forcing a light through the heavy mists, and a deep chill was in the air. Up the river the boat was swiftly paddled, and, as the light grew, the waters sparkled like molten silver. The gnarled oak seemed clad in lace mantillas, so soft was the effect of Spanish mosses, that clung to them so affectionately. Peering in the wooded depths one conjectured the delight of an encounter with Bruin, or the antlered monarch of these wilds; again, the visions of vanishing turkey would be forced upon our vivid imagination, until the hist of the boatman gave warning of our real intentions. Afar in the hazy distance a dark blot appeared, following the river's course, and on a direct line with our boat, but high in air; swift as an arrow the line came nearer and nearer, and now the supreme moment arrives. Holding well ahead of the leader, we see the third bird drop slowly backward, and soon with set wings go hurtling to the waters below. What delight fills one to have the first shot of the morning successful? This bird is gathered, fondly examined and carefully laid away with the hope that it will soon have companions; this success was mere accident, as the birds are wary, and seldom under such conditions does one secure a shot within range. On and on in the morning's silence, past marshes where the waters swirl in great pools and eddies, making no sound, but we are ever on the alert for our quarry; now a bird rises from the dark marsh and cleverly swings to the stern of our little craft. My boatman is not quick to meet the condition, so no shot is fired, it being impossible to turn in the cramped quarters of the bow; another bird rises, followed by still another, and two beautiful misses are scored. Yet is not the crisp morning air filling our lungs, giving us new vigor, new life, brushing the cobwebs from our brain, and making us well content to live over such glorious days in sweet reminiscence? Now a little creek is entered where the branches overarch and intertwine; the silence is oppressive; the paddle falls with precision, every turn reveals new beauties as the sun gleams through the overhanging shadows; every sense is alert and the tension is to the point of breaking. With swift-beating pinions a wood duck strives to break through the heavy mass above, and succeeds only partially, as a snap shot, that will live while memory lasts, brings him to earth. After much labor he is placed beside his less handsome fellow, and admired as the most beautiful of his kind.

Here is every hue of the rainbow: glowing iridescence at every turn, the most harmonious blending of gorgeous coloring ever conceived by the wonder worker of nature.

A few shots are secured with indifferent success, as the biting cold and the long hours in one position incapacitate a novice from the possibility of a clean score. We lunch in an old field, shielded from the wind by a great oak, and endeavor to relieve our rigid muscles by violent exercise immediately after our meal, but the fascination of pursuit will not allow a long rest. Positions are again taken in our contracted craft (a small boat only being practicable for river or creek shooting in this locality), and the sinuous windings of the stream followed, till a narrow creek is found; this being entered, soon widens to a lagoon, and, on making a sharp turn, we suddenly flush a flock of mallards. Great was the consternation both of the ducks and shooter, and the first barrel was a sure case of duck fever; but nerves being suddenly controlled, the second secures a magnificent specimen of a male bird, enlarging the bag to three. As the dying sound of wings portrayed the departure of the flock to less troublous waters, we began the return journey in mid-afternoon, floating lazily along with the current, turning in the likely looking places, but quite content with the small showing made.

As the evening shadows fell, great banks of murky clouds loomed up beyond the receding woodlands, through which the dying sun pierced the waters. Here was light, there was shadow, and all about the silent world; no human sound reached our ears, no cry of beast or bird, no sail appeared, no hunter's craft cleaved these waters save our own; yet the lights, the shadows, and the silence, filled my soul with delight; far from the ceaseless sounds of strife, near to nature's heart, near to the real life. The wharf is reached, and soon the hotel, and then after a hasty toilet the inner man appeased. A recital of the day's experience follows with fellow members of the craft, then to rest, and pleasant dreams. Again the waters curl at the boat's prow, ripples rush hurriedly away, and then die in the water's vast expanse. The swish of wings is to us sweeter than the music of harpsichord, and the day is repeated, delight upon delight; overwrought nerves are restored to healthful conditions, over-tired brains find rest and peace, and we feel again the true joy of living.

Natural History.

The Hermit Crab.

THE war lately waged in the various warm and peppery Spanish islands had a chapter of crabs contributed not only from Cuba, but from the Ladrones and the Philippines as well. In every report, save those which have passed strictly "through military channels," as the regulations phrase it, it was made clear that the variety of indigenous crabs aroused as much wonder as disgust.

The operations about Santiago gave the soldiers an opportunity to watch the land crabs taking vengeance for many a soft shell or a shedder which had been employed for the nutrition and the appetite of man. If some sentry, keen to watch the lines and to recognize the slightest indication of the approach of the enemy, had turned out the guard to resist no more deadly attack than the nocturnal march of the land crabs, he could not have been ridiculed. The same marauders have turned out guards before this last war; it is a matter of history that they caused a terror-stricken flight of a British army in the same province. The noise in the jungle was so alarming that the British were sure they were facing a vastly superior force having also the advantage of position. Rather than accept battle under such adverse conditions, the invaders decamped in a hurry, routed by the land crabs.

In the Philippines and at Guam, the crab found on land is not at all the land crab of Cuba. Although quite as noisy, it is by no means as large as the disgusting Cuban animal; in fact, it is rather amusing than otherwise. This is the hermit crab, which is condemned to pass its life in a succession of unfurnished lodgings, the shells of molluscs which have outlasted their original tenants and have been taken by the hermits. The hermit has a large amount of protective armor and offensive weapon of attack, but they are all in front. The tail is not only bare of all protective shell, it is, indeed, covered with the very thinnest sort of a soft skin. The hermit is very vulnerable in that part of his body and stands a very feeble show for his life unless he can find an empty shell which will fit. When one shell begins to cramp him as he grows, it is necessary to hunt for a larger one and to transfer his quarters to that. It is a critical time for the hermit when he is about to move. After long search he has found an empty shell, which seems to be about the right thing. He has explored its recesses with his smaller claws and has carefully swept out the grains of sand. But experiment is the only way of making sure that the new lodging will suit. There must come a moment in which the hermit is out of the old shell and into the new without knowing certainly that he will not have to go back to his old quarters. There is a chance that some bird may be in a position to snatch at his soft tail as he is making the change, against that his protection is the rapidity of his lightning change. But while he is testing the new home another hermit may come along in search of lodgings and then there is sure to be a combat.

In Luzon and the other Philippines they are to be found of all sizes up to that of a coffee cup. They run everywhere about the houses by night and are quite harmless. But they make so much noise, their racket is so wholly out of proportion to their harmlessness, that they may well alarm a sleeper in a strange place and doubtful of his neighbors. To a certain extent they are beneficial, for they undoubtedly destroy multitudes of eggs of that pest of the Orient, the cockroach. That, in itself, is enough to win pardon for the hermits for all the noise they make in the still nights by the scratching of their claws on mats and woodwork and the thump of their heavy shells as they take sudden fright and fall from chairs and tables to the floor.

LLEWELLA PIERCE CHURCHILL.

Red Squirrels and Raccoons.

IT is the case that red squirrels will come out in June into towns and cities in Maine, but usually they are in small numbers, and after destroying all the eggs and young of all birds' nests they can find, they in a short time return again to the woods. This year has been an exception. They came as usual in June, but in much grater numbers than I ever knew before. They literally came by hundreds. I have seen three at one time in my garden, and people all over town would report seeing them in numbers in the same day. As usual, they destroyed every egg and young bird they could find. I took particular pains to inquire about this, and had the same report from other towns. I am aware that Hermit says this Cape Cod squirrel does not trouble birds' eggs. This is the only case where I have found that his observations differed from mine, but I am sure that our Maine red squirrels do destroy both eggs and young birds, as I have seen them when doing it. Contrary to their usual custom, many of the squirrels have remained and some are here at this date, Nov. 15, although it is over a mile to the first little grove of evergreen trees. One has been busy in the September days storing hundreds of horse chestnuts in my attic, and is seen every day or two near the house. Lately he has been carrying off large bunches of mountain ash berries.

The raccoons were later in coming. The first known of them was when corn was first fit to eat. Then any one who had a garden or patch of corn just outside the thickly settled parts, all at once found that the raccoons were at work nights. I know of over thirty killed in a space of not over eight miles long by two wide, and I do not think that I heard of two-thirds of what were taken. These were nearly all caught in traps set in gardens and corn patches. One was caught which weighed when the entrails were all removed, thirty-two pounds, and another also disemboweled weighed twenty-six pounds. I know these weights to be correct, as they were weighed on two different sets of scales. When the corn was all gone they disappeared as suddenly as they came.

M. HARDY.

BREWER, Me., Nov. 15.

The Murder of the Young Among Birds.

Editor Forest and Stream:

At a recent meeting of the Institut Général Psychologique, a section of which is devoted to matters of zoological psychology, a well-known naturalist, M. Kunckel d'Herculais, quoted a fact observed by himself personally. A pair of canary birds, already blessed in previous years with a numerous progeny, gave birth to three young ones. Matters go very regularly and smoothly, to begin; but one day while cleaning the cage, an unskillful hand hits the nest, and the nest falls. It is immediately restored to its place, the young, which had rolled out, being delicately put in again. Nothing particular occurs, or is noticed till a few days later, when it is discovered that the parents behave in a most extraordinary manner. The mother has expelled one of the young from the nest, and is dragging it toward the bathing dish, and she forces it under the water repeatedly, "till death ensues." The next day, murder number two, conducted by the same person, in the same manner exactly. But the tragedy stops here. Number three is not murdered. On the contrary, the parents make a great show of tender feeling and display great care in the nursing of their only heir. The latter gets on very well, but when nearly adult, it is remarked that some toes of one of the legs are in a state of marked atrophy. The heir is in fact an infirm, or at least an invalid; his infirmity, however, does not keep him from becoming otherwise prosperous.

Now the query is, Why did the parents murder numbers one and two? Can it be that all the young were injured by the fall; that the parents recognized the gravity of the injuries—hypothetical, mind; no one can tell whether they existed or not—received by numbers one and two, and recognizing the difficulty, or impossibility of rearing them, decided to do away with them, and not to lose any pains and trouble uselessly? Can they have considered number three as having reasonable chances of "pulling through"—as Adam remarked each Sunday, according to Mark Twain's latest revelations on the beginning—and therefore spared his life? The question is put to such readers of FOREST AND STREAM as have had similar experience; will they kindly give information as to the facts they have observed, and as to the interpretation they give thereof? Facts concerning other animals than birds would prove quite as interesting, of course.

Now as to another form of infanticide. It is popularly believed in France, among the uncultured principally, that when young birds are taken, with the nest, and put in a cage to which the parents can easily come, without being able to get in, of course (the cage is, for instance, suspended in the tree close to the place where the nest was made) the parents who generally do not abandon their young, come to the cage, and bring them food, but also, in many cases, bring them poisonous food, so as to kill their captive progeny. It sometimes happens that they kill it otherwise by beating it on the skull; it happens also that they do not kill it at all. But it is believed that the poisoning process is rather extensively practiced. Query: Does the belief exist in the new world; can any facts be adduced in its favor?

HENRY DE VARIGNY.

PARIS.

A Ward for Yellow Journalism.

JEFFERSON BARRACKS, Mo.—*Editor Forest and Stream:* Your Nov. 15 issue reminds me of the old yarn about the missionary who, having been sent to convert the Esquimaux to Christianity, set about doing so in the way he had always done, viz., by telling them of the endless punishment awaiting all unregenerate beings upon their passage from this life. He appeard to do well enough until he began to depict the fire and brimstone details, when, to his surprise, he found his hearers in all eagerness to join the ranks of the unbelievers, so that they might thus secure the boon of perpetual heat after a lifetime in the frozen regions. Now I am something of a metaphorical Esquimaux. I knew nothing of yellow journals until the missionary labors of the FOREST AND STREAM taught me that they appear to be a class of newspaper that urge the devotees of fashion to go out and observe interesting and attractive little animals frisking about in a state of nature, rather than, by creating an abnormal demand for their pelts, to stimulate the market-hunter to compass their entire extinction. This description has made me an ardent believer in yellow journals; they appear to teach the doctrine I have long favored; and if they will enlarge their scope to include song and insectivorous birds as well, they can occupy a place at my elbow right next to the FOREST AND STREAM itself.

Proprietors of shooting resorts will find it profitable to advertise them in FOREST AND STREAM.

Massachusetts Interests.

BOSTON, Nov. 15.—*Editor Forest and Stream:* A convention of sportsman's, farmers' and other clubs was held on Nov. 13. The meeting was a large and enthusiastic one. Game protectors came from every county and almost every large town and city in the State, to the number of eighty or more.

A. B. F. Kinney, chairman of the Central Committee and vice-president of the Massachusetts F. and G. P. A., presided. George W. Emery, ex-governor of Utah, and Col. E. M. Stoddard from Marshfield, represented the South Shore. Gen. Francis H. Appleton, of Hamilton, Senator-elect from Essex, representing his section and the Society for Promotion of Agriculture; Leander Herrick, of the New England Agricultural Society and the Worcester Fur Club; Dr. W. G. Kendall, vice-president of the Megantic Fish and Game Club; Heman S. Fay, the League of American Sportsmen and the Marlborough Gun Club; I. O. Converse, the Fitchburg Rifle and Gun Club; several new clubs, the Groveland, Georgetown, Northampton, Greenfield and others, beside farmers' clubs and several deputy fish and game commissioners. After two or three speakers had been called upon, a general invitation was extended to all present, and the opportunity was very generally availed of. The majority of those in attendance had something to say.

Resolutions were adopted in favor of the re-enactment of the anti-sale law; the deer law and the giving of further right of search to deputies.

A committee, of which Mr. Fay was chairman, reported in favor of continuance of the Central Committee, and reported as its executive committee the following: Chairman, H. A. Estabrook, of Fitchburg; Secretary, H. H. Kimball, Boston; A. B. F. Kinney, Worcester; A. C. Sylvester, North Attleboro; Salem D. Charles, Boston; H. S. Fay, Marlboro; Chas. H. Sawyer, Northampton; Wm. B. Phinney, Lynn; J. B. Bridges, Deerfield; H. P. Bryant, New Bedford; Joseph H. Wood, Pittsfield; J. Russell Reed, Boston; H. C. Tuck, Haverhill.

A vote of thanks was unanimously tendered Mr. Kinney for his efficient and untiring efforts in the cause of protection during the past three years as chairman of the Executive Committee.

After an hour's intermission the association was called to order by Vice-President Wm. S. Hinman. Several propositions for membership were presented, and six candidates were duly elected.

A nominating committee of seven, of which Dr. E. W. Branigan is chairman, was named by President Hinman, when the meeting was adjourned and the convention again opened.

The name of Congressman W. S. McNary, of Boston, was one of those proposed for membership.

Several State senators and representatives were in attendance, several of whom spoke and expressed their pleasure in attending and their purpose to favor all reasonable requests from the sportsmen.

Speaker Myers, who will doubtless be re-elected to that position, was among the speakers. Several of the guests from different sections of the State also spoke. This meeting, if not equal to the convention of 1899, was a very close second, and has put the anti-sale law and other measures distinctly before the people of the State, the press having given quite full reports of it.

HENRY H. KIMBALL, Secretary.

BOSTON, Mass., Nov. 18.—*Editor Forest and Stream:* If there have been those in the Old Bay State who have thought it safe to violate the game laws recently, because several of the most active game wardens were occupied in the distribution of fish, and were literally working night and day to stock the ponds and streams with trout, landlocked salmon and white perch, some of them at least have had a rude awakening within the past three days. It is only just to say that this recent work of the wardens, although remarkable for notable cases, is only a continuation of the liveliest campaign this old State has ever witnessed for the repression of illegal hunting and fishing.

Last Saturday and Monday three convictions were obtained, which not only cause immense satisfaction to sportsmen throughout the Commonwealth, but in each case the conviction was due to detective skill that would do credit to Scotland Yard, and which must impress those disposed to transgress the fish and game laws with the idea that it is decidedly unsafe to continue in illegal practices.

One of the cases referred to is specially interesting because it is the first occasion, since the enactment of the non-sale law for partridge and woodcock was enacted two years ago last July, that any one has been caught red-handed in the act of trying to sell either of these species. Some ten days or so ago information reached the Fish and Game Commission that there was reason to suspect one William Ellis, of Monterey, in the southern section of Berkshire county, was selling, or willing to sell, partridges. Deputy A. M. Nichols, of North Adams, was ordered to make a preliminary investigation, which he did. Upon his request for help, Deputy A. D. Putnam, of Spencer, was wired to join him. The information which the Commission has received shows that the case was worked up as follows:

Where Ellis lives is eight or ten miles away from a railroad, and in a notably wild bit of country, especially for Massachusetts. Last Friday night Nichols, posing as a person interested in a match factory, called at the home of Ellis and made inquiries about a piece of pine timber land in the vicinity. Nichols then returned to Great Barrington, where plans were laid to entrap Ellis, and where the co-operation of Police Officer Smith was secured. It was determined to go to Monterey Sunday, and as Officer Smith was unknown to Ellis, and was interested in the work, it was thought best that he should play the part of a hunter from Lenox, who was anxious to get a good lot of game, whether he shot it or not. It is evident that there might have been cause for suspicion on Ellis' part if Nichols, the supposed match factory agent, had indicated a desire to purchase partridges, and for this reason he decided it was best for him and Mr. Putnam to keep in the background, while Smith carried on negotiations.

These details having been arranged, the three—Nichols, Putnam and Smith—drove out of Great Barrington early Sunday morning, and away over the hilly country roads for Monterey. It matters little that the morning slumber of some late sleeper in Great Barrington may have been disturbed by the whirr of wheels, "rattling o'er the stony street," as the trio headed away for the wooded country. However that may be, the officers in due time reached the vicinity of Ellis' house. But instead of going directly to it, they drove into a back road near the house, hitched the team and then disguised Smith, who was rigged up in a hunting suit, equipped with a gun and bird, and fitted out with a lunch. He was then shown Ellis' house and instructed to go there and ask for a drink of water. Also he was told to go into the house, put his gun down, lay the bird beside it, produce his lunch on the pretext of being hungry, and improve any opportunity to get into conversation with Ellis.

The scheme worked like a charm. In a few minutes Smith was telling Ellis how anxious he was to find some good shooting in order that he might return to Lenox with a large bag of game, and intimated, of course, that he had rather give anything than fail. The bait was attractive and was swallowed at once. Ellis said he had five partridges he would sell for fifty cents each, although he had been getting $1.50 apiece for birds owing to the risk, for it would cost him $100 if he should be caught selling live birds. This offer was made, however, with the understanding, Ellis said, that the hunter from Lenox would do "the right thing." How much Ellis might have been influenced by visions of Lenox gold and a new customer from the hill town of palaces, can only be conjectured. The fact known is that he offered the birds for sale.

Smith made some excuse to get out for a few minutes, telling Ellis he would return immediately for the birds. He went down the road to where Nichols and Putnam were waiting, told them how the land lay and then returned to the house. They followed almost immediately and arrested Ellis. The latter was taken to Great Barrington, where he was tried and convicted yesterday. The penalty fixed by the court was $100. Ellis could not pay this and was sent to jail. For a first conviction under the non-sale law, this result must be a lesson to be heeded by others who are disposed to monkey with the buzz saw. There is occasion also for all sportsmen to bless their stars that the judge who had this case to deal with knows the law and realizes the importance of its proper enforcement.

Out in Gilbertville village, in the town of Hardwick, Deputies Lennan and Shea secured the conviction last Saturday of two ferreters, who were fined $20 each. This also required a bit of detective work. Lennan, who was busy distributing fish, got a hint that parties in Gilbertville were hunting with ferrets. He and Shea took a day off, went over to the village, worked up the evidence, had the two fellows in court Saturday, and they pleaded guilty and were sentenced as above stated.

Game Warden J. I. Mills, of Ayer, with the assistance

of a local officer, arrested three ferreters last Saturday night and had them in court yesterday. In this case the judge gave the defendants all the benefit of doubts, for he convicted only the one who had the ferret on him, Fred Hall, who was fined $20.

When we add to the above three Sunday hunters arrested and convicted by Deputies Burney, Nixon and Rausch, and three others arrested and convicted at Fitchburg by Deputies Gibson and Proctor, for hunting last Sunday, it will be seen that the way of the transgressor is hard in this neck of the woods, even if some are able to escape the pinch of the law.

Nov. 21.—Since I wrote you on Tuesday there were arrested enough that I know of to bring our record for the week up to fifteen. On Tuesday, Nov. 18, Deputy C. O. Gibson, of Fitchburg, secured the conviction of Henry F. Boutwell and Clayton Morse for trapping trout out of season. They were fined $10 each. Yesterday (Thursday, Nov. 20) Deputies Bent, Dickerman and Stackhouse caught George W. Wilbur, of Norton, in the act of removing a partridge from a snare. Wilbur was convicted to-day at Attleboro and fined $30. In default of payment he was sentenced to sixty days in jail. As you will see thirteen of these arrests were for violations of the game laws—a pretty good record for one week, I think.

BAY STATE.

San Francisco as a Big-Game Center

How many cities of one-third of a million population are there in the civilized world, from which an unpretentious sportsman may start in the morning, with gun and dog, travel twenty miles or so by boat and train, and return by 8 P. M., say, weary to be sure, but with a fat four-pointer of his own killing?

"But, stay!" cries Didymus. "This buck was surely killed in some preserve or other, where he and his fellows are fed and housed and generally molly-coddled during the close season, until they become as tame as sheep or cattle?"

Nay, not so, thou eloquent evangel of the scatter gun! The buck—he is but a symbol, standing for his kind—was wild enough; the brushy, rock-ribbed fastness that was his natal spot, his home, and served him as a death couch, was, and is, private property, doubtless; but land over which any sportsman, any well-conducted man—the former term embraces the latter—may hunt freely for the asking.

Come, members of FOREST AND STREAM'S big family, far scattered over land and sea, speak up! How many large cities are there in North America or Europe where, within twenty or twenty-five miles of the municipal buildings, the plain, every-day man may be reasonably certain to bag his deer—yes, and enjoy a fox hunt, too, if so minded, after foxes that have never known the inside of a bag? Enjoy it—that is, if he can sit a horse on rugged ground. How many such cities are there, where the suburban resident may go lynx hunting with terriers any day, and feel sure, before he starts, that he will get at least one lynx? Or, where, with more time at his disposal, but still within the twenty-five-mile radius, he may get a shot at a bear? Or, less frequently, a panther? Marin knows but one—San Francisco.

The proof? Fish out your atlas from the lowest book shelf, where it lies wedged between the encyclopedia and the ponderous Greek, Latin, French and German dictionaries you used at college. Turn to the map of California. Mark San Francisco on her rock-bound peninsula, girt by bay and ocean. Measure off twenty miles to the south, and you are in the mountains of San Mateo; a scant twenty, eastward across the bay and from Mt. Diablo's summit (3,064 feet), you may survey a marvelous scene, a great city with the shipping of all nations within its portal on one hand; on the other, a wilderness of gulch, fen and forest; a bare twelve miles due north and you stand upon the slopes of Tamalpais, looking for all the world to-day as it appeared to Sir Francis Drake when, in the long ago, he careened his ship, "The Golden Hind," within the little bay named for him, embraced by its giant arms.

It startles even an "improved Easterner"—i. e., one who has been transplanted in salad days to California soil—to pick up his morning paper and read that such a one has been lost in the cañon (about twenty-two miles from the City Hall), and has wandered around for two days trying to get out! And yet such items frequently appear, and, unlike much that the daily papers publish, these are facts. Marin knows this, for he floundered about in one of the eighteen gulches which lead into this same cañon all one afternoon and the greater part of the night; and he has swapped experiences with other victims of the "getting-lost" habit.

Tamalpais, and especially the cañons, ridges and spurs to the north and northwest of this grand old mountain, form one of the finest natural game preserves in the world. The old Spanish grants, if they served no other useful purpose, by fostering endless litigation and keeping out settlers, have served to preserve the primeval wilderness as God made it. As it was before the Gringo came, so is it to-day—cattle raising is the chief, almost the sole, industry of this region. One cannot walk a quarter of a mile along any of the trout streams there, without seeing deer tracks; nor take a five-mile tramp over the hills in close season, without seeing a deer; probably two or three. A man named Bourne, living at Bolines, a small watering place twenty miles from San Francisco, has made a practice of hunting bear with hounds every winter, save last winter. Two years ago he killed three in about as many hunts. On the first day of the trout season this year, Marin saw fresh bear sign, not twenty-five miles from San Francisco. Some five years ago, on a foggy morning, when he was after quail, he saw a panther within the corporate limits of San Rafael, a town of 3,500 inhabitants, about sixteen miles from the city. He has seen their spoor repeatedly. The custodians of Golden Gate Park, in order to save the quail which frequent that haven of refuge, make a regular business of poisoning and trapping wildcats, raccoons, foxes and coyotes. These animals are so common to the north of the bay that it is of almost daily occurrence to run across one or more of them when quail shooting. Whenever in winter there is a phenomenally high tide, the duck hunters find drowned mink in the tules. Once Marin saw otter sign by a little stream on the slope of Tamalpais; and, upon another occasion, he caught a glimpse of what he took to be a fisher, beside a tiny pool among the redwoods, not eighteen miles from the city.

Is the evidence strong enough to support San Francisco's claim as a big-game center? "But," cries some doubting Thomas, "surely San Francisco's wealthy citizens who are fond of field sports have obtained exclusive control of the shooting privileges of this big-game territory at their very door, and the man of modest means stands about as much chance of getting his deer there as of bagging an elk in Central Park?" Not so; or rather, only partly so. There are three clubs of sportsmen, it is true, which control thousands of acres of good deer, quail, duck and snipe ground in the Tamalpais region; but there are tens of thousands of acres equally good where the young professional or business man who cannot afford heavy club dues, or the mechanic or artisan with only a couple of recreation days at his disposal, may go and, if his legs and lungs are sound and he can shoot straight, return with his quarry. Dwellers in this pent-up East can scarcely realize the condition of affairs that obtains here. Perhaps it may help them to state that there is one ranch in this Tamalpais district which is said to contain 70,000 acres! Plenty of elbow room on that one tract for a dozen clubs, one would think. The result: Every Californian boy learns to shoot a rifle about the time he learns to walk, as sundry Filipinos found out to their physical detriment, and, let us hope, to their moral enlightenment as well.

By the by, has it ever struck brother Didymus that the real end and object of all this floundering through Maine woods, all this hard riding and harder scrambling over Rocky Mountain ridges, is not the securing of a moose or elk head. Were this all, then Marin for one would lay aside his rifle, and advocate with all his might the passing of a law prohibiting totally the killing of big game within the United States for the next ten years. But there is a purer, nobler, less personal purpose that the big-game hunter, if he be a thoughtful man, keeps ever in view He seeks—not a trophy—but new health and strength, to persevere on his alloted life task to the end; the whisking away of mental cobwebs, city spun, by brushing up against nature in her more rugged mood; the broadening of his intellectual compass by close personal communion on trail and in camp with men, whose stock of book lore may be scant indeed, yet who are good men and can teach him many wholesome lessons—for example, that patriotism and good citizenship do not always walk abroad in broadcloth, and that there is a deal of hard-headed common sense stored away in odd nooks and corners of our country, where the screech of the demagogue never reaches. He returns from his outing mentally and physically refreshed: a stronger, clearer-headed man for it; a better husband and father; a better, because a more enlightened, citizen; a stauncher American, because his pride has been appealed to and he says to himself, if this man with whom I have shared my camp and who, judged by worldly standards, is my inferior, loves our country so well that he would freely give all he possesses and his very life ere the minutest speck of dishonor should rest upon her, how much the more is it my duty, in my larger sphere of usefulness, to cherish her fair name, and upbear the arms of her elected and appointed guardians. The purpose of the younger hunter ought to be, and no doubt is, to train his eyes and nerves, to harden his muscles, to inure himself to hunger and fatigue, to learn to shoot in fact—for that includes the others—so that he may the better defend his home and the Republic, should she need him. Any attentive reader of the story of the Anglo-Boer war, need not be told that military marksmanship cannot be taught on a rifle range, nor that it can be taught most effectively by a life-long pursuit of big game—but Marin has strayed far afield.

On Friday afternoons and Saturday mornings it is a pleasant sight to see the ferries thronged with bright-faced, clean-cut youngsters, with gun and hound or pointer, or collie, perhaps, bound for the woods and gulches of old Tamalpais, in quest of deer. Marin, albeit no chicken, tried it himself last week, and just to demonstrate the truth of the proposition that San Francisco can make good her claim, here follows the story of that little hunt.

Accompanied by a young Southerner who had never shot a deer, he took the ferry, then the train, and in one hour after starting, they were seated in a light vehicle bound for the Jory ranch, on the north slope of Tamalpais. Distance to ranch from San Francisco, as the crow flies, about sixteen miles. At three that afternoon, they sallied forth, Marin, Dixie and Jory's twelve-year-old boy, with a pair of two-year-old dogs—half fox hound, half fox terrier, a likely combination. As the dogs had never hunted, Marin took them through several gulches, first stationing his companions on the ridge. The first three cañons proved barren of deer. About 6 o'clock the bitch—she was the better dog—jumped a very large buck in thick timber at the head of a small gulch and ran him through the short brush, past Dixie, who did not shoot, for reasons which will be at once apparent to anybody who recalls his first deer hunt. Five minutes later, from the same gulch, the dogs jumped two deer—a doe and a spike buck. Marin caught a glimpse of the spike, fired through the trees at him and missed. He turned up the ridge, and almost ran into the kid, who bowled him over with a nice, clean shot through the foreshoulder. Then, as he kicked a little—it was the boy's first deer—he emptied his Winchester into him and hallooed for help! When Marin reached that spike he was very dead—two shots through his heart, a broken back, to say nothing of four minor wounds. Then Eddie learned his first lesson in deer hunting: "When the deer is down in open ground, quit shooting—he's your deer."

Sunday they did not hunt, but on Monday morning Dixie and Marin were up betimes and about 9 A. M. the good little dog ran a buck across the brushy ridge upon which they were standing. Dixie saw him first and fired three shots, which turned the deer, and then Marin's armament came into action and his second shot broke the buck's neck. The post-mortem disclosed that one of Dixie's shots, probably the third, had scored his right forehoof. He was a nice fat buck; his antlers irregular, 3-2. A horse was procured; but it was a wearisome job, getting the horse on the ridge and packing the deer out. They reached San Francisco before 8 o'clock that night with their quarry.

Surely, enough has been said to prove San Francisco's case? Plaintiff rests.

MARIN.

SAN RAFAEL, Cal.

CHICAGO AND THE WEST.

Game Laws and Game Birds.

The *Game Laws in Brief* came pretty near trouble this week here in Chicago. A tall stranger from the lower part of this State, the country more or less commonly described as "Egypt," appeared in the gun department and asked to see the man who sold *Game Laws in Brief*. He was met by that interesting gentleman, Mr. Hirth, who blandly inquired his wishes:

"Do you-all sell these game law books?" said the stranger.

"We do," said Mr. Hirth, politely.

"They're wrong," said the stranger. "What's the use in puttin' out game laws and not doin' it right?"

This remark raised the sporting blood of Mr. Hirth to the boiling point, and he at once dived into his trousers pocket for the roll of bills which usually reposes there.

"I'll bet you a hundred dollars to your shirt stud," said he, "that the *Game Laws in Brief* are all right, and I can prove it."

The stranger didn't relish the sight of so much money and backed out of the store, but two days later he showed up again.

"I've got you," said he, "and I'll show you how."

"Do it," said Mr. Hirth, reaching again for his roll.

"Why," said the man from Egypt, "I've looked it all over, and it don't say a word about the 'possum."

You should have seen the scorn upon Mr. Hirth's expressive countenance at that moment. "Sir," said he, with icy dignity, "in the best sporting circles of this country the 'possum is not rated as a game bird. It may be in your country, but not in Chicago."

And yet the stranger was not convinced. "Any book," said he, defiantly, as he departed, "which don't take account of the 'possum is dead wrong, and that's all I've got to say about it."

Live Fox Hunt in Chicago.

It is known to at least a few Chicago sportsmen that there are red foxes to be found once in a while in the sand hill country along the shore of Lake Michigan below this city. Perhaps it was from this wilderness of sand dunes that there came recently the red fox which yesterday morning came well nigh to disintegrating the police force of Chicago. Policemen McGrath and McNamara, of the South Chicago station, saw this fox in Jackson Park and caught it, confining it, on the charge of vagrancy, in the police station. True to its nature, the fox verified the charges by continuing its vagrant life, jumping through a window and pulling its freight toward the open woods. The entire police force of that part of the city was notified and joined in the chase.

"You're all wrong," said McNamara to McGrath.

"Pfwhy?" said the latter.

"Ye didn't ought to wear a blue coat in a fox hunt."

"And phwat sort of a coat, thin, should I be wearin'?" said McGrath.

"Pfwhy, a rid one, to be sure," said McNamara.

"That's British," said McGrath.

"It don't make any difference," said McNamara, "if it is British. It's right in a fox hunt. They do it in Boston, too."

"There's nothin' British that's right," said McGrath. Whereupon they clinched, and for a time delayed the operations of the fox hunt. There were enough officers left, however, to pursue the vagrant, and finally he was cornered in the prairie adjacent to South Chicago and taken off in the patrol wagon. As a sporting center Chicago still continues not without interest.

An Exciting Jacksnipe Hunt.

Our jacksnipe flight seems all to have left us for a warmer and wormier land, and the most we can do is to sit around and talk about or write about the days which used to be. This sort of thing brings to mind the famous jacksnipe hunt, which was a few years ago engaged in by certain personages of this city, no less than the Hon. Hempstead Washburne, formerly mayor of Chicago; Mr. J. V. Clarke, President of the Hibernian Bank and formerly president of the clearing house here, and Mr. Charles Spalding, son of Mr. Jesse Spalding, one of the heaviest lumbering operators in this part of the country. These three gentlemen went to the snipe country adjoining Shelby, Ind., and pursued their sport during the first day with varying success. It was the first time Mr. Spalding had ever been shooting, but he didn't shoot anybody that day, and all were happy in the evening when they reached town.

It seems that there was a political campaign in progress at Shelby, and anyone who knows the exceeding hotness of the average Indiana political campaign can get an idea of the local enthusiasm which obtained at that time. In some way or other the names of these distinguished visitors got out, and forthwith they were waited upon by the local committeemen, who insisted that nothing would do but that each and every one of the Chicago men must make a political speech at the giant mass meeting which was to occur at the town hall that very night. Mr. Washburne was to speak upon the virtues of an enlightened government of the people, for the people, and by the people, and that sort of thing; Mr. Clarke was to speak of the gold standard in our national currency; Mr. Spalding was to make a stirring address upon the evils of free trade as applied to the lumbering industries of the State of Wisconsin. All this was nuts to Mr. Washburne, who is an old war horse in a political campaign, but it didn't go so well with Mr. Clarke or Mr. Spalding, who promptly expressed a desire to take the first train for Chicago. The committeemen, however, would not take no for an answer.

Ere long there was heard the sound of the local brass band, headed by an oompah horn, which fairly made the sidewalks rattle when it went off. Long lines of cheer-

ing and enthusiastic citizens lined the village street, bearing torches, and between these rows of expectant humanity walked the "distinguished visitors in our midst," two of whom, at least, felt that they were going to something worse than their own personal funerals.

"I thought you told me I didn't need anything but rubber boots," said Charlie Spalding to Mr. Clarke, his brother-in-law, as they marched down to the place of execution. "How would I look making a speech in rubber boots? How would I look making a speech in any kind of boots? I never made a speech in my life, and I'm not going to."

Mr. Clarke felt very little better. Mr. Washburne was gleeful, smiling and confident, but was so engrossed in thinking over his own remarks that he didn't pay much attention to the dejection of his companions. The chairman of the committee was nothing if not inviting. "Right this way," said he, to Mr. Clarke and Mr. Spalding. And he took them up a pair of dark stairs into the town hall. "Will one of you gentlemen give me a match?" said he. Having obtained the match in question, he started to light up the kerosene lamp, which was to furnish the illumination for the occasion. Unfortunately, the match went out, probably jarred out by the blare of the oompah horn, and for an instant there was darkness. A swift inspiration came to Mr. Clarke. "Duck!" said he to Mr. Spalding, and together they ran down the stairs faster than they had come up, and made their escape around the corner of the building. Mr. Washburne was not so fortunate. The committee got him, and the first thing his friends witnessed was the sight of the Hon. Hempstead Washburne, exalted upon the rostrum of a store box upon the sidewalk and addressing an overflow meeting, which had congregated and was now hanging upon the eloquent words of "the gentleman from our sister State of Illinois." The Hon. Mr. Washburne, they do say, was throwing it in to them a little warmer than he was ever known to do before. He had them all laughing, crying and shouting by turns, so that his speech is even to-day treasured among the household words and recited at the firesides of the Indiana men who heard its sentences fresh from the eloquent lips of the speaker. During his speech Mr. Washburne, who is always self-possessed and master of the situation in public addresses, discovered his two friends, Mr. Clarke and Mr. Spalding, peering around the corner of the house. They were spellbound for a moment, and Mr. Washburne, not knowing anything of their escape down the stairway, and supposing that they were willing to go on with the programme as laid out earlier, finished his speech in something the following manner: "In conclusion, my dear friends and citizens of our sister State of Indiana, I will introduce to you my friend, Mr. J. V. Clarke, a well-known business man of the city of Chicago, who will now address you."

He turned, waving his hand gracefully toward the spot where but a moment before he had seen Mr. Clarke peering around the corner of the house. He turned, looked, and looked again. There was no face at the point where but an instant before he had seen two faces. A sound of rubber boots was heard in the distance. Mr. Clarke and Mr. Spalding had disappeared once more! No one has ever explained how Mr. Washburne got out of this difficulty into which his friends had thrust him, but the inference is that he did so gracefully, logically and decisively. None of the three ever talks a great deal now about the great political jacksnipe hunt at Shelby, Indiana.

A Big-Bore Believer.

I am very glad to have the following letter from Mr. N. T. De Pauw, of New Albany, Ind., who has the proud distinction at this date of killing the record moose of the season in New Brunswick. There is little doubt that this is the record head for the entire known moose country outside of Alaska this fall. He killed his moose with a big-bore gun and has this to say about the transaction:

"I feel that I must thank you for your very kind notice of my big moose in FOREST AND STREAM. As you must know, my hunt with Uncle Henry was just as fine as it could be. He certainly has an excellent territory and is certainly a great man to hunt with. Your article is unusually correct, but you are a little wrong as to the height of the moose. It was 7 feet and 1 inch tall at the shoulder; and you are also wrong as to the rifle used, and especially are you wrong when you say I "came out of the woods a big-bore convert." My rifle is a .450 single, hammerless ejector cordite express, shooting 70 grains of cordite and a 480 grain bullet. With a less powerful rifle I am satisfied I would not have gotten this moose. He hid himself from us behind a thicket of small spruce trees, so that my first shot, before it struck him in the chest, went through one small tree and cut the edges of two others. My second shot, as he wheeled, before it struck him in the left shoulder, cut the edges of two trees.

"I am not a recent big-bore convert. Ever since I read Van Dyke's 'Still Hunting' and thought over his remarks about killing game quickly, if it was killed at all, I have been a big-bore man for big game. Not satisfied with a .45-70 and later a .45-90, I imported .577 cartridges and persuaded the Winchester people to build me a rifle for them, the one you saw in Henry's home camp. The execution of this rifle was everything one could desire, but its recoil was very unpleasant. As soon as the new high power rifles came into market I purchased one, I think the third one that Mr. Funke brought to this country, and followed this up with others as they came out. Three years ago I purchased a .375 cordite, shooting 40 grains cordite and a 320 grain bullet, with a velocity of nearly 2,200 feet. Using this rifle, I lost an immense moose last season with a much easier shot than I had at the big one this year, because the .375 bullet was broken up and deflected by some small bushes between me and the moose. I then determined that I would never go moose hunting without a rifle powerful enough to kill my moose and kill it quickly. As soon as I returned from my trip I ordered the .450 cordite and believe it to be the ideal rifle for moose hunting. Its accuracy could not be improved upon. It only weighs 8½ pounds, and yet shot at game, I did not feel the recoil. It can be taken apart and cleaned like a shotgun, and is so simple in construction that there is hardly the possibility of its getting out of order. I should like very much to have you see it."

A Small-Bore Believer.

So much for the big bore and moose killing with the big-bore gun. Here is the other side of the big bore-small bore argument, presented in a letter from Mr. Chauncey P. Williams, of Albany, N. Y. Notice the two Albanys, and witness the divergence of the two in regard to the caliber of guns! Mr. Williams writes as below:

"Permit me to thank you for the pleasure I have experienced in reading your 'Across New Brunswick on Snow Shoes,' concluded in the current issue of FOREST AND STREAM. The narrative has been of special interest to me, as I have hunted over some of the country you describe. I was at the Nictor and Bathurst lakes before there were any permanent camps there, and I tramped over nearly all of the surrounding country. The snowy part of your account also appeals to me, as I hunted with George Armstrong, of Perth, N. B. (whom I expect you met at the Chicago Sportsman's Show of 1900), on snowshoes in three feet of snow on the divide between the Tobique and Miramichi, and slept out at 15° below zero. On that occasion my luck was rather better than yours, as I succeeded in killing a moose with antlers spreading 63 inches, 16 points on each side and palmation 19½ inches wide. What Uncle Henry would have said then one can only surmise, as that moose fell to but two shots from a .30-30 Winchester. Experience, which I will not here attempt to relate, has made me a convert to the small bores. I find it quite a general rule that the most strenuous opponents of the small bores are those who have never tried them, or at any rate, have not tried them intelligently.

"Did it ever occur to you that the construction of the New Brunswick snowshoe might be accountable for the scarcity of toe nails in that province? The N. B. snowshoes that I have seen and used have had a short toe space from front to rear, so that if the tie loosens up a little the toes in going down will sometimes strike the forward cross piece of the shoe, thus causing the toes to become bruised in continued walking. On the occasion of the winter hunt mentioned above, I used a pair of snowshoes made in the Adirondacks which had a toe space of twice the depth of that in a N. B. shoe, and although I wore the New Brunswick tie all the time and carried frequently heavy loads, my toes caused me no discomfort. On other occasions I have worn the regular New Brunswick snowshoe with the shallow toe space with the same tie and footgear as before, and have caused the loss of my toe nails in a few days' traveling. I generally do some snowshoeing in the woods every winter, and have always suffered less from sore toes when wearing shoes having the long toe space than when using those with a short one.

"Your record of the Bear family was also of much interest to me. I met Tom Bear at the Bathurst lakes in 1897. He was considered a good guide (the Indians were about the only ones in the business then), but was the terror of Indian Point at the mouth of the Tobique when drunk, as he was pretty sure to be after his return from a trip into the woods. Old Noel Bear, Tom's father, I saw at Riley Brook not long afterward. He had just emerged from a stay of six months or so in the woods, where he lived on the country, and I was told that he was the only Indian remaining who could do so. He came to the settlements about twice a year, this being one of those occasions, and he had his small and very dirty tent pitched in a fir thicket beside the river, where he staid in preference to quarters under a roof.

"In FOREST AND STREAM of Sept. 27 (p. 250), I noticed that you tell of genial Adam Moore's saying that 'no Indian and no guide who knows his business would think of leaving the waugan stick standing by the fire, etc.' In the preface of 'Chiploquorgan, or Life by the Camp Fire in New Brunswick and Newfoundland,' a book written by Captain Richard L. Dashwood, and published in Dublin in 1871, occurs the following: 'The word "chiploquorgan" is the Indian name in the Milicete language, for the stick on which the kettle is suspended over the camp-fire, as depicted on the cover of this book. The Indians attach a certain degree of superstition to the chiploquorgan, and it is considered most unlucky to burn or remove it on leaving camp.' Captain (now General I think) Dashwood, in the course of his fishing and hunting expeditions, visited Nictor Lake in the sixties with an Indian, whom he usually had for a guide, and from whom he undoubtedly gained the information above quoted. Times must have changed for the kettle stick as well as for many other things connected with sports of the field in America. The next time you try N. B., may be, if you leave the chiploquorgan standing, it will bring a moose that has not shed his antlers."

So much for both sides of the matter. I presume it is very much a matter of prejudice in these things. Personally, I am so horribly American that I cannot shoot anything but a lever action gun. I would not know what to do with a double barreled rifle, but perhaps might come to like the arm very much if I used it. The Winchester people are crawling up to caliber .35 now, and maybe after a while they will give us one of Uncle Henry's tomato can loads for those who like that sort of thing.

As to settling the question of small bore and large bore, it will be a long cold day before that is all over with. The small bores, perhaps, do not act the same in every instance, that depending largely upon the character of resistance the bullet meets in the body of the animal. Nor will one be apt to find a series of big game animals of any one species in which all will act precisely alike from the same wound. It is a matter of history that the bad men of the West were hard men to kill. They simply would not stop shooting even when cut to pieces. Other men have been killed from a shot in the foot or in the hand. It must be a good deal the same way with moose. As to the unfortunate animal, of whose undoing I was the unwitting agent, it is of record that Uncle Henry said the moose would have died pretty soon, anyhow! And there you are. Mr. Williams speaks golden words about snowshoes. I don't like the shallow toe hole, nor see the necessity for it. About the "waugan stick," I know only the tale as told to me.

New York's Non-Resident License Law.

We have been having considerable trouble and perplexity this fall over the status of the Minnesota wardens in regard to the enforcement of the non-resident license law of that State. As correctly reported in these columns, this law cannot be enforced against shooters coming from a State which has not upon its statute books a non-resident license act. The question is, where do you find such a State? Several gentlemen wrote me from New York saying that they felt exempt from this non-resident clause in the Minnesota game laws, on the basis that the State of New York has no such thing as a non-resident license law. The Minnesota wardens none the less enforced their own law against New York shooters, and Mr. Fullerton was able to inform several inquirers from the State of New York that their own jealousy for their sister State of New Jersey had made it uncomfortable for some of the New York gentlemen who wanted to shoot in Minnesota. As I understand it, there are some county laws which are enacted in retaliation against the shooters of the State of New Jersey, that State having established a non-resident license for herself. Probably the framers of this tit-for-tat legislation did not think of its working as far west as the Mississippi River.

The President's Bear Hunt.

CHICAGO, Ill., Nov. 20.—It is matter of regret for every sportsman of the South—or of all America for that matter—that President Roosevelt did not succeed in getting a shot at a bear in his Mississippi bear hunt; or that he did not achieve his more probable ambition of getting into a mix up with the dogs fighting and holding the bear in such way that some weapon of shorter range than the rifle might be used effectively. As it was, the luck of the chase was against the President, as well it might be on so short a time limit as four fractional days. Not even the boundless hospitality of the South—and we may be sure that the South did its best—could cover an exigency like that and furnish a bear on such short notice; not unless it was a bear not *ferœ naturœ;* and no other hardly need apply. One may ride sometimes for several days before he gets into the final stages of a canebrake bear fight, which nearly always has the faculty of going the wrong way and leaving one out of touch and hearing. The race is not even for the swift in all cases, for it matters not that one knows which way the pack went, if one does not know the path or bayou or naked ridge which will make it possible for him to get across to the place where he hears the pack. In the canebrake one must know how to ride and how to take switching and thumping, but there is no such thing as cross country riding, or riding straight to the hounds. The man acquainted with the lay of the ground, the paths and "hocks," as well as with the average direction of the game when started in a given locality, is the one who has all the advantage. The real sport of this sort of hunting, however, is in hearing and trying to follow the chase. The kill is the tamest of it all. It is thought that President Roosevelt had the pleasure of hearing more than one chase, and of seeing the interesting methods of the canebrake hunt for bear.

It is perhaps not in just the best taste to suggest that had President Roosevelt's hosts located the hunt further to the north, in the bear country of Capt. Bobo, success would have been more nearly certain. Bobo would have wanted a week, but he would have delivered bears in assorted sizes. He was in camp on a hunt at the time the President was at Smedes, and report comes that he had killed eleven deer and four bears. I do not understand about the deer being killed, nor know why so few bear were killed, but suspect Bobo was not on a hunt by himself.

For Governor Longino to ask Capt. Bobo to come to Smedes was really an injustice, for neither Bobo nor his dogs would know that country, and a hunt there would have cost Bobo part of his reputation, at least with the ignorant, and would have cost him also most of his dogs. The thing to do, from the Bobo standpoint, would have been for the President, the Governor and all their suites, to come and live with Bobo. Then surely there would have been doings. I know personally that Bobo is disappointed that the party did not bring the hunt to his country. I am sure Bobo figures that in some ways he is as good as any governor; and there is more than a suspicion that even the President of the United States would have to outride Bobo if he got a shot at the bear; but that is all the better game for the President, who is himself a sportsman. As to Bobo and his principality, in Coahoma, I would far rather have his job than that of any governor there ever was in all the United States; unless, perhaps, it were of the Free State of Franklin, which is no longer on the map. It is only fair to those of us who had President Roosevelt's success at heart to let us hope that he will try again after his bear, and that before the railroads have ended the hunting in the Delta; and also that he will give a chance next time to the governor of Coahoma and its provinces on the Sunflower.

Ducks.

The feature of the week's wildfowling was a very heavy flight of ducks which crossed the latitude this week, going very high and not stopping. This is perhaps the last of the northern birds, for there has been a sharp freeze in upper Minnesota and Michigan, and in the former State the ice was strong enough to hold up a man on Monday of this week. That was in Beltrami county. In spite of the hurried exodus, a great many birds have been in this week on Fox Lake waters, and some fair bags have been made there. Mr. Eddie Pope got seventeen redheads and bluebills one day. Mr. W. L. Wells left for there day before yesterday. Nearly every one else has been there who can stand so much company. On one day this week seventy-five boats were in sight at once on Fox Lake, and thirty-seven hunters stopped at one hotel. That shows how badly folk want to hunt. Some few got a few birds.

Quail.

Quail are a poor crop in Illinois on the face of the returns thus far. We have been spoiled by two years of

abundance. In a few days, however, after the vegetation is down in lower Illinois, we should hear of better sport. It has been fair and warm, with few frosts thus far, and the week just past has shown a good brand of October weather.

To-day I got a telegram from State Warden Fullerton of Minnesota to "start at once" for his city, for a quail hunt. It seems a bit far to the north for quail, but as I am curious in regard to that, and as the invitation seems to come in the nature of a command, I reckon I shall have to go, however much against my will. We shall see about this rumored invasion of Minnesota by Bob White.

Minnesota Deer Season.

ST. PAUL, Minn., Nov. 22.—The Minnesota deer season is now at its height, but it is not yet time to tell much about the totals, for the parties are not yet out of the woods, and returns are not in. One St. Paul party came back this week with eleven deer. I saw one hunter come in with three deer this morning. Mr. P. O. Stephens, of Detroit, Minn., is in camp near Ilasca Park with three friends. On the 17th they wrote down that the country was full of deer. They had killed five at that time, in the first week of the season, and said that the snow hanging on the bushes made it hard hunting. They expected good hunting in case of a wind, which should free the undergrowth of snow.

Moose.

Minnesota has moose, lots of them, but its resources are not fully exploited. One can go into the northwest part of the State, or the extreme northeast part, the latter being the easiest place to get a moose. Then there are Tower and Grand Rapids, two of the more usual points of entry to the woods. I do not discover any regular system of guides or camps.

On the St. Louis River last fall, a young photographer of this city got pictures of seven moose in a run of twenty miles.

Word is in to-day from Mr. Frank Cyr and party, who are in at Crane Lake Portage, this State. They now have two fine moose and six deer hung up, the moose having good heads.

Wisconsin Game Law.

Things do not look as well in Wisconsin as they might this year. Here is a State which, with appropriations and license fees is thought to have had a fund of over $70,000 last year available for purposes of game protection. Its laws, while not faultless, are, at least, not so bad as they might be, and have been put on the statute books after hard fighting and hard thinking. In short, the hardest stage of the fight for game protection was won in Wisconsin, as her spring shooting law alone might indicate. It is, therefore, a matter of regret to learn that the discontented, thoughtless, selfish element which has always caused so much trouble in Wisconsin, is now stirring up trouble over the game law, and will attempt at the next session of the Legislature, to amend them to the point of rendering them practically wide open. The first fight will be to abolish the law which prohibits spring shooting. The market hunters and dealers in game will attempt to still further modify the existing statutes. The best features of the Wisconsin laws are due to the earnest efforts of a small but devoted body of sportsmen, and it would be evil news to hear that all their work had come to naught. It is time to rally again. Watch this next Wisconsin Legislature.

Hard Luck for Donnelly.

At 3:30 to-day Judge Finehout denied the motion for new trial of Stanislaus Donnelly, attorney, under the Bentner administration, for the State Fish and Game Commission of Minnesota, who was earlier found guilty of killing two ruffed grouse out of season. (These were the birds discovered by chance on a sleeping car early last September.) Mr. Donnelly says he will go to the Supreme Court. His defense is that of ignorance of the law.

Heavy Bags of Ducks.

CHICAGO, Nov. 21.—The Powers boys, of Decatur, Ill., owners of a fine bit of duck marsh in the Illinois River valley, are stated to have turned out recently the modest bag of over 800 ducks, mostly mallards. These are the men earlier mentioned in these columns as having sold 1,900 mallards one spring, all these killed in a short time. It is understood that the Powers boys put up the plea that their marsh costs considerable to keep up, and that they need the money. I have a great deal of sympathy for a fellow who needs the money, for all of us have been broke and up against it now and again, but the sentiment of American sportsmanship bars from its ranks men who choose to make a living at market hunting nowadays. There are so many better ways of getting on in the world in these progressive American times. In the old world a prince or king or emperor may kill his hundreds of pheasants in a day, his "80 rabbits in 20 minutes," as is credited to the German emperor, who also sometimes shoots down 50 wild boar in a day, the boars being driven pasth im along a fence. A man may do that in Europe and be a king. He can't do it in America and be a two-spot. The Powers boys have no cause to feel aggrieved that the sentiment of the American sportsmen unhesitatingly condemns them. It is not the sentiment which is wrong, but they themselves. Now, wouldn't it be much nicer of them just to stop selling game, and to put a daily limit to the bag on their own marsh, and make it a reasonable one? I promise them, when they begin to do this, they will find themselves entering upon a new world of enjoyment, whose delights they have not yet dreamed. It will mean that they will really have a much better time. When these men can announce to the sportsmanship of America that they have stopped slaughter and stopped sale forever, at home or abroad, it will surprise them to see how many hands of friends will be reached out to them. It will surprise them to see how much better times they will have then than they have now.

Two Men in a Box.

IT is not always that we can look for new experiences in life, and in order to know as nearly as we can just what we are going to encounter, that we can secure a treatise to fit the occasion, and thus combine the theoretical with the practical and make them dovetail.

Being in search of new sensations with the shotgun, it occurred to me that I should accept an invitation sent me from Bayport to shoot ducks from a battery, and not caring to appear wholly as a novice, I decided to read up a bit on duck shooting, so I secured a copy of Mr. George Bird Grinnell's "American Duck Shooting," and immediately studied this particular method of bagging these suspicious yet foolish fowl.

Mr. Grinnell describes in the most complete detail the exact way in which it is done, and his plates show precisely the position of battery and decoys, even to the brant extras as a base to your submerged lonesomeness. So exactly alike did I find his descriptions and Capt. Le Roy Still's wooden distributions that I openly accused the captain of having read the book, but he only insisted that if Mr. Grinnell described it that way he did it right. Thus do learned doctors sometimes agree.

It would be, however, impossible for the author to have furnished sensations enough to go around among the thousands of sportsmen who have had, and for all time to come will take, their initiative sprinkling in a Great South Bay battery, and it is of these sensations that I would speak.

Battery shooting is a poor cure for nervous diseases. This can be proven by Mr. Chas. Keith and vouched for by me, because I did not fortify myself against snake bites and chills and fever. The close proximity in which one comes in contact with his neighbor in a double battery should make one as careful in selecting a companion for this sport as in choosing a wife; for, in addition to treading the same plank with four feet, there are four barrels loaded, and nearly always within a few inches of those same extremities. However, I am glad to say that in this particular case nothing disagreeable happened except missing, and this was done so often that I wondered that many of the ducks didn't come back just to see what had scared them. They must have been nine-tenths drakes.

Mr. Keith and I were carefully stowed away in that winged box, and were told to lay low and keep quiet; and this we proceeded to do, while Capt. Still boarded the sloop and sailed away. And right here I got my first real impression of helplessness of man, under certain circumstances. Through the mist the great red sun appeared just between our feet. From the distance there came bounding across the bay the weird call of the loon; and in another direction the metallic whir of thousands of powerful wings, as those vast myriads of ducks, disturbed by an approaching sail, broke for new quarters; while our frail and heavily freighted craft slopped in a choppy sea as though the burden were too great to bear; and I wondered what they were doing at home, and how much they would miss me. It was at this stage of thought that Mr. Keith, being short of stature, but striking a real manly average in thickness, suggested that I, being of slender build, do a bit of rubbering, which I did to my further discomfort, as there was nothing in sight except wooden ducks and water. A thin veil of mist had shut out even the friendly sun and swallowed up the sloop. So I went back to the dear ones at home, dried their eyes, assured them I was still here, but didn't know how long I would be; and just then one little roller escaped around the corner of the floating screen at our head, landed just under my ear and came out in my left boot, as five hundred broadbills swung around our decoys into the wind and tried to see which one could light nearest to our tailboard. I felt smothered, yelled at Keith, grabbed my gun and shot in self-defense, and won out handsomely—saved myself and every duck there, except that one fool duck did get panicky, and Keith dined on him a few days later. It was a new game to me, the action of the battery on the water, the suddenness of their arrival mixed up with a kindly remembrance of all my past friends unnerved me; and flight after flight escaped me, until I determined to overcome all sensations and get down to business. So the chills and ducks passed on until neither were in sight, and I boarded that sloop with a predominating sensation of hunger and disgust.

After lunch I insisted that Capt. Still take my place, as I liked sailing better. Keith now being with a veteran duck hunter and wanting to be just right, asked the captain after they were stowed away if his head was low enough. "Yes," said the captain, "your head is all right; but reef your stomach. The ducks will think they are going ashore on a sand dune." Nothing, however, short of a forty-four-pound iron decoy could have brought about the desired result.

At three in the afternoon I relieved the captain and proportionately relieved the danger to the ducks. At this time they began coming in in small crowds, occasionally a single or double, which made very interesting shooting, especially for the right-handed shooters, which wasn't I, and Mr. Keith had lots of fun, the position of the battery being to the right at the thicker end of the pear-shaped decoy plant. I, however, gained sufficient confidence that the battery would hold up till night, so that I made some very satisfactory kills; and boarded the sloop a few moments before sundown with a feeling that after all it was a waste of money buying accident insurance.

Venison steaks at the Bayport Hotel later completed fully a day of mixed emotions, and dissipated for the time being at least my early morning fears. At three thirty the next morning found us pulling on the boots of confidence and prepared for anything from ducks down to the very near bottom of the bay. A moon set and a sun rise going on at the same time are a greeting to the early riser, and, in fact, to all mankind who will partake of these early luxuries well worth seeing. It was a morning brimful of promise, overflowing with beauty, furnishing other sensations than fear, and completing a regular holiday assortment of feeling; and we both felt glad we had come. The day proved a successful one, with good shooting and enough kills to feed bigger families than ours.

I must confess a fascination for this kind of shooting. To be sure there does exist a lurking element of danger, which can, however, be eliminated to almost an entire degree by the selection of a competent captain—one who notes the slightest change of wind or rising of the sea; one who carries a compass and knows how to use it, and whose bump of orientation is well developed. In such hands one is entirely safe. I believe Capt. Still to possess all these qualities, in addition to the numerous other conveniences at his hands. Calms or fogs have no terror for him; he goes just the same. An auxiliary engine in his sloop Ulrica assures the practicability of moving when it is time to move.

We arrived in New York Sunday morning, Mr. Keith looking the picture of the time present, his ducks showing the time past; I, with ducks and beard of two days' gathering, and drooping from the reaction of feelings intense. We wait at the ferry for a car, when a typical newsboy spies us, stops yelling his wares, looks us over and calls out to a fellow merchant, "Say, Jimmy, et's easy ter see which o' dem guys killed dem ducks, ain't it?"

THOS ELMER.

NEW YORK, Nov. 24.

Long Island Notes.

BAYPORT, L. I., Nov. 23.—The past week has been rather a disappointing one for ducking, the birds being very wild and difficult to stool, owing, it is said, to the very mild weather which has been almost like summer. But with the advent of the present cool spell and high wind the present week promises to be good. Quail shooting has been fairly good, a dozen to 20 being bagged with any ordinary shot. Guide Will Brown out on Thursday afternoon, ran into a covey of about 20 birds, 6 dropped with the first barrel and 1 with the second. He afterward bagged 6 more of them, which considerably reduced that covey. A very large number of gunners are expected here for over Thanksgiving, it being almost impossible to procure sufficient guides, and the more the south side of the island gets known I am convinced the more popular it will become with lovers of the gun.

The recent shooting accident in this village cast quite a gloom over the community, it being another instance of the danger of being careless with a gun; a lesson, no doubt, to a great many, but a very costly one at that. A youth of 19, the only son of a prominent business man here, out quailing with two companions, came to an apple tree. He took hold of the barrel of the gun and attempted to knock off an apple with the butt end and received the full charge in his stomach, and died almost immediately. It is the only serious accident reported this season in this part of the country. The deer hunting season closed (it was a very successful one) and not a single accident reported around here, which is rather unusual.

H. STOKES.

Currituck Ducks.

CURRITUCK SOUND, Nov. 18.—*Editor Forest and Stream:* Our opening day for ducks, Nov. 10, was as bright and warm as a summer day, and has continued so up to date. About 7,000 ducks were killed the first day and 2,000 the second. Since then the shooting has been rather poor. There has hardly been a ripple on the water during the past week until to-day, when we had quite a storm, and there are indications of cooler weather to-night. We have an abundance of wild celery and other foods, and when the weather gets right will have fine sport again. I think the Swan Island and old Currituck clubs have as many ducks in theeir marshes as they have had in many years, which is due principally to the protection they are given. About one hundred and eighty ducks to one gunner was the largest bag I have heard of. Personally I have had keen sport, and for the benefit of my brother duck shooters, I would advise them to purchase a Mullin's "Bustle" ducking boat if they expect to do pond or point shooting. I just secured one this fall, never having seen one before; and for this kind of shooting I think it has no equal.

Swans arrived about ten days late this season, but they came in abundance on the 15th and 16th. Canada geese are very plentiful, and there are the largest numbers of black ducks, widgeon and pin tails I have ever seen. Mallards are not so plentiful as last season, but we have more than usual. I am glad to see in FOREST AND STREAM that there are plenty of ducks north and east of us.

MORE ANON.

Vancouver Island Notes.
